<sup>12</sup> **Citation & Commentary:** **Joseph Simmons:** Listen, we weren’t on the Green this morning with the intention of fighting. **Adam Cooper:** Why did we have our guns? **Joseph Simmons:** To show them we had them. And that we would fight if need be. But there wasn’t a man there fool enough to think he could stand up against the British Army face to face. – *April Morning* (TV movie, 1987).

- ✓ Though the movie makes it clear that the *fictional character* Solomon Chandler, sneaking around the edge of the Green unknown to the combatants, fired the first shot at Lexington that led to the massacre and that all of the deaths on both sides that day are on him, the movie presents an interesting situation in which many decisions taken are the blame: the arrogance of the British, the decision of the British commander not to march past the Lexington militia and avoid confrontation (reminiscent of what Sir Lancelot said to King Arthur during their duel in *Excalibur* (1981): “You sir, would fight to the death against a knight who is not your enemy for a stretch of road you could easily ride around.”), and the decision of the committee to form the Lexington militia on the Green to confront the British column. Solomon Chandler, a firebrand revolutionary agitator, who seems to have appointed himself captain of the militia after the initial fight, and who was an inept weapons smuggler, a poor liar, and probably had an exaggerated reputation, degrades as a character during the last half of the movie as he seems to enjoy the killing. He, of course, dies in the end (‘live by the sword, die by the sword’) with a suitably patriotic message for the Cold War audience (this was a Hallmark production and made-for-TV movie) that I would have inhaled headily if I had seen this movie when it first aired in the late 1980s and exhaled slowly with a deep star-struck sigh for the youthful beauty of Meredith Salenger as Ruth Simmons.
  - History does not know who fired first, e.g., Derek W. Beck, “Who Shot First? The Americans!” *Journal of the American Revolution*, April 16, 2014 (available free online).

<sup>13</sup> **Commentary & Citation:** From all that I have seen and read in relation to Carl Sagan, it is fair to say that he had lesser respect for – and some disdain for – the humanities; he certainly considered them inferior to science and empiricism (just like my high school in the 1980s). This is not a personal criticism, but rather, I see it as part of the tussle and tow, to and fro, in the struggle of forces in civilization. There are people equally on the other side in the humanities, but it is more difficult with technology triumphant in the modern world.

- ✓ Although Neil deGrasse Tyson does not share Carl Sagan’s sunny view of the universe, e.g.:
  - “Every account of a higher power that I’ve seen described, of all religions that I’ve seen, include many statements with regard to the benevolence of that power. When I look at the universe and all the ways the universe wants to kill us, I find it hard to reconcile that with statements of beneficence” – Neil deGrasse Tyson, at the University at Buffalo, Q & A session, April 9, 2010, video is available on YouTube as of September 2018.

... he too has made some comments disparaging philosophy majors (e.g., The Nerdest Podcast, March 2014) that stoked an uproar on the ‘other side of the aisle’ in the epistemology ascendancy struggle. From Wikipedia article, “Neil deGrasse Tyson,” December 8, 2018.

- ✓ You think there is not an epistemological ascendancy struggle? Then I am from the English-speaking donkey planet “revolving around Sirius” (J.B. Bury, 1913). Wait... I take that back, because someone might investigate and find out its true!

<sup>14</sup> Commentary: Pharma-bro (aka Martin Shkreli) is a classic example of a compounding or snowballing positional error. He took money that he was not authorized to take, used it to make investments and lost the money. He probably figured that he would win big, pay back the money and no one would notice or all would be well. But he lost. He then raised the price of a critical medication that he controlled to regain his losses. This attracted a media outcry and political attention during the run-up to an election. He also involved himself via social media in the presidential election. But his first and most enduring error, as any respectable Roman senatorial or equestrian would say, was in cultivating an obnoxious, juvenile rich frat boy persona while also being a corporate officer, responsible for other people’s investments. He was arrested in December 2015 and charged with securities fraud and found guilty by a jury in August 2017 of securities fraud and conspiracy for a ‘Ponzi-like’ scheme, his bail was revoked in September 2017 for inflammatory speech not protected by the First Amendment. He claimed that he was being persecuted for his personality and wealth, and baited by the media, however the feds may have already been investigating him previously, but he clearly failed to anticipate the climate and adverse reactions to whatever he did and had to play catch up until it all caught up with him.

- ✓ Although he claimed during sentencing that it was never about the money, clearly something was driving him along (and the fact that it made him a multi-millionaire must have been very satisfying), and if not money, then it must have been about ‘winning’; getting away with something over everyone else, that was everything to him. This aspect seems to appear most often in relation to corporate and finance situations. Our society doesn’t exactly discourage that but does occasionally ticket speeders (e.g., Michael Milken).

<sup>15</sup> Citation & Commentary: “Those far distant, storm-beaten ships, upon which the Grand Army never gazed, stood between it and domination of the world.” – Alfred Thayer Mahan (The Influence of Sea Power Upon the French Revolution and Empire, 1793–1812 (1892)).

- ✓ The stunning British victory over the combined French and Spanish fleets at Trafalgar in 1805 is the classic study of the combination of the war college and superior technology both in naval tactics and in strategic naval power. The British ships, though fewer in number, were faster, more maneuverable, the British naval personnel were better trained, more experienced and determined, the British guns were firing two shots for every one received, they were probably more accurate and aimed at the waterline. In the light breeze of that day, the French and Spanish fleets moved very sluggishly and were taken by surprise by the British tactics of cutting their line in two places. In the end, the French and Spanish had lost half of their ships, the British lost none. Afterward, no nation challenged British naval superiority (even in the War of 1812) for over a century. Defeating the British at sea, or the Americans and British at sea (the comparable American naval victory is the similarly much studied, Battle of Midway), has been the first-order requirement for any nascent global power (or colonial resistance) for the last three centuries of world history.

<sup>16</sup> Commentary: This is an inherent problem with Google searches, their program believes the most current, newest, most popular, viral, is always the most relevant result, and thus bands, albums, songs, television programs, YouTube videos, movies, celebrities and bad people dominate top search results if any word related to them vaguely matches the query. Google is always about the hip, the shallow, and the now, like the society that made it. The problem is not likely fixable and not likely to be fixed anytime soon if it is, because that would change the nature of Google.

<sup>17</sup> Commentary: According to Memory Alpha wiki, the Star Trek universe did have a Dreadnought-class ship, the USS Vengeance in the Kelvin Timeline (ST: Into the Darkness, 2013), which was designed as a pure warship, with minimum crew, and AI heavy. It was designed so that the captain could fight and operate the ship without any crew, using AI, while sitting alone on the bridge. This design reflects the modern sense of AI possibilities but is not the baseline assumption of GGDM, which follows the old well-trodden paths of sci-fi.

- ✓ The complement of the Battlestar Galactica was 2000-2500 (Wikipedia, “Battlestar (reimagining)”) or 2,500 to 3,000 during the show (about 5% of the remaining human population), ranging up to 5,000 during the first Cylon War (Battlestar Galactica Wiki, “Galactica-type battlestar”), and operated understaffed without hindrance during the show.

- ✓ Again, according to Memory Alpha wiki, the USS Enterprise-D (ST:TNG) had a crew of 1,014 including civilians and families, while I recall from ST:OS mention of around 400 crew on the Enterprise and according to Memory Alpha, there were eight crew sleeping in bunks in each quarters (not the luxury apartments of ST:TNG). Memory Alpha wiki article, “Constitution-class,” shows crew numbers between 200+ and 400+ for the original Enterprise and the refit, Enterprise-A. So advance of technology between ST:OS and ST:TNG did not result in reduction of the complement of the successive Enterprises, but rather, they added civilians and family.
- ✓ According to Andromeda wiki, the pre-fall crew complement of the Andromeda Ascendant was 4,500, which included a regiment of Lancers, plus fighter pilots (thus the Andromeda Ascendant was hybrid mission ship, a warship, transport, and carrier). Yet, the ship operated for much of the series, with significant AI assistance, with half a dozen crew and hundreds of androids. The fighters were remotely operated as drones from the bridge by Tyr Anasazi during combat. The ground landing force during the series were a handful of sophisticated, heavily armored, AI operated Planet Defense Bots.

Some questions to be answered in GGDM is what is the relationship between ship building cost and sophisticated AI systems, and if the ship is mostly AI, what support is required from Log Ships (see Logistical Support Ships, 3 Movement, p. 860, *infra*) for the minimum crew?

<sup>18</sup> Commentary & Citation: In the Forever Knight episode, “Last Act” (1992), Erica, a 17<sup>th</sup> Century playwright and tri-centennial vampire, commits suicide at the beginning of the episode by sitting on a park bench to watch the sunrise. She was tired of darkness, and missed seeing the sun.

- ✓ I’ve always wondered how and why all of those vampires ended up in modern Toronto?
- ✓ If a vampire can be killed by exposure to sunlight, is it because 1) the sun has some mystical power that makes it the natural arbiter of what is ‘right and natural’ on Earth (i.e. the image of the old sun gods), or 2) there is something about the vampire’s physical being that makes it susceptible to sunlight, like old thermal printer paper, or 3) simply because they and the population believe it to be so?
- ✓ I later watched Interview with the Vampire (1994) in late 1995 at college; I did not dislike the movie, but I thought it was slow, I remember I was having a difficult time staying awake (I was very tired likely), and I really didn’t care for the anti-climactic silliness of the scene where he finally met the European vampires. I might think differently of the movie now if I re-watched it 25 years later.
- ✓ Oddly, some of the sadness of being a vampire that Roger Ebert commented on in his review of Interview with the Vampire (November 11, 1994), crept into Dr. Who in Series 8 (2014), and people didn’t like it, said the series lost its joy, that Peter Capaldi wasn’t connecting with the audience as the Doctor (e.g., see Neil Midgley quote, X-Factor, 2 The Streams of Time, bottom p. 87, *supra*).

<sup>19</sup> Citation & Commentary: According to Wookieepedia (information captured February 3, 2017), the complement of the original Death Star (DS-1) was about 1.2 million people, including 343K Imperial Army and Navy and 26K Storm Troopers. That is approximately the population of Dallas, TX in 2010. So, Luke’s torpedo in the vent was equal to a couple of nuclear weapons hitting Dallas, TX in 2010 (found on [http://www.citymayors.com/gratis/uscities\\_100.html](http://www.citymayors.com/gratis/uscities_100.html)). Star Wars fans have no problem with this apparently. If the assumption is made that the complement of the Death Star naturally contained the best and brightest of the Empire’s personnel, the loss of the Death Star (to such a simple design flaw) is a particularly staggering blow (similarly, the Roman Republic lost hundreds of galleys, three entire fleets, to storms at sea during the Punic Wars, significantly taxing their resources and manpower). Likely, the unfinished second Death Star (DS-2) at Endor, though larger than the original Death Star, had only a fraction of the crew when it was destroyed, but again, those would have included the remainder of the Empire’s best personnel, officers, technicians. The Romans prevailed, the Palpatine Galactic Empire crumbled.

<sup>20</sup> Commentary: This percentage can be adjusted to suit when the game is set up, in primary school grading, 90% is considered excellent. Adjustment to 15 or 20% will cause greater consumption of committed Faculties. Dynamics.

<sup>21</sup> Commentary: Or as is commonly said in sports, play within yourself, focus on what you can do, what you do best, do your job. The opponents are going to do what they can do. And that’s the contest, the sport.

<sup>22</sup> Citation: Dr. Jesse Bennett performed the first successful Caesarean Section operation in North America on his wife in 1794 in Virginia. Bennett also appears to have later declined to join the Burr Conspiracy against the United States.

*“Any political movement can choose to grow large and lose some of its doctrinal purity, or to remain small and lose some of its electability. ...*

*A society given to a romantic narcissism about its presumed exceptionalism, the United States has not been well served by those who spin myths about its accomplishment and repeatedly deny its faults.”*

– Alan Wolfe, Time.com, September 7, 2016

**Hand-Wringing Aspect:** “Romantic narcissism” is a good example of an Aspect. It has been in our society for a long time – national politicians routinely open and close political speeches with unabashed, glowing praise of the United States and its citizens; President Obama has been criticized for providing a less glowing assessment of our culture. But a particular brand of romantic narcissism was brought to the fore in the U.S. 2016 Presidential Election leading to a considerable and unprecedented level of hand-wringing and critical analysis on this and related issues.

- ✓ “Nevertheless, all these theses, however baseless and disproven, are being boldly put forward again today. What does this indicate? It indicates that Soviet party line is not based on any objective analysis of situation beyond Russia’s borders; that it has, indeed, little to do with conditions outside of Russia; that it arises mainly from basic inner-Russian necessities which existed before recent war and exist today.” – George Kennan, U.S. Ambassador to the Soviet Union, from the Long Telegram, February 22, 1946.

Unfortunately, as the 2016 U.S. Presidential Election demonstrated, this condition is not unique to the (defunct) Soviet Union.

- ✓ See also Sebastien Roblin (2017) quote in Dirty Business, 3 Commerce, p. 1217, *infra*, and Romantic Nationalism discussion, 3 Government Titles, p. 618, *infra*.

*“Let’s be frank with each other, Father. I can’t fight the prince who makes my work possible – no matter what I think of his policies or his politics. I appear to support him, superficially, or at least to overlook him – for the sake of the collegium. If he extends his lands, the collegium may incidentally profit. If the collegium prospers, mankind will profit from our work.”*

– Walter M. Miller, Jr., [A Canticle for Leibowitz](#) (1959)

**Institutionalized:** Institutes are non-technological installations created by use of a Special Writ called a Land Grant. Institutes are “social installations” at or on a specific colony such as temples, amusement parks, prisons, schools (but not Colleges), command centers, financial markets, social services, and such, which are not related to any specific technology, i.e. Patent (see Patents generally, *infra*), and the existence of which probably predate interstellar civilization.

- ✓ A Special Writ is simply a Writ that is named in the GGDM rules and performs a function specified in the rules. Examples include the Land Grant for Institutes, the Writ of Naturalization (see Naturalization, 3 Order, p. 557, *infra*), and Articles of Incorporation (see 1 Corporations, p. 1246, *infra*).

The naming of a University, Academy, Temple, or other “educational” institution as an Institute is not prohibited, *per se*, as such Institutes will be considered more localized, physical installations than the Colleges; and as long as their operation doesn’t significantly or generally *overlap* the function of Colleges in GGDM. And as long as doing so doesn’t cause great confusion.

Perhaps one of the most famous interstellar-level Institutes in science-fiction literature is the hospital space station that is the setting of the long-running (1957-1999) Sector General medical and alien First Contact novels and short stories by space-opera pacifist writer James White. Sector General has been attributed as the inspiration (or at least notably similar) to the two 1990s space station television shows, *Star Trek: Deep Space 9* and *Babylon 5*. Mr. White is now in residency at Sector General Hospital. Other examples of possible Institutes include Rush 2112’s Temple of Syrinx, the vast interstellar cartography facility from Mike Resnick’s book *Birthright: The Book of Man* (1982), and, the University of Trantor and the Foundation on Planet Terminus from Isaac Asimov’s *Foundation* series.

Institutes can be singular; there is no requirement to construct Institutes across several colonies. Universities, like other institutions in a space-opera setting, can morph, take on outsized importance, be something not quite like the term used on Earth, at the judgment of the Concierge.

- ✓ “Institution” in various forms is a widely, generically used term in our civilization and is found in dozens of sections of GGDM used in quotes and commentary – usually without a capital ‘I.’ GGDM College-related non-technological installations – which could be called Land Grant Institutes – are referenced throughout GGDM as Institutes with a capital ‘I’ to differentiate them from the generic use of institution.
- Letters Patent: Land Grant Writs are created and introduced the same way as normal Writs (see *Tabula Rasa*, 1 Writs, p. 436, *supra*). The Land Grant Writ must provide all of the special information necessary for the Institute. Specifically, a Land Grant Writ must include a Power Activation (as a normal Writ), the name of the Institute being created, a specific College with which the Institute is associated, which will be used to supply Faculties, the number of Faculties used per turn per Institute location, and the building cost and operational effect of each Institute (i.e. what does it do with those Faculties?). Institutes may never be used to affect die rolls. Ownership of Institutes is non-transferable, but they might continue operating for awhile or indefinitely, to a greater or lesser degree, after capture.
  - ✓ For example, schools and medical facilities on alien population planets would probably continue as long as the urban centers were not significantly disrupted. To what effect is highly circumstantial and at the judgment of the Concierge.
- Land Grant: Specifically, the ability to build a particular Institute is created by the use of a Land Grant Writ; however, the building of Institutes on or at colonies requires:
  - ✓ The activation of the Writ that created the Institute (by actualization of a designated Fuzzy Group and concurrent activation of the Power listed on the Writ) and,
  - ✓ The simultaneous activation of the Construction Power at any *Friendly or Naturalized Colony* where it is desired to build the Institute (cost counts against the GDP),
  - ✓ One activation of the Land Grant Writ may be used to build Institutes in as many places as legally possible in the same turn with Construction Power activations.

- ✓ Institutes will have a building cost, as any other installation, and only *one* of each type of Institute may exist on each colony at any time (they can be rebuilt as above if destroyed, as by Raids, Orbital Bombardment Black-ops, etc.).

The restriction of building Institutes on Friendly or Naturalized Colonies is based on the idea that the Institute represents the high ‘state of the social art’ in that particular area in the local planetary civilization, is generally in accord with the larger interstellar civilization and is approved and promoted by the interstellar government. This approach then generally omits the building of Institutes on Conquered or Converted **alien colonies**, but like many rules in GGDM, there are some possible gray areas that could develop with regards to Lost Colonist Primal State positions (see 6 Beginnings, p. 63, *supra*), reversions of unguarded Conquered or Converted Colonies (see Conquered Colony and Converted Colony, 2 Order, pp. 539-540, *infra*), Diplomatic Spaces and Shared Meanings (see 2 Diplomacy, p. 1116 and 3 Diplomacy, p. 1131, respectively, *infra*), and possibly MegaCorporations (see 2 Corporations generally, *infra*) and technologies and sundry other possible situations. These situations will be left for the Concierge and participants to work out and judge in-game.

- Meets and Bounds: In order to operate, an Institute must be supplied with Faculties each Regular Turn. An Institute will operate automatically (no Power or Writ activation necessary), and use available Faculties, each Regular Turn that the College to which it is associated has enough Faculties in its “class” *after* pre-committed Faculties are subtracted for use in rerolls (however, see Skool Tyme, 2 Constructural Elements, p. 190, *supra*<sup>1</sup>).
  - ✓ Institutes generally operate at the end of the Regular Turn, before Colleges operate, unless otherwise specified in the Land Grant Writ.
  - ✓ Institutes generally have a strictly local effect, although that is negotiable.

It is through the use of Institutes that Faculties may be applied to general, and *non-die-roll situations* such as Taxation and Census. Institutes cannot produce Faculties for either the position’s use generally, or for its own use or the use of another Institute. Institutes that fail to operate for five consecutive Regular Turns are closed and removed from the colony.

Institutes may not be used to force a reroll in situations where their world fails to obey a Power Activation due to inactive Constructural Elements (see Power Off, 2 Constructural Elements, p. 193, *supra*), but through the use of Faculties, any chance of failure could be affected on the world where the Institute exists, if built for that purpose, which will be defined in the Land Grant Writ. This is an example of the distinction, above.

There is a very slight crack in the door where an Institute might be used to create Faculties for some other local, *non-Institute use*. There are no such uses currently in the GGDM rules, however.

- ✓ “The barbarized inhabitants of the four kingdoms believe that the Foundation’s technicians are magicians. Being unable to make these people understand the difference between magic and science, the technicians finally give up and allow themselves to be worshipped as holy men. Back on Terminus, Hardin accepts the situation, and organizes the Foundation’s technical assistance program as a religion. The technicians are organized into a priesthood, and the Foundation’s ambassador to each kingdom becomes the High Priest, with Hardin himself assuming the role of Chief Primate of

the whole religion. ... the church also recruits priests from among the native populations of those worlds. They travel to a Temple School in Terminus City, where they are taught the operation (though not the theoretical underpinnings) of the Foundation's technology, along with more traditional religious instruction in church dogma, theology and ethics. Any novitiate priest at the Temple School who is bright enough to see through the mystical surface to the scientific principles underneath remains on Terminus to become a research student. The rest return to the Four Kingdoms to form part of the priesthood." – from Wikipedia article, "Church of Science" (about an entity in Isaac Asimov's Foundation (1951)).

*"[Gadalla] Gubara was born in Khartoum in 1920. His father, an impoverished farmer, was part of the extended family of Muhammad Ahmad ibn as Sayyid Abd Allah. Muhammad Ahmad had proclaimed himself Mahdi and led a jihad against Sudan's Turkish-Egyptian rulers and their British deputy, General Charles George Gordon. The rebellion culminated in the battle of Khartoum, with Gordon slain at the steps of his palace. It was at the Gordon Memorial College that Gubara received his education, earning his school fees by working after class."*

– Nadja Kornith, "The Omega Man – Gadalla Gubara and the half-life of Sudanese cinema," Bidoun (bidoun.org), Issue 20, Spring 2010

**College Educated:** Ok, got all that? Feeling educated now? Have you been Enlightened? No? Here is a little abstract of the Colleges scheme in GGDM:

- ✓ College plus endowments produces Faculties (College Tries based on Endowment/Population favoring urbanization and stability). This occurs at the end of the turn so that the position knows how many Faculties they have available on the next Regular Turn.
- ✓ Faculties belong to the "class" of the College that generated them, and also generally to the pool called The Enlightenment.
- ✓ Faculties can be used to cause rerolls of unfavorable rolls both in Regular Turns and Combat Rounds. They must be pre-committed and are generally subtracted from The Enlightenment starting with the oldest college class.
- ✓ Faculties can also be used to support/operate Institutes (non-die-roll) established by Land Grant Writ on Friendly or Naturalized colonies. These faculties are pulled from the specific College to which the Writ relates, as long as the College has Faculties available.
- ✓ Faculties pre-committed to die rolls support are subtracted first. This may affect the operation of Institutes if not enough Faculties remain during the Regular Turn.
- ✓ Unused Faculties in Regular Turns are returned to the pool. Unused Faculties committed to Combat are lost at the end of Combat. Expended Faculties are removed.
- ✓ Half (more or less) of the Faculties not used on the previous turn are lost before new Faculties are generated.

*“He may look dumb but that’s just a disguise...”*

– The Charlie Daniels Band, “Uneasy Rider” (1973)

**Laconic Humor:** “... [the Spartans] conceal their wisdom, and pretend to be blockheads, so that they may seem to be superior only because of their prowess in battle ... This is how you may know that I am speaking the truth and that the Spartans are the best educated in philosophy and speaking: if you talk to any ordinary Spartan, he seems to be stupid, but eventually, like an expert marksman, he shoots in some brief remark that proves you to be only a child.” – Plato, Protagoras (cited in Wikipedia article, “Laconic phrase”<sup>2</sup>).

Page | 491

- ✓ “... [the Spartans] claim not to have any interest in [philosophy] and put on this big show of being morons... because...they want people to think that their superiority rests on fighting battles and being manly... You can tell that what I say is true, and that Spartans are the best educated in philosophy and argument, by this: if one associates with the most inferior Spartan, one at first finds him somewhat inferior in speech; but then at some chance point in the discussion he throws in a remark worthy of noticing, brief and terse, like a skilled marksman, so that the person he’s talking to appears no better than a child.” – alternative translation by A. Beresford and R.E. Allen, *Id.*

‘Out of the mouths of babes’ humor is laconic: Children expose the ignorant pretentiousness of adults with a single childish question or statement of the obvious, e.g., “The Emperor’s New Clothes” (1837) or The Prince and the Pauper (1881). The American commander’s legendary laconic response (“NUTS!”) to German demands for the surrender of forces at the Siege of Bastogne is also very Spartan.

*“Wherever is found what is called a paternal government, there is found state education. It has been found that the best way to insure implicit obedience is to commence tyranny in the nursery.”*

– Benjamin Disraeli, 1<sup>st</sup> Earl of Beaconsfield, Prime Minister of the United Kingdom (1868, 1874)

**Tyranny in the Nursery:** One of the most literal onscreen depictions of Disraeli’s “tyranny in the nursery” is the unforgettable nauseous elementary classroom scene in the 2013 movie Snowpiercer. Though the whole train premise/setting stretches credibility to the breaking point, the movie is well enough done that it holds for two hours of viewing time.

In 1982 the U.S. Supreme Court heard a case captioned *Board of Education v. Pico*, 457 U.S. 853 (1982) about the removal of The Naked Ape (1967) and eight other books from junior and senior high school libraries (“which the [School] Board characterized as ‘anti-American, anti-Christian, anti-Sem[i]tic, and just plain filthy,’” *Id.*) and First Amendment Rights in public schools. Although other books, such as “Kurt Vonnegut’s Slaughterhouse-Five and Langston Hughes’s Best Short Stories by Negro Writers,” (*Id.*) were removed, The Naked Ape clearly was the center of attention in the debate of the time.

- ✓ “The Supreme Court ruled in the students’ favor on First Amendment grounds, holding that the right to read is implied by the First Amendment. The government – in this case, a public school – cannot restrict speech because it does not agree with the

content of that speech. The decisions called libraries places for ‘voluntary inquiry’ and concluded that the school board’s ‘absolute discretion’ over the classroom did not extend to the library for that reason.” – Bill of Rights Institute (billofrights.org) article “Island Trees School District v. Pico (1982)” (authorship unattributed).

Justices Burger, Powell, Rehnquist, and O’Connor dissented.

- ✓ “In his dissenting opinion, Justice Burger said, ‘If the school can set curriculum, select teachers, and determine what books to purchase for the school library, it surely can decide which books to discontinue or remove from the school library.’” *Id.*

Justice Burger’s dissent was simply practicality; it is hard to disagree for example, when schools had encyclopedias sets in the library which needed to be updated every few years. They could choose to discontinue encyclopedia subscriptions due to duplication of material, shelf space, etc.

Justice Rehnquist wrote:

- ✓ “With these differentiated roles of government in mind, it is helpful to assess the role of government as educator as compared with the role of government as sovereign. When it acts as an educator ... the government is engaged in inculcating social values and knowledge in relatively impressionable young people. Obviously, there are innumerable decisions to be made as to what courses should be taught, what books should be purchased, or what teachers should be employed. ... In the very course of administering the many-faceted operations of a school district, the mere decision to purchase some books will necessarily preclude the possibility of purchasing others. ... In each of these instances, however, the book or the exposure to the subject matter may be acquired elsewhere. The managers of the school district are not proscribing it as to the citizenry in general, but are simply determining that it will not be included in the curriculum or school library.” – Justice Rehnquist, dissenting opinion in *Board of Education v. Pico*, 457 U.S. 853 (1982), cited in Wikipedia article, “Island Trees School District v. Pico,” December 16, 2018. (The 33-page opinion is available free online).

Indeed, not only were students able to obtain and read the books elsewhere – I read a lot of books I wasn’t supposed to be reading in high school, which I could obtain from the community library, at home or at book or game stores (like AD&D books) – and soon the students would be adults off to work and college, and out of the control of the School Board in any case. It is unlikely that such a case would reach the Courts now since the *emergence of the internet* (and portable reading devices); I found a poor but readable PDF conversion of The Naked Ape free on the internet with a simple Google search, just as I found a similarly poor but readable copy of Red Storm Rising (1983) on the internet in PDF (in English but with foreign punctuation marks). Imagine pro-Soviets or the Communist Party suing to keep Red Storm Rising out of school libraries...

- ✓ It is literally irrelevant what books are in the school library now, from the view of the creationist argument. Thus, in *Kitzmiller (ut infra)*, the fight moved to the more direct issue of which textbooks would be required.<sup>3</sup>

The internet has always been about being something big and dispersed beyond the control of local and individual sovereign governments, clergy and censors; this applies to Wikipedia as much as Wikileaks and Pirate Bay, Tor, Torrent, Bitcoin, Spamhaus, and Cyberbunker.

- ✓ The 1960s to 1980s strategy of the Christian right, literalist, or fundamentalists of attempting to control what students could read through the power of school boards over

libraries – silencing the opposition with political control while also screaming very loudly – was a losing argument, or more precisely, the strategy a side follows when it knows it has lost the argument already and along with it, most political and moral authority (that is, ‘pounding the table’). It is the timeless strategy of tired despots and radical ideologues.

- ✓ The case of *Kitzmiller v. Dover Area School District*, 400 F. Supp. 2d 707 (M.D. Pa. 2005), thus arose because the School Board took the additional step – lacking control over what students read due to spread of technology and the internet – of trying to make the flagship intelligent design textbook, *Of Pandas and People* (1989) the required textbook for biology classes (and thus, required reading by being testable).
  - See also Dating Man discussion, 5 Beginnings, p. 57, *supra*.

---

*“My perspective on this controversy comes from 33 years of working with New Guineans in their own intact societies. From the very beginning of my work with New Guineans, they impressed me as being on the average more intelligent, more alert, more expressive, and more interested in things and people around them than the average European or American is.*

*At some tasks that one might reasonably suppose to reflect aspects of brain function, such as the ability to form a mental map of unfamiliar surroundings, they appear considerably more adept than Westerners. Of course, New Guineans tend to perform poorly at tasks that Westerners have been trained to perform since childhood and that New Guineans have not. Hence when unschooled New Guineans from remote villages visit towns, they look stupid to Westerners. Conversely, I am constantly aware of how stupid I look to New Guineans when I’m with them in the jungle, displaying my incompetence at simple tasks (such as following a jungle trail or erecting a shelter) at which New Guineans have been trained since childhood and I have not.”*

– Jared Diamond, *Guns, Germs & Steel* (1997), p. 20

---

**The First is Last:** While Colleges are the primary means of generating Faculties, each position will naturally receive some Faculties each turn based on the number of Fundamental Realities taken by the position during set up, due to the natural intelligence and cultural heritage each species brings into the game.<sup>4</sup> Faculties received from Fundamental Realities are called Non-Specific Faculties, or NSF.<sup>5</sup> One Faculty is received at the end of each Regular Turn for each Major Fundamental Reality. The number of NSF received each turn is reduced by one for each College founded during the entire game, regardless of the current state of the College or its eventual fate.

- ✓ The way in which the *Tawantinsuyu* (aka, the Inca Empire) were defeated at Cajamarca by a Spanish force of 168 men is almost incomprehensible to the modern mind (the Inca force outnumbered the Spaniards more than 45 to 1). Just the smallest amount of initiative by the common warriors or low level chieftains massed outside the town, or more thoughtful caution by the *Sapa Inca* leadership group changes the entire result. The *Tawantinsuyu* leadership already knew what the Spaniards had done to the Aztecs, and their allied tribes had already fought the Spanish along the coast. On the other hand, the desperate situation in which the Spanish had placed themselves, and their ambush of the *Tawantinsuyu* leadership was an insane do or die gambit, had their surprise failed, they would have been summarily annihilated by 8,000 native warriors. This was civilizations on the edge.

- **Native Intelligence:** NSF have all of the properties of normal Faculties, including aging, and are most likely to be used early in the game. It is possible also to create Institutes by Land Grant that use NSF by listing NSF as the “College” on the Land Grant Writ. Use of NSF are blocked 25% of the time by inactivation of the Epistemological Constructural Element on the target colony or ship (see Skool Tyme, 2 Constructural Elements, p. 190, *supra*).<sup>6</sup>

This latter should not be confused with the failure of a colony or ship to obey Power Activation due to inactive Constructural Elements. This applies only to the attempt to use a NSF as a Faculty (an intangible object) on the target colony or ship.

*“Talent hits a target no one else can hit;  
Genius hits a target no one else can see.”*

– Arthur Schopenhauer

**Cloaked Genius:** Can genius be *glacial*? If one hits the target no one else can see, no matter how long it takes, is that genius? The problem is that we are *mortal and frenzied*, genius usually is associated with youth, the younger the person, the more likely they will be praised as genius.

If I could have completed GGDM – in its current, final form – 20 years ago, when I was about 30<sup>-ish</sup> that would have been genius. At age 50 plus, having taken an extra 20 years to arrive at the same place, it probably is not (it is mediocracy, even if no one else would have done it). The tortoise takes an extra day to reach the finish line, no one calls him speedy. Unless he invented a rocket pack while doing it.

- ✓ “A genius is a person who displays exceptional intellectual ability, creative productivity, universality in genres or originality, typically to a degree that is associated with the achievement of new advances in a domain of knowledge. Despite the presence of scholars in many subjects throughout history, many geniuses have shown high achievements in only a single kind of activity. There is no scientifically precise definition of genius, and the question of whether the notion itself has any real meaning has long been a subject of debate, although psychologists are converging on a definition that emphasizes creativity and eminent achievement.” – from Wikipedia article, “Genius,” captured January 14, 2019, citing to Catherine Cox, [The Early Mental Traits of 300 Geniuses](#) (1926).
- ✓ “Persons with genius tend to have strong intuitions about their domains, and they build on these insights with tremendous energy. Carl Rogers, a founder of the Humanistic Approach to Psychology, expands on the idea of a genius trusting his or her intuition in a given field...” *Id.*, Wikipedia article.
  - See also pre-theoretical intuition.

Yet, genius is something decided externally by society and circumstance, not internally – we all know the comedy of people who claim they are geniuses; genius is not for you to decide, it is simply for you to do the work to make others decide. Without external comparators, how would you conceive you are a genius? For the same reason, one should also not claim to be a polymath, yet, Nick Bostom, a public intellectual and apparently not the least humble, a man whose education suggests he should know better, makes that very claim on his page, to wit:

- ✓ “Nick Bostrom is Swedish-born philosopher and polymath with a background in theoretical physics, computational neuroscience, logic, and artificial intelligence, as well as philosophy. He is Professor at Oxford University, where he leads the Future of Humanity Institute as its founding director.”

Even if he didn’t write it, he ‘owns’ it now because it’s on his webpage.

Page | 495

- ✓ “In the philosophy of David Hume, the way society perceives genius is similar to the way society perceives the ignorant. Hume states that a person with the characteristics of a genius is looked at as a person disconnected from society, as well as a person who works remotely, at a distance, away from the rest of the world.” – from Wikipedia article, “Genius,” captured January 14, 2019.
- ✓ “In the philosophy of Bertrand Russell, genius entails that an individual possesses unique qualities and talents that make the genius especially valuable to the society in which he or she operates, once given the chance to contribute to society. Russell’s philosophy further maintains, however, that it is possible for such geniuses to be crushed in their youth and lost forever when the environment around them is unsympathetic to their potential maladaptive traits.” *Id.*

The paucity of recognized female geniuses in history is attributable more to the social environment, the constancy of sex-based intellectual suppression in society through 50,000 years than to any lack of genetic intelligence. I have always wondered what sort of ‘ignorant genius’ thought that society was better served by systematically, perpetually suppressing half of the population?

- ✓ For the record: “By the 1937 second revision of the Stanford-Binet test, Terman no longer used the term ‘genius’ as an IQ classification, nor has any subsequent IQ test. In 1939, David Wechsler specifically commented that ‘we are rather hesitant about calling a person a genius on the basis of a single intelligence test score.’” – from Wikipedia article, “Genius,” captured January 14, 2019, citing to Lewis M. Terman and Maude Merrill, Maude, Measuring Intelligence: A Guide to the Administration of the New Revised Stanford-Binet Tests of Intelligence (1937).

Thus, there is no ‘genius’ level IQ although clickbait ads and spam-emails regularly continue to suggest that there is, so you now know it is BS; “Telling someone you’re a genius doesn’t make you a genius, in fact, probably suggests the opposite.” – Chris Cuomo, CNN, August 27, 2019.

- Naked Apes: It is an interesting question to consider why so much genius, ability, and talent develops outside of formal education, academia? The question does not bode well for our education system (and makes selling the restrictive cost of college much more difficult), but it does go some way in explaining how important parts of civilization developed prior to the idea of formalized education. It was a glacial process (e.g., cave paintings), the records show, but one that is ever constant, and remains in case we crash.

The primary value of education I believe is in the guidance of youth in and along the historical paths of thinking to a holistic appreciation; rather than on the Lancastrian sense of factual instruction. GGDM is in fact a testament to this in its entirety. For example, I already had an idea of methodological dualism by the year 2000, and much of the core of GGDM was my struggle to express it and against what I perceived as an epistemological fraud of Western social sciences. This latter finds particular expression in the discussions of Aspects of Sociology, 2 Culture, p. 371, *supra*, and the Looking Rules discussion 2 Expansion generally, *infra*.

My self-education in the latter stages of the GGDM project led to the very late discovery in 2019 of Ludwig von Mises, praxeology, and the Austrian School; this discovery put the label ‘methodological dualism’ on what I had already been arguing in GGDM for over 20 years.<sup>7</sup> However, Austrian School Economics and praxeology are not new, not even within my lifetime of a half century are they new news, rather, with proper instruction, perhaps as an undergrad in my 20s or in graduate courses in my 30s, I would have learned all of this cognitive history (and been able to better express it earlier in the GGDM evolution) rather than discovering it in a backwards process through GGDM self-education. But instruction nowadays is solely in the cognitive history of empiricism, especially with the renewed catechism-like focus on STEM, and praxeology (like rhetorical theory) just doesn’t fit into that steel box.

- ✓ Admittedly, I may be blamed as well for my own ignorance. I suppose that had I more intensely engaged in cognitive history earlier in my life, I might have discovered the Austrian School without formal instruction. We are all ultimately to blame for our own ignorance once we have learned to read and write – whether it be willful ignorance or ignorant ignorance – or as Erasmus said, “Do not be guilty of possessing a library of learned books while lacking learning yourself.” Or if you have internet. This enters into the territory of the ‘teachable moment’ (see discussion, 1 Kairotic Moments, p. 1418, *infra*); perhaps the sabbatical to finish GGDM, the end-processes of bringing GGDM up to the vision of what it could be, was my midlife ‘teachable moment’ that did not occur during the work-grind of my 20-year career in law firms.
- ✓ For most of my life, I never thought of economics as a ‘social science’; economics, as presented in our civilization, always is a math analysis of economic data, followed by policy arguments and (usually gloomy) predictions. It was not until I encountered praxeology that I realized any claim that economics is a social science.

---

*“Quality is not an act, but a habit” – Aristotle*

---

**Arete for All:** Readers may see in GGDM Enlightenment the ancient Greek concept of *Arete*:

- ✓ “Arete ... in its basic sense, means ‘excellence of any kind.’ The term may also mean ‘moral virtue.’ In its earliest appearance in Greek, this notion of excellence was ultimately bound up with the notion of the fulfillment of purpose or function: the act of living up to one’s full potential.

The term from Homeric times onwards is not gender specific. Homer applies the term to both the Greek and Trojan heroes as well as major female figures, such as Penelope, the wife of the Greek hero Odysseus. In the Homeric poems, Arete is frequently associated with bravery, but more often with effectiveness. The person of Arete is of the highest effectiveness; they use all their faculties – strength, bravery, and wit – to achieve real results. In the Homeric world, then, Arete involves all of the abilities and potentialities available to humans.

In some contexts, Arete is explicitly linked with human knowledge, where the expressions ‘virtue is knowledge’ and ‘Arete is knowledge’ are used interchangeably. The highest human potential is knowledge and all other human abilities are derived from this central capacity. If Arete is knowledge and study, the highest human knowledge is knowledge about knowledge itself; in this light, the theoretical study of human

knowledge, which Aristotle called ‘contemplation,’ is the highest human ability and happiness. ...

The meaning of the word changes depending on what it describes since everything has its own peculiar excellence; the *arete* of a man is different from the *arete* of a horse. ... By the 5<sup>th</sup> and 4<sup>th</sup> centuries BC, *arete* as applied to men had developed to include quieter virtues, such as *dikaiosyne* (justice) and *sophrosyne* (self-restraint).” – from Wikipedia article, “Arete,” July 23, 2019 (emphasis in original).

Enlightenment in GGDM perhaps differs in a couple of respects.

- ✓ First, it is focused on excellence in the critical moment of a task rather than overall lifelong excellence, though the two must be related. Further, individual excellence is not required exactly for Enlightenment, frequently it is as much organizational excellence. Nor should excellence be assumed to exist solely in leadership, sometimes the actions of just one person is enough to favorably resolve the situation.
  - In this sense of the ‘critical moment’ and ‘vital place,’ GGDM Enlightenment is somewhat related to Kairotic Moments generally, *infra*.
- ✓ Second, Enlightenment as used in GGDM is devoid of reference to moral virtue except where critical to the moment when it is applied; not all critical moments involve moral virtues, for example, if the critical task of the moment requires excellence in computer code, which it may in GGDM but not in ancient Greece.
- ✓ Finally, Enlightenment roosts on a different level, it is not personal development philosophy that belongs to the few pre-destined, divinely-blessed heroes, to the educated aristocracy (the word ‘aristocracy’ derives from *arete* via *aristos* meaning ‘best’), or even to individuals generally (as we well know), but rather, a civilization trait in the spread of excellence in whatever form necessary, through education (e.g., literacy, critical thinking, knowledge), the information and print revolutions, raising up the bottom of civilization as a whole, leading to those times and places when it is critical.

The expression of all of this in game terms is the classic do-over, reroll mechanic that designers have long used to express *arete* in heroic characters (e.g., RPGs, card games) or special abilities of positions in the game; there is nothing original in this in GGDM. All of this is, perhaps arguably, more in the sense of modern sports moments, movie heroes, and making hit singles in popular music than in the ancient sense, but it is also accessible to game participants in that way.

- Heroes are Some: The word ‘hero’ is a bit overused now, and as such, has had an increasingly muddled meaning: The ‘hero of the game’ in a sporting event is not in the same class as a firefighter who rescues people from a burning house. But they are sort of related.

There are two senses in which ‘hero’ is used in the current society and meaning runs the continuum from *arete* to selfless sacrifice. I believe the original meaning of hero was that of *arete*, which not only meant individual excellence, but more so, effectiveness. Excellence is measured by effectiveness. Add circumstance and timing (*kairos*) and you have the hero; the one who is excellent, effective, at the critical moment.

This may or may not imply personal risk, selflessness, courage, or sacrifice. But somewhere, I think it likely in the 19<sup>th</sup> Century, the literary idea crept in that heroism meant death, that is, to be a hero, one had to die in the act (at least suffer significantly); this may have been a result of the Napoleonic Wars. The idea was still strong when I was young, possibly due to

WWII, Korea, and Vietnam, but has faded somewhat. Military leaders hate this idea; George Patton famously said, “No bastard ever won a war by dying for his country. He won it by making the other poor dumb bastard die for his country” (1944).<sup>8</sup> This anti-self-sacrifice sentiment is also reflected in the 1974 hit, “Billy Don’t Be a Hero,” by Paper Lace.

The latter qualities developed with the introduction of Christianity to the West. To make Jesus Christ a hero, they added self-sacrifice. His excellence then as a heretic wilderness preacher and his timing during the Roman occupation of Palestine wasn’t quite enough to become transcendent. His divinity required self-sacrifice for all humanity and thus the continuum of heroism extended to selfless risk – such as rescuing a wounded buddy in small arms combat or catching an autistic child falling from a third-floor window – to selfless sacrifice of one’s life, health or wellbeing to ‘win’ – such as Swiss national hero, Arnold von Winkelried or the hundreds of people who secretly helped Jews escape Nazi-occupied territories.

- Mediocrity for Most: Mediocrity is failure. Avoiding the possible, probable bad result is not greatness, it is merely bland competence, mediocrity. “Late Bloomer” is just a euphemism for LOSER (epic life failure); for not being fast enough, smart enough or good enough when it mattered (see related term, *opsimath*). When not making excuses, casting blame or retreating into our favorite escape from reality, when looking at our lives unblinkingly, most of humanity – myself included – must admit that they have failed to achieve or become what they should have or might have been, that we have settled for mediocrity. These moments of conscious understanding, without distraction or recreational substances – rare for some people – drive a considerable sum of human behaviors.
  - ✓ What does this have to do with GGDM? First it suggests that the vast majority of population factors, the innumerable numbers of sophont subjects, accept mediocrity in their daily lives. Second, failure to use Enlightenment in any endeavor in GGDM is a concession to mediocrity in that task, it is acceptance of ‘average’ results in relation to die rolls in the sense of the Law of Large Numbers.

The glowing moment of walking across the stage at graduation, the praise from friends, co-workers, employers for whatever reason, the things we pride ourselves on, having a job, career, house, car, staying out of jail and trouble, doing the things that we are expected to do – are just banal and temporal motions. They are so ultimately unsatisfying, we must look elsewhere for a framework of meaning, a construction where we are a hair more than a nobody. In my framework, this is true and it doesn’t matter to me if anyone likes it or not.

- Warming a Seat: Just because you graduated high school doesn’t mean you aren’t a high school ‘dropout.’ I went to a large high school; more than half the kids who graduated with me had mentally checked out sometime between 7<sup>th</sup> and 9<sup>th</sup> grades. I knew kids in 8<sup>th</sup> grade – my neighbors – who stopped in the alley next to the school and popped a pill before entering the school building. Most of the rest who weren’t actually on drugs, were just there warming a seat, coming to school to socialize, or so they could play football or basketball, being passed along, waiting for graduation. And ten years later, probably a lot of those kids have children who are in grade school; and the parents can’t or won’t help their children with their homework. I would not be able to help a child with algebra homework past the intro level; I got lost in Algebra I, but each year, they gave me a passing grade so that I could take Algebra II, III, and Geometry/Trig in 10<sup>th</sup>, 11<sup>th</sup>, and 12<sup>th</sup> grades. I was just warming a seat in math and being passed along to graduation.<sup>9</sup>

*“Acting is a really simple job – it’s just hard to do. You just have to be that person with their background in that situation. That’s all it is. My kids do it all the time when they’re dressing up and playing games.” – Jason Isaacs*

**Another Silly Space Game:** In my youthful glow of the early 1990s, I once asked a sociology professor what reception or effect Alvin Toffler’s Future Shock (1970, which I read on my own in high school in the early 80s) had on the social sciences? The professor, with only slight hesitation, said, “Not much really” – very likely, if he did not immediately recognize the author or the name of the book, it was an easy (and casually unimportant) question to answer. I expect the same conversation might be repeated twenty years hence, perhaps in relation to some terminology that filters into the social science lexicon from GGDM. Like Toffler’s futurology, GGDM speaks its own ‘language,’ hopefully the language of the fourth order of natural phenomenon.

Page | 499

Looking back, I would guess that sociologist would not have considered Toffler’s work as a ‘futurologist’ to have anything useful for sociology – speculations on the future are for science-fiction writers and crackpots – just as a space-opera game about interstellar civilizations, written by a nobody (*ne hemō*), no matter how meticulously crafted – will never be anything more than a silly space game with laughable pretensions of redeeming intellectual or academic value.

- ✓ I have no reason to think that GGDM will be appreciated holistically and every reason to think that it will not: Everyone who cares enough to comment will be too busy criticizing this or that part, taking it apart, or the overall tone, or the length of it, or the arrangement and presentation. Reduce and divide, criticize, the way it has always been.<sup>10</sup> And despite knowing it, despite it being long observed, we seem to be unable to change it – just as we have long known we need to breathe air but cannot change it – making this trait of humanity definitionally a Fundamental Reality.
- ✓ See continued diss discussion in SILLY SPACE GAME FALLACY, 2 Fallen to Earth, p. 1519, and FALLACY OF PRETENTIOUSNESS, 3 Fallen to Earth, p. 1546.

*“The secret message communicated to most young people today by the society around them is that they are not needed, that the society will run itself quite nicely until they – at some distant point in the future – will take over the reins.*

*Yet the fact is that the society is not running itself nicely... because the rest of us need all the energy, brains, imagination and talent that young people can bring to bear down on our difficulties. For society to attempt to solve its desperate problems without the full participation of even very young people is imbecile.”*

– Alvin Toffler, Learning for Tomorrow: The Role of the Future in Education (1974)<sup>11</sup>

#### Endnotes.

<sup>1</sup> Citation: “Any object – ship or colony planet – that does not have an active Epistemological Constructural Element may not (50% chance) be able receive the effects of College Faculties (whether for use in die rolls, including Combat, or Institutes on that colony).” See Skool Tyme, 2 Constructural Elements, p. 190, *supra*.

<sup>2</sup> Commentary: Probably the most famous attempt at making a laconic extraterrestrial was Mr. Spock in Star Trek OS; the Vulcans were initially presented as being somewhat Spartan in nature – befitting the original vision and

budget of Star Trek. This has not held up over time; Mr. Spock wasn't exactly laconic even then (as aspiring actors need important lines for their character) and over time, in keeping with our own cultural development, the Vulcans, Earthers and the rest of Star Trek became big, flashy and materialistic. And talky. A laconic wit needs a big talker to work as a foil, and that "loud-mouth tin-plated dictator" Captain Kirk (along with most Klingons) was excellent for the job of being a foil.

- ✓ Ironic humor has taken over civilization and our mindset in the last century – e.g., when I make a mistake playing Freecell, I say to myself, 'yeah right, brilliant!' when I obviously mean the opposite but it would be interesting to see development of an laconic advanced alien civilization in film or television (or GGDM).

<sup>3</sup> Citation: "If God hadn't written [the Bible], we would be trying to keep it out of public libraries, not in the public schools." – Betty Bowers (Deven Green), "Save the Hole in Front for Marriage," YouTube, September 6, 2010.

<sup>4</sup> Commentary: Conversely, consider the many historical instances where a small native band, under the leadership of a brilliant, clever indigenous warrior or chief, have confounded colonial forces or their former masters (if enslaved) who hold superiority in education, numbers and all material aspects.

<sup>5</sup> Commentary: It's no accident that NSF also happens to be the abbreviation for "Non-Sufficient Funds," i.e. a bounced check at the College Registrar's Office.

<sup>6</sup> Commentary: There are two oft-repeated sayings that when put together, describe human enlightenment on the individual level: "know thyself" ... and ... "familiarity breeds contempt." Think about that for a moment.

<sup>7</sup> Commentary: I actually rediscovered Clarence Marsh Case through his 1924 book that I had rescued from a garbage pile in the rain back in or around 1990 or 1991, and incorporated his arguments into GGDM several months before I discovered praxeology and shortly I determined that Mr. Case was influenced by praxeology of his day.

<sup>8</sup> Commentary: There is some dispute about the authenticity of this quote. Many refer to it as a misattributed quote, the problem being the "Patton speech" delivered by George C. Scott in the film Patton (1970). On the other hand, it is claimed that this was said by Patton when opening a speech to the 6<sup>th</sup> Armored Division on May 31, 1944.

Still, the line is consistent with his legendary gruff character and with other quotes attributed to him, such as:

- ✓ "All of the real heroes are not storybook combat fighters, either. Every single man in this Army plays a vital role. Don't ever let up. Don't ever think that your job is unimportant. Every man has a job to do and he must do it. Every man is a vital link in the great chain."

<sup>9</sup> Commentary: *Conversely*, there was a cantankerous old high school science teacher with a Ph.D. in physics who was assigned to teach two classes of Algebra I in my 11<sup>th</sup> grade year; I was not in those classes. He caused a scandal by failing 90% of the students, literally, giving them a F for the course. Parents were outraged. As an adult, I can see the probable outlines of the arguments. He might have said, 'Well, they didn't learn the material, so why should they be given a passing grade? What good does that do?' (*ahem*) While on the other side, the argument might have been, 'But you had them for an entire school year. If 90% of your students didn't learn what you were supposed to teach...?' (*cough*) After an investigation, the school supervisors overrode him and changed the grades to passing.

<sup>10</sup> Citation: "Fantasy is a natural human activity. It certainly does not destroy or even insult Reason; and it does not either blunt the appetite for, nor obscure the perception of, scientific verity. On the contrary. The keener and the clearer is the reason, the better fantasy will it make. ... For creative Fantasy is founded upon the hard recognition that things are so in the world as it appears under the sun; on a recognition of fact, but not a slavery to it. So upon logic was founded the nonsense that displays itself in the tales and rhymes of Lewis Carroll. If men really could not distinguish between frogs and men, fairy-stories about frog-kings would not have arisen." – J.R.R. Tolkien, "On Fairy Tales," (lecture-essay, 1939), included in Tales from the Perilous Realm (2008).

<sup>11</sup> Commentary: This is by far the best known and most oft repeated quote from Alvin Toffler, who has otherwise been mostly forgotten. A Google search turns up this quote in ministry speeches, luncheon speaker remarks, mission statements of various organizations, and of course, two dozen quotes collection pages. It always sounds good as an opening or launch point for speakers who want to seem proactive, engaged and progressive in education. But – despite all the speeches and mission statements – it is not much less true now than it was in 1974.

- ✓ The message of my youth was clear; you're a weirdo, you are interested in stupid, boring things, go away. And blank looks from adults. GGDM continues that fine tradition. It was cool to be stupid, a druggie, a jerk, a jock, and uncool to be smart, intellectual, interested in things, educated, caring, ambitious. Not much has changed.

*“I have neither the time nor the inclination to differentiate between the incompetent and the merely unfortunate.”*

– General Curtis LeMay, commander of SAC, 1948-1957

*“The strikes are not intentionally indiscriminate but rather result from a lack of ... experience with dropping munitions and firing missiles,’ the specialist said, according to a [State] Department account of the meeting. ‘The lack of ... experience is compounded by the asymmetric situation on the ground where enemy militants are not wearing uniforms and are mixed with civilian populations,’ he said. ‘Weak intelligence likely further compounds the problem.’”*

– Warren Strobel and Jonathan Landay, Reuters News Service, October 10, 2016 <sup>1</sup>

**The Four M’s:** Every soldier comes to the battlefield armed with all of the tools of his civilization, material, mental, morale, and moral. Combat is the most intensive test of a civilization. Sometimes GGDM proceeds from axiomatic statements; however, consider the following:

- ✓ “Fliers bring the stress of their lives onto the plane. They are working too hard or not enough. They are worried about money, politics, health care, or their family. The outside world is a factor, experts say. It’s baggage they can’t check.” – John Ostrower, “The new age of airline rage: Why everyone onboard is on edge,” CNN Money, May 8, 2017.

Just as you come to GGDM armed with a lifetime education, cultural and political indoctrination, shared impressions and memories of your generation, opinions and morals imparted upon you by your parents and biases, prejudices and judgments. You come clothed in existential realities.

- ✓ “It would be an injustice, nevertheless, to accuse these middle-aged staff officers of mere callousness. Almost without exception they were men of rigid honor who had dedicated their lives to duty. Unfortunately, they were also narrow men, uneducated in economics, history and the social sciences, uneducated even in the broader lessons taught by war. Their schooling, received in such academies as St. Cyr, Sandhurst and West Point, had given them an excellent technical foundation for the command of professional armies. But neither in training nor tradition were the military monks of 1914 fitted for leadership in a modern armed nation.” – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 729.<sup>2</sup>

This is a really interesting comment by Mr. Montross in light of the Aspects of Sociology discussion in 2 Culture, p. 371, *supra*, because Clarence Marsh Case, whose book was published ten years after the beginning of WWI, indicates that even in the early 1920s, sociology (or even social studies) were not accepted as sciences. Considering that the leaders of WWI were educated in the late 19<sup>th</sup> Century, it is not surprising that colleges and military academies did not educate them in an area that was not considered science or scientific in any way. Economics was barely a science then, and by Mr. Case’s account, even the “mental sciences” (e.g., psychology, etc.) were not widely recognized as science proper at the time WWI leaders were cadets. Mr. Montross’ statement *also shows* that the view had changed significantly by the time of his writing in the post-WWII years.<sup>3</sup>

- ✓ Rhetorical Question: Was Imperial or NAZI Germany or Imperial Japan (or even the Confederate States of America) morally, politically, culturally or socially wrong *because they lost*? How about the British Empire? How about the Zulus? Romans? Christianity has tried to link the fall of the Romans to moral depravity.
- Dregs to War: Do not assume that those being sent to war are the ‘dregs of society’ or the criminal or most expendable parts. That may have been somewhat true in the past (e.g., the noted centuries of declining quality of the Roman Legions due to lower quality recruits, civil war, and shift in virtues) but has become less viable in modern war. The stakes are too high to send less than the best available.

The controversial modern case study on this issue are the decisions of Secretary of Defense Robert McNamara to lower military recruiting and acceptance standards, resulting in a wave of recruits and servicemen dubbed, “McNamara’s morons” (see e.g., Hamilton Gregory’s book McNamara’s Folly: The Use of Low-IQ Troops in the Vietnam War (2015)). Though I went to training in the mid-1980s, I met more than a few that made that impression; in artillery school, one Marine was given a large painted rock to carry around as his ID card, another was handed a shovel and told to go dig his own grave, which he spent a long cold November afternoon doing (what he did was so dumb, inattentive, and dangerous he was ejected from the firing line). And then I was sent to Okinawa...1986; duty station Okinawa Japan is a place that brings out the stupidity in bored and listless young men fresh from high school and boot camp (really, most first enlistment military are high school kids with guns).<sup>4</sup>

- ✓ “The nation that will insist on drawing a broad line of demarcation between the fighting man and the thinking man is liable to have its fighting done by fools and its thinking done by cowards.” – Lt. Gen. Sir William Francis Butler, Charles George Gordon (biography) (1889), p. 85.
- Nationalist Armies: We live in a Western milieu where the major militaries are *nationalist*, regularly trained, supplied and paid citizen volunteer (or conscripted) forces backed by stable governments and industries. There is simply no question in the mind of any U.S. service person that they will be paid, equipped, fed, housed, trained and cared for; it is a major recruiting attraction, an escape and a new chance for young people (it was my escape hatch).
  - ✓ “Another woman, Agnes Sorel, had a leading part in bringing it about. First of the royal mistresses who have molded French history, she helped to urge upon Charles [VII of France, reigned 1422-1461] the necessity for a military establishment capable of keeping his own house in order. As a result the first standing army of the Middle Ages came into being – 9,000 permanent troops, paid and equipped by the king, which could be used to crush the king’s foes either within or without the realm. The raising of this small force, which set a precedent for other monarchs, is one of the landmarks of military history. The feudal age might perhaps have struck a compromise with gunpowder, but the impact of the standing army dealt a death blow.” – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960) p. 186.

The existence of a Combat College *may assume* these conditions exist in GGDM, but that is up to the participants, there is much space-opera fiction out there based on mercenaries. And national armies have not frequently been the case in other times; much of world history has been shaped and governed by the actions of unpaid, undisciplined, underequipped, ill-trained, and ill-supplied military forces. Or militia forces that became mercenary bands.

- ✓ See for example, the 1527 Sack of Rome by Habsburg mercenaries, discussed in Unintended Consequences, 2 Entropy, p. 236, *supra*.

Corruption can be rampant, officers dishonest and incompetent, the loyalty of the troops questionable or uncertain (Concierge Interventions!). Sometimes troops have fled the battle before first contact. In other incidents, e.g., Iraqi Army in 2014, non-existent soldiers were on the payroll, and vital equipment regularly disappeared to be sold on the black market.

[The Abh patrol ship Gosroth is being attacked in Planespace by ten smaller human Assault Ships]

21:13 **Captain:** *A textbook attack formation.*

21:32 **Bridge Officer:** *Captain, the enemy space-time clusters have completely surrounded us. The enemy is really practiced. Their advance is a textbook case. Captain: However, we are just as well trained. Me and my precious crew. Ok, here we go, the moment we've waited for. Commence battle!*

– from Crest of the Stars anime (1999), “Battle of the Gosroth” (Episode 5)

**Textbook Attack:** The Battle of the Gosroth is told from the perspective of the Abh crew on the Gosroth. The Gosroth destroyed seven attacking human ships in close range space-time bubble combat, before being overwhelmed. Both sides executed formations, weapons and tactics nearly perfectly in the battle, it was a matter of small percentages.

- ✓ Strategically, the human command sacrificed a squadron of ships to eliminate a patrol ship to prevent their activities from being discovered.

**Combat Formations:** A Doctrinal Template (or SOP, “standard operating procedure” if you prefer, though the two are not close to the same in military speak) is a document created by positions, which describe in sufficient game detail some wetware combat-related trait, training, or tactical innovation of their forces that is *not solely* the result of either technology or the capabilities of the hardware used in battle. Most often, Doctrinal Templates will describe combat formations, training, organizational, command, and morale related issues.

- ✓ For example, the 18<sup>th</sup> Century Prussians drilled their troops to fire five volleys of musket per minute, the English developed the “thin red line” during the Napoleonic Wars, ancient Greek phalanxes used eight rows instead of the traditional sixteen rows, German U-Boats in WWII used “wolf pack” formations, during the Vietnam War, American pilots developed the “wild weasel” tactic to bait SAMs into firing and giving away their positions, the Romans developed the famous legion from tiny phalanxes, the Germans developed Blitzkrieg in the 1930s, Gustavus Adolphus had the Swedish Brigade Order, modern naval fleets use a 30 km circular formation, the Japanese became the early 20<sup>th</sup> Century experts at jungle warfare, the U.S. Marines became amphibious landing experts.
- ✓ “Also, events exposed a severe lack of procedures for emergency staunching of bleeding. The original Japanese doctrine explicitly forbade first aid to fellow soldiers without prior orders from an officer, and first-aid training was lacking. As result, a large proportion of Japanese dead was due to hemorrhaging from untreated wounds. Furthermore, up to 30% of the total casualties were due to dysentery.... To reduce

susceptibility to diseases, future Japanese divisions would commonly include specialized Epidemic Prevention and Water Purification Departments. Finally, the Japanese food rations were found to be unsatisfactory, both in packing and in nutritional value.” – from Wikipedia article, “Battle of Khalkhin Gol,” captured May 18, 2020.

And who can forget the Adama Maneuver in Battlestar Galactica? Or the Cochrane Deceleration Maneuver in Star Trek? Whether these are possible in GGDM generally depends entirely upon the participants of the game, and specifically on the properties of the Stardrives used and other factors such as colleges, doctrinal templates, and opportunities.

Doctrinal Templates are subject to approval and interpretive rulings by the Concierge.

- ✓ “Doctrinal Template” as used in GGDM is an extreme stretch of the term and is certainly not what battlefield intelligence means by that term. I simply grabbed it for a catchy game term; I know the difference.
- **Brain Trust:** Doctrinal Templates may be created by an activation of the Culture Power for that purpose using one Act, on the same Regular Turn as an activation of the Combat Power. Activation of the Culture Power to Develop Doctrinal Templates is not subject to Power Activation failure checks (i.e. it cannot fail).
  - ✓ Doctrinal Templates may only be created by positions that have a Combat College and may only use Faculties from the Combat College.
  - ✓ Doctrinal Templates may be activated in any suitable combat by use of Faculties from the Combat College.<sup>5</sup>
  - ✓ These Faculties from the Combat College would be used in addition to any that may have been taken from the Combat College for use as die roll support in that combat.
    - It is likely that in many, if not most, positions, the Combat College will be the oldest (or nearly so) College, from which Enlightenment (i.e. Faculties) will be subtracted first. See Nightlight, 2 Colleges, p. 477, *supra*. Doctrinal Templates and Institutes related to the Combat College will additionally strain the Faculties.
    - The Austrian army was not great in modern times – in fact, they were the punching bag for every would-be conqueror (Napoleon, Frederick the Great, Mustafa Pasha, Gustavus Adolphus) from the Thirty Years War onward. But somehow, the dynasty, the empire, always survived.
  - ✓ Doctrinal Templates are not Interpretations or Institutes (i.e. they are not Writs), and do not require the actualization of a Fuzzy Group, and cannot be used to satisfy the Interpretation requirement of any Power Activation.
- **Intuition:** A Doctrinal Template is not required to do anything described in the Combat and Carriers & Fighters rules sections. Fighters and Ship Missiles are Existential Patents (i.e. technologies) and would never be created by a Doctrinal Template.
  - ✓ For example, Combat Screening is a formation, the only one specifically described in these rules, but is a natural and necessary extension of the introduction of Carriers (which is how I thought of the Combat Screening concept) and Log Ships into Combat, and thus does not require the use of a Doctrinal Template.

However, Doctrinal Templates may be developed that are based on, improve, extend or add to either of the foregoing. Much depends on assumptions of what already exists.

- ✓ “A British admiral once said, ‘It takes three years to build a ship, but 300 years to build a tradition.’” – Geoffrey Regan, The Guinness Book of Decisive Battles – The Battle of Tsushima 1905 (1992).

*“Quantum physics defies our physical intuition about how the world is supposed to work. In the quantum world, objects resist such classical banalities as ‘position’ and ‘speed,’ particles are waves and waves are particles, and the act of observing seems to change the system being observed. But what if we could develop a ‘quantum intuition’ that would make this all seem as natural as an apple falling from a tree?”*

*Physical intuition starts developing early, long before we ever encounter Newton’s laws on a blackboard. ‘Babies have a few skeletal principles that are built in to the brain and help them reason about and predict how objects should act and interact in the world,’ says Kristy vanMarle, an infant cognition researcher at the University of Missouri. They understand, for instance, that objects can’t pass through each other, a notion that’s at odds with a quantum effect called tunneling, which allows objects to slip through barriers that, in the classic world, would be impenetrable....*

*Babies also intuitively grasp that objects exist even when you’re not looking at them, a concept called ‘object permanence’ that goes against the classic Copenhagen interpretation of quantum mechanics, in which an object can’t be said to have any definite properties until the moment at which it is observed. Since Jean Piaget first pegged object permanence as a milestone in infant development, psychology researchers have found evidence that ever-younger babies have some sense of it; affirming object permanence seems to be the main theme of peek-a-boo.*

*These innate notions, plus ‘elaborations’ born from watching and interacting with the world, add up to a sort of ‘naïve physics’ that we all grasp without any formal physics training, says vanMarle. But what about building quantum intuition after that early mental groundwork has already been laid? Most students don’t begin studying quantum physics until college, when they already have both an intuitive and a formal, or mathematical, toolkit for classical physics.”*

– Kate Becker, “Is Quantum Intuition Possible?” NOVA, July 28, 2014 <sup>6</sup>

**You Already Knew It:** Human intuition is one of the most difficult phenomenon to explain; it can seem magical, like quantum tunneling.

This is at the core of televised professional team sports, the professional players (in addition to all of their other attributes) have a level of intuition for the game – their processing speed is such that the game moves in slow motion for them – that allows them to do the amazing, over and over again. *Like an emergence.* The success of a televised professional team sport is entirely linked to the opportunity in that sport for intuitive, emergent play by teams and especially, individual star players who experience the sport at a different frame rate. But intuition is not limited to televised sports, it is available in any endeavor in which learning, knowledge, experience, and understanding contribute to a favorable outcome.

- ✓ Intuition is strongly related to illustrativeness; it is the level at which we internally illustrate concepts. Thus, in discussing quantum intuition vs. classical intuition, Ms.

Becker is revisiting a concept in physics that was disparaged as unnecessary in the Bad-Nauheim Debate in 1920 (see 2 Temporal Technology, EN 9, p. 827, *infra*).

Empirical types will cringe at the comparison of magic and quantum anything. But what else is to be said when a particle (alpha particle radiation) that does not have the potential energy to escape the well, is suddenly on the other side of the boundary? Quantum tunneling.

Page | 506

- ✓ “For radioactivity to be understood, the development of quantum mechanics was required. But it should be noted that the birth of quantum mechanics was not initiated by the study of radioactivity but by Max Planck’s study of radiation from a black body in 1900. It was an old field that was not the object of the same interest and publicity as the new spectacular discoveries. It was not until 1928, more than a quarter of a century later, that the type of radioactivity that is called alpha-decay obtained its theoretical explanation. It is an example of the tunnel effect in quantum mechanics.” – Nanny Fröman, “Marie and Pierre Curie and the discovery of polonium and radium,” nobelprize.org, captured October 31, 2018.

In this, Ms. Fröman appears to compare the – let us call it an *emergence* – of quantum mechanics from a different source, and the quarter century delay to quantum tunneling in human sense. A sort of ‘burrowing under’ of an event or discovery, unnoticed, unremarked, to appear later in a different guise or unexpected effect.

Something of this sort is reflected in the movie *Interstellar* (2014) when the computer says (objectively) it is impossible to match the spin rate of the spaceship and Cooper says, “No, it is necessary.” They then dock with the spinning ship indicating that in a moment, Cooper has transcended the impossible. Because the computer cannot be wrong. Right?

- ✓ “‘Our minds evolved to find food and to avoid being eaten,’ says [Daniel] Styer. ‘The fact that our minds ‘overevolved’ and allow us also to find beauty in sunsets and mountains, waterfalls and people; allow us to laugh and to love and to learn; allow us to explore unknown continents, and outer space, and (most bizarre of all) the atomic world, is a gift that we neither deserve nor (in many cases) appreciate. That we can make any progress at all in understanding quantum mechanics is surprising. We must not berate ourselves because our progress is imperfect. Instead, we must continue poking around, in joy and in wonder and sometimes in pain, exploring and building intuition concerning this strange and beautiful atomic world.’” – Daniel Styer (Oberlin College) as quoted by Kate Becker, “Is Quantum Intuition Possible?” NOVA, July 28, 2014.
- Improbables: Sometimes, I just tear through a Mahjongg game, somehow making all the right choices and guesses that I frequently cannot logically explain. Arguably, Mahjongg requires an improbable series of 72 consecutive correct guesses; however, if a player has the skill to remember which tile pairs have already been played off, the number of correct guesses is reduced greatly by knowing with certainty that the second tile pair is an elimination of that tile from the board.
  - ✓ ‘Guesses’ naturally imply that you are operating with imperfect information. That does not mean one is operating with no information, e.g., many partial tiles can be seen under the top tiles, but not all tiles are partially exposed. Further, like terrain,

there are places where one tile can ‘hold up’ the entire game and it would be impossible to have seen it initially.

The number of guesses is also reduced to zero at the point when there are no covered tiles remaining, but that doesn’t guarantee victory (there can be bad formations in a single layer). Sometimes, I don’t remember or am not sure if I had previously played a tile pair off, and in any case, that still leaves a lot of consecutive correct guesses required to resolve the board.

- ✓ In the middle of the third period of the Pittsburgh Penguins vs. the Anaheim Ducks on October 10, 2019, the puck was shot toward the Penguins goal and went down the inside of the back of goaltender Matt Murry’s jersey. You could watch a thousand NHL games and never see that again. But that it happened once it is no longer just theoretically possible. Just extremely improbable, like winning the Big Lottery.
- ✓ I have solved hundreds of Mahjongg games.

Mahjongg is also such that one can make an apparent mistake that turns out to be harmless (like in baseball) or is actually the correct choice, and one can never know until the end, when the board is resolved or not, whether any particular move is a fatal mistake. In these circumstances then, the human player, through experience, develops a general set of operational rules (which make success more probable) to assist in making choices of which tiles to play, for example, when presented with three tiles and needing to play off a pair of them, the strategic value of the tiles (vertically and horizontally) may determine which get played off. Sometimes, all three tiles are of equal weight and it’s just a guess as to which pair you take. In the end, it’s still a judgment call.

---

**Earth President Susanna Luchenko:** *Well, Captain, you caused quite a stir. Half of EarthForce wants to give you a kiss on the cheek and the Medal of Honor. The other half wants you taken out and shot. As a politician you learn how to compromise. Which by all right means I should give you the Medal of Honor, then have you shot. I confess the idea had a certain appeal when I mentioned it to the Joint Chiefs two hours ago. [...] The bitch of it is that you probably did the right thing. But you did it in the wrong way, in the inconvenient way. Now you have to pay the penalty for that. I know it stinks, but that’s the way it is. – Babylon 5, “Rising Star” (1997)*

---

**Interdisciplinary Approach:** From the mid-19<sup>th</sup> Century, after the passing of the generation that defeated Napoleon, into the early 20<sup>th</sup> Century, most of Europe – excepting Prussia who was able to exert their military will on all of their neighbors to form modern Germany – experienced a distinct decline in military leadership.<sup>7</sup>

Events such as the disastrous operations of the Crimean War, the Elphinstone Massacre on the road to Kabul, the war against the Mad Mullah in Sudan to the defeat at Isandlwana to the nightmare of World War I, demonstrate overreliance on technological superiority and descent into military mysticism, in place of military leadership, to support European imperialist ambitions until the whole mess imploded in August 1914.

- ✓ “Waterloo, by cutting short the demolition of European thrones by the sword, had no other effect than to cause the revolutionary work to be continued in another direction. The slashers have finished; it was the turn of the thinkers. The century that Waterloo

was intended to arrest has pursued its march. That sinister victory was vanquished by liberty.” – Victor Hugo, *Les Misérables* (1862).

The apparent reason or cause of this was a fear by civil governments of all types, of another situation such as had occurred with the French Revolution and Napoleon – thereafter, any young military officer who showed ability and ambition and any measure of popularity or political connections, would be subtly or openly pushed out or shunted off to the sidetrack; military ambition and ability were clearly considered threats to civil government. Top commanders were safe choices – members of the nobility or established aristocracy, often old and nearly senile, or young and vain with little military ability; etiquette and propriety, gentlemanly pursuits, and above all, blind loyalty to the crown, were preferred assets for top commanders.<sup>8</sup>

The major European war of the mid-19<sup>th</sup> Century, the Crimean War (1853-1856), is considered to be the bookend of the later disaster that was August 1914. The Crimean War is noted for very poor leadership and planning, disregard for the lives and welfare of troops, and is best remembered for the famed and misdirected Charge of the Light Brigade at Balaclava (1854) – as an epitome of poor military leadership, and for the nurse *par excellence*, Florence Nightingale, a pioneer founder of modern nursing, hospital sanitation and statistics, social reformer.<sup>9</sup>

Battles even became in the mid-19<sup>th</sup> Century, a civilian spectator event, an afternoon picnic, such as at the First Battle of Bull Run (or Manassas) or during the several battles and the Siege of Sevastopol during the Crimean War – a grotesque, macabre affront to our modern sensibilities.

Conversely, popular revolution plus military genius might result in another continental generational war, and there was always fear of another European uprising. But technological and logistical superiority without leadership is just as dangerous as that which the civilian governments feared from a robust military college.

- ✓ In 1785, Napoleon Bonaparte, a 15-year-old 2<sup>nd</sup> Lt. from the Paris Academy, applied and was considered for a position in the La Pérouse Expedition, but was rejected. He graduated in September 1785, 16 years old, and was posted to an artillery unit. The La Pérouse Expedition vanished in the Pacific sometime in March 1788 after leaving Botany Bay, Australia. On December 22, 1793, at the age of 24 years, Bonaparte was promoted to Brigadier General. The rest is history in our timeline. If one had the power and desire to change history, this would be a point where a little bribe to the correct person could alter the entire course of Western history.
  - This history is also notable in light of Emperor Napoleon’s later well-documented disdain for naval men. Was this disappointment the beginning?
- Payment of Generations: History is nothing without ramifications, that’s why it’s history; ramifications only stop if time itself halts. Fast forward to 1940:
  - ✓ “Like lost and bewildered children, a people broken in spirit placed their last faith in the paternal leadership of Marshal Henri Pétain, and the eighty-four year old hero of Verdun had only the solution of despair. Three generations of Frenchmen had trusted in vain to the military occultism of a General Staff which proved to be a sphinx without a secret. The failure of 1870 had been redeemed by the valor of armed citizens, while in 1914 enough allies had been at hand to turn defeat into victory. But there was no balm for the wounds of fallen France in 1940. Civilians could only share the blame with professional soldiers... Still, it would be unfair to heap too much blame

on poor Gamelin's inept leadership. Joffre and Foch must also be held to stern account. For the class of 1914 had consisted of 750,000 Frenchmen, while in 1939, only 450,000 answered the call to arms. The gaps in the ranks of the nation's defenders represented the 300,000 unborn sons of the 'human grapeshot' who had been sacrificed to the offensive doctrines of 1914 and 1915." – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), pp. 810-811.

Military historian Barbara Tuchman has been accused of being a Francophile. Likewise, some may accuse Lynn Montross of being Francophobic, or at least, unkind and unsympathetic to the French in 1940. It is important to understand, and it is clear to me from a lifetime of reading Montross that rather than being overly critical of the French military in the early 20<sup>th</sup> Century, Montross was writing lessons for the *next war*, which in 1946 and 1960 seemed sure to happen despite the fact that he opened the 2<sup>nd</sup> and 3<sup>rd</sup> Editions with this dedication to his son, "in the hope that his world may learn from books instead of bombs."

- ✓ "The enthusiasm of the country for the Maréchal was tremendous. He was welcomed by people as diverse as Claudel, Gide, and Mauriac, and also by the vast mass of untutored Frenchmen who saw him as their saviour." – Richard Griffiths, Pétain (1970) as cited in Wikipedia article, "Philippe Pétain," captured March 5, 2019.
  - ✓ "On 11 November 1942, German forces invaded the unoccupied zone of Southern France in response to the Allies' Operation Torch landings in North Africa and Admiral François Darlan's agreement to support the Allies. Although the French government nominally remained in existence, civilian administration of almost all France being under it, Pétain became nothing more than a figurehead, as the Germans had negated the pretense of an 'independent' government at Vichy. Pétain however remained popular and engaged in a series of visits around France as late as 1944, when he arrived in Paris on 28 April in what Nazi propaganda newsreels described as a 'historic' moment for the city. Vast crowds cheered him in front of the Hôtel de Ville and in the streets." – from Wikipedia article, "Philippe Pétain," March 5, 2019.
- Wholistic History: This situation demonstrates relationship between parts; within the game, participants should not view the game in isolated parts, but rather as an interconnected dynamic continuity, a milieu, a macro-history.
- ✓ "Trevor [Dupuy] wrote, 'I was brought up by my father to be both a soldier and a military historian. To him the two were inseparable, and that is the way it has always been for me.'" – Susan Rich, biography page for Trevor N. Dupuy at The Dupuy Institute website (<http://www.dupuyinstitute.org/tndupuy.htm>).

This also represents the way I have come to view macro-history and macrosociology as being related and inseparable.<sup>10</sup>

- ✓ "Jan [van der Crabben] also had the idea that history was not linear (as it is taught in most school course books), but rather a very parallel type of story, where everything is interlinked." – from About page, Ancient History Encyclopedia, August 30, 2019.

Macro-history and to a lesser extent, macrosociology are like riding in the back of a military transport plane or helicopter which has a back ramp that is up: You cannot see the ground below or even what you just passed over by looking through the open gap at the top, but you can see in the distance what you passed over a while ago.

- **Universal Translation:** In the preceding discussion – in GGDM game terms – in the mid-19<sup>th</sup> Century, the military college was allowed to decline in favor of governmental stability, *status quo* maintenance, and reliance on superior logistics and technology (e.g., oceangoing ships, rail, industry) to hold together and expand colonial empires. The result was a series of embarrassing defeats of European regular military forces by technologically inferior (but well led and fanatical) native tribesmen, Prussian expansion, and a pointless and badly executed Continental War on the Crimean Peninsula. In each instance of colonial defeat, European powers were then required to amass huge forces to finally overcome native resistance (e.g., the Zulu War (1879), the Boer War (1899-1902)).

*“The years from 235 to 297 were given over to anarchy ruled by sword or dagger. Forty-six emperors or pretenders were slain or assassinated in strife that drew most of the legions away from their posts. With the border left undefended at vital points, the barbarians found an opportunity to add invasion to the horrors of civil war.”*

– Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 87

**The Fog of Lützen:** Sixty-two years, forty-six emperors or pretenders slain. Step right up!

The separation of military command and political power – i.e. the sociopolitical installation of boundaries – had been in process for some time before the 20<sup>th</sup> Century and intensified after Napoleon’s final defeat in 1815, frankly, at some point, the ancient and medieval idea of monarchs personally commanding armies in battle passed from our culture (e.g., Richard I of England was a real knight with a reputation for bravery and combat prowess, rare even then for a king), which is what makes Independence Day’s (1996) final battle so outrageous. Legitimization of power by the Church, population growth, empiricism, and increasing complexity may have all contributed to this boundary intervention; trial by combat was no longer either justice or justification.

This is a favorite rallying cry of anti-war protestors, e.g., Black Sabbath’s “War Pigs” (1970): they (erroneously) assume that if political leaders had to ‘fight’ at the front, there would be no war, they assume that political leaders avoid military command and stay in the rear areas out of cowardice and ignorance – noting, however, that many political leaders of the highest levels have served in the military in their youth. Personal courage has been long separated from politics.

- ✓ During the War of the Sicilian Vespers (1282-1302), Charles I of Anjou (King of Naples) offered to settle the matter with Peter of Aragon in trial by personal combat, on June 1, 1283 in Bordeaux, with six knights on each side; Edward I of England refused to adjudicate the combat, which never happened (no one really seemed committed to the idea overall), the whole thing was probably a dilatory diplomatic ploy by Charles. Trial by personal combat over a city is a famous scene from the movie *El Cid* (1961).
- ✓ James IV of the House of Stuart, King of Scotland appears to be the last *English-isles* monarch killed in battle; he died fighting the English at the Battle of Flodden in 1513.
- ✓ Gustavus Adolphus of Sweden personally commanded his armies. He was killed at the Battle of Lutzen in 1632 while leading a cavalry charge, described by Montross as “The Fog of Lützen.” (War Through the Ages, p. 283). His successor was the highly educated, very unusual lady, Queen Christina, who abdicated in 1654, never married, and traveled throughout Europe, living much of the rest of her life in Rome.

- ✓ The Self-denying Ordinance of 1645, during the English Civil War, explicitly separated membership in Parliament from leadership of the Parliamentary Forces so that political disputes would not affect command of the army. It was critical to victory.
- ✓ George II was the last English monarch to personally command troops in battle, at the Battle of Dettingen in 1743 against the French in Bavaria. King George's horse panicked and he was rescued by an Ensign who was the son of Huguenot refugees who had fled France after the Edict of Fontainebleau (1685).
- ✓ Frederick the Great was personally commanding Prussian armies in the 1750s and possibly later. He wore a plain field uniform which was often stained with snuff, and lived a soldier's life with little regard for comfort. Because the Prussian state and army were so closely tied – some claim indistinguishable, political and military fortunes and considerations were similarly indistinguishable.
- ✓ In France, of course, Emperor Napoleon personally commanded French armies in battle until 1815 and Napoleon III infamously personally surrendered to the Prussians at Sedan in 1870 (though he didn't seem to be much in actual command). And that was his political end and the end of the Second Empire.
- ✓ Tsar Nicholas II personally assumed command of the Russian armies in September 1915: "This was a mistake, as the Tsar came to be personally associated with the continuing losses at the front. He was also away at the remote HQ at Mogilev, far from the direct governance of the empire, and when revolution broke out in Petrograd he was unable to halt it. In reality the move was largely symbolic, since all important military decisions were made by his chief-of-staff General Michael Alexeiev, and Nicholas did little more than review troops, inspect field hospitals, and preside over military luncheons. ...

Cut off from public opinion, Nicholas could not see that the dynasty was tottering. With Nicholas at the front, domestic issues and control of the capital were left with his wife Alexandra. However, Alexandra's relationship with Grigori Rasputin, and her German background, further discredited the dynasty's authority. ...

The Tsar's Cabinet begged Nicholas to return to the capital and offered to resign completely. The Tsar, 800 kilometres (500 mi) away, was misinformed by the Minister of the Interior, Alexander Protopopov, that the situation was under control, and he ordered that firm steps be taken against the demonstrators." – from Wikipedia article, "Nicholas II of Russia," captured April 30, 2019.

This encapsulates perfectly why personal military command has gradually separated from political power; military commanders can be promoted, blamed and dismissed, but if the political powerholder is in personal command of the armies, there is no one else to blame.

- ✓ Leopold I, Holy Roman Emperor, fled Vienna before the Ottoman Turks arrived in 1683. In the movie *The Day of the Siege* (2012), in a panic attack he states, "If Vienna falls, we can always reconquer it. But me? [whimpering] He will kill me and my two male sons. ... The dynasty will end." ("my two male sons?" – bad dialogue)
  - ✓ See also Lynn Montross' discussion of Moltke's reforms, 5 *Combat*, p.1008, *infra*.
- History or Space Opera?: However in science-fiction stories, at least earlier space-opera stories made to appeal to youth audiences, *the political leadership was often involved in combat and sometimes fittingly died*. Space-opera fiction, a parody of Earth history, has imagined

galactic empires forged by warrior kings and ‘barbarian’ invasions from the outside (echoed by the 2011 card game, Core Worlds). In Traveller RPG, an early period of the Third Imperium was marked by wars of dynastic succession in which a line of admirals, called the Flag Emperors, ascended the throne after defeating their rivals, then died shortly through assassination, misfortune, or in battle with the next challenger. This was clearly inspired by late Roman history, especially the Year of the Six Emperors (238 A.D., Crisis of the Third Century) and later Byzantine succession crisis – 12 Byzantine Emperors (13%) reigned for less than a year, 9 more for a year to 30 months, 23 Byzantine emperors died violently and only 6 of those were assassinated, source, <https://byzantium.gr/statrgrn.html>, April 30, 2019.

- ✓ Whether ‘natural experiments’ of *history or speculations of space-opera fiction* informs play of GGDM is up to the participants (both are featured copiously, alternately throughout, *current events* are history as soon as they are known, appear), but likely the participants will bring into the game the *leadership separation concept* of the current milieu. And again, the concept of individual leaders – political or military – in GGDM bumps up hard against the time scale of GGDM and the ‘no literary characters’ discussion in *A Story Without Characters*, 4 *The Streams of Time*, p. 102, *supra*.
  - “When I wrote the *Handmaid’s Tale*, *nothing went into it that had not happened in real life*, somewhere, at some time. The reason I made that rule is that I didn’t want anybody saying you certainly have an evil imagination, you made up all these bad things. I didn’t make them up.” – Margaret Atwood, Master Class video trailer (emphasis added).
- ✓ Most broad judgments by historical writers are valid points – as lessons drawn from historical facts – ‘natural experiments’: A fantasy setting could be constructed for each where the point would be just as validly drawn from the invented facts. Teachers (esp. law school professors), fiction writers do this regularly as a matter of course.

---

*“Eurisko (Gr., I discover) is a discovery system written by Douglas Lenat in RLL-1, a representation language itself written in the Lisp programming language. A sequel to Automated Mathematician, it consists of heuristics, i.e. rules of thumb, including heuristics describing how to use and change its own heuristics. Lenat was frustrated by Automated Mathematician’s constraint to a single domain and so developed Eurisko; his frustration with the effort of encoding domain knowledge for Eurisko led to Lenat’s subsequent (and, as of 2019, continuing) development of Cyc. Lenat envisions ultimately coupling the Cyc knowledgebase with the Eurisko discovery engine.”*

– from Wikipedia article, “Eurisko,” captured August 31, 2019

---

**Imperial Admiral Eurisko:** Eurisko was an AI program by Douglas B. Lenat that won the 1981 and 1982 Traveller RPG Trillion Credit Squadron Tournament. Similar processes are now used to predict the outcomes of professional sporting contests based on 10,000 simulated games; the difference is raw processing power, no human can or will sit and play through 10,000 simulations. It is rather amusing that Traveller players and designers were concerned or bothered about what Eurisko did: The high technology future is fun in fantasy, but is rather threatening face to face. Thus, the appeal of movies like Terminator, The Matrix and Wargames (1982).

- ✓ “Eurisko’s fleet was so obviously superior to those of its human opponents that most of them surrendered after the first few minutes of battle; one resigned without firing a

shot.... Eurisko was creating concepts on its own. It was distilling thousands of experiences into the judgmental, *almost intuitional*, knowledge that constitutes expertise – rules that can't always be proved logically, that can't guarantee a correct answer, but that are reliable guides to the way the world works, a means of cutting through complexity and chaos....

After weeks of experimentation, and some 10,000 two-to-thirty-minute battles, Eurisko came up with what would be the winning fleet. To the humans in the tournament, the program's solution to Traveller must have seemed bizarre. Most of the contestants squandered their trillion-credit budgets on fancy weaponry, designing agile fleets of about twenty lightly armored ships, each armed with one enormous gun and numerous beam weapons....

Eurisko, however, had judged that defense was more important than offense, that many cheap, invulnerable ships would outlast fleets consisting of a few high-priced, sophisticated vessels. There were ninety-six ships in Eurisko's fleet, most of which were slow and clumsy because of their heavy armor. Rather than arming them with a few big, expensive guns, Eurisko chose to use many small weapons. In any single exchange of gunfire, Eurisko would lose more ships than it destroyed, but it had plenty to spare....

Even if an enemy managed to sink all Eurisko's sitting ducks, the program had a secret weapon – a tiny, unarmed extremely agile vessel that was, Lenat wrote, 'literally unhittable by any reasonable enemy ship.' The usefulness of such a ship was discovered during a simulated battle in which a lifeboat remained ... round after round, even though the rest of the ships in the fleet had been destroyed. To counter opponents using the same strategy, Eurisko designed another ship equipped with sophisticated guidance computer and a giant accelerator weapon. Its only purpose was killing enemy lifeboats. After Eurisko prevailed so easily, the tournament's directors tried to ensure that the 1982 championship would be different." – George Johnson, "Eurisko, The Computer With A Mind Of Its Own" (1984), Alicia Patterson Foundation (emphasis added) (available free online, linked in Wikipedia article).

***Ready to close the circle?*** Eurisko is described above as having "the judgmental, almost intuitional, knowledge that constitutes expertise." A campaign against expertise – see Tom Nichols excerpt this section – is thus a campaign against "the judgmental, almost intuitional, knowledge that constitutes expertise" in humanity and in our current civilization.

---

*"Your Majesty, so long as you have this present officer corps, you can do as you please.*

*But when this is no longer the case, it will be very different for you."*

– Otto von Bismarck to Emperor Wilhelm II

---

#### Endnotes.

<sup>1</sup> Commentary: I have avoided in this quote mentioning the belligerent nation to which it refers as that is irrelevant and distracting to the purpose for which the quote is offered. Likewise, I have deliberately omitted citing the title of the article, as this is not an argument about what certain countries did or didn't do. You can look it up if you like.

<sup>2</sup> **Commentary:** I recall a criticism of leadership of the Union Army during the American Civil War which stated that West Point produced very fine military engineers, that pre-American Civil War cadet training at West Point focused heavily on engineering, but lacked in military history, rhetoric, and other education suitable for leading.

<sup>3</sup> **Commentary:** But my STEM oriented high school in the early 1980s still clung to the term ‘social studies’ and treated non-physical sciences as poor country cousins.

<sup>4</sup> **Commentary:** I couldn’t get through the first 10 minutes of the first episode of *Nobility* (2017). It was immediately obvious that it was Star Trekish at its worst; the character introduction process was hokey and clumsy, clichéd and uninteresting. Every movie and series now has to have idiosyncratic misfit main characters, no one in the future can be mature, normal, career competent. Misfit characters have become *droll nonsense* and their introduction, in the manner of *Nobility*, wastes screen time as opposed to normal, mature, competent characters doing their jobs.

- ✓ In the reviews I read afterward, everyone else seems to like the pilot episode even when they say pretty damning things in their reviews, for example, jeezzle wrote:
  - “Well here’s where it gets a little bit weird. The whole does not seem greater than the sum of its parts despite Aristotle’s best intentions here. Every character does a decent job acting. However, no one actually seems to get it right and it almost seems like no one really has any idea what they’re doing in this show.” (<https://steemit.com/life/@jeezzle/a-jeezzle-series-review-nobility>)

But in the end, he liked it, but no one else seems to be writing reviews after its debut in July 2017.

<sup>5</sup> **Commentary & Citation:** Deleenn is commanding a White Star fleet against a Drakh mothership and escorts; “skin dancing” is an artistic tactic developed by the Warrior Caste to hug the hull of enemy ships to avoid enemy fire:

- ✓ **Deleenn:** Lennier, have you ever seen the warrior caste training flights? **Lennier:** Yes. **Deleenn:** Have you ever seen them skin dancing? **Lennier:** I have. **Deleenn:** Can you do the same thing? **Lennier:** Not without approximately... five years of additional training. **Deleenn:** That would be no, then. **Lennier:** But I can program the parameters into the ship’s artificial intelligence matrix. **Deleenn:** And what do you do then? **Lennier:** Touch that button, and pray very, very fast. – Babylon 5, “Lines of Communication.”

<sup>6</sup> **Citation:** “Quantum field theory is notoriously complicated, built from mind-bendingly abstract mathematics. But could it be that the underlying rules that govern reality are really so far from human intuition or are physicists just showing off?” – Matt O’Dowd (City University of New York), “Quantum Theory’s Most Incredible Prediction,” PBS Space-Time Channel, August 15, 2018.

<sup>7</sup> **Commentary:** For those who are interested in military sciences, I recommend *reading about* Clausewitz’ Ten Principles of War. Clausewitz – a staff officer during the Napoleonic Wars – is one of those writers for whom it is better to initially read reliable secondary sources, such as Col. Harry Summer’s *On Strategy* (1981), because his *magnum opus*, *On War* (1832), is a tough slog (however, there are some educators who would argue against reading secondary sources first). For those interested in politics, diplomacy and early-modern European history, I recommend reading Machiavelli’s *The Prince* (1532). Find a good annotated English translation of the original work to read; *The Prince* is not a long book or difficult to follow, except that he makes constant references to small matters of his time. If you are interested in military history as well, you should have a copy of Dupuy & Dupuy’s *Encyclopedia of Military History* (2<sup>nd</sup> Revised Ed., 1986), *The West Point Military History Series: The Second World War* (50<sup>th</sup> Anniversary Commemorative Edition, 1989), and of course, Lynn Montross’ *War Through the Ages* (3<sup>rd</sup> Ed, 1960).

<sup>8</sup> **Commentary & Citation:** In science-fiction gaming:

- ✓ “Lucan had not evacuated or moved the research station, for he no longer had an officer corps that would bring controversial decisions to him. He had successfully purged the navy of this kind of honesty and courage by executing officers accused of ‘defeatism.’ What remained were officers who correctly divined what Lucan wanted to hear, and who kept one eye constantly over their shoulder and one hand on their necks.” – Dave Nilsen, “When Empires Fall II,” Challenge Magazine, Issue 69, February 1993.

<sup>9</sup> **Commentary:** This is not without controversy, there were others who may have been overshadowed by Ms. Nightingale’s fame, and as a famous figure, like all others, she becomes the lightning rod for whatever social issue or revisionist history dominates the day, with intellectuals constantly re-evaluating and poking at her legacy to make this or that point in support of their current agenda.

<sup>10</sup> **Commentary:** By extension, if I possessed a greater understanding, I might also include macroeconomics in a macro-triumvirate of human studies. I do not get the sense that this relationship is generally appreciated and perhaps that has been an impediment to the development of a general macro-understanding, with the exception of macroeconomics which is deemed to have desired and practical uses in the ‘real world.’

## **Every solution to mass shootings inevitably involves a serious trade-off**

By Dan McLaughlin, Los Angeles Times, February 15, 2018

It is, by now, a horrifyingly familiar story. Indeed, the familiarity is what should horrify us the most: A school shooting with a bunch of people dead, many of them children, the rest teachers. This time, it's a high school in Parkland, Fla., 17 dead, the shooter a 19-year-old who had been expelled from the school. The assailant, armed with a popular rifle and loaded up with ammunition, was injured at the scene.

What can we do? What should we do?

The answers are not easy, and they inevitably involve a tradeoff: accepting the unacceptable, or restricting our freedoms. The three big ones are freedom of the press (publicity gives oxygen to these kinds of acts, so restricting coverage will reduce copycats); the right to bear arms (guns don't cause human evil, but of course they make it easier to carry out); and due process (targeting potential mass shooters, or mentally ill people in general, is possible, but requires us to curtail Americans' civil rights before they have actually committed a crime).

It is by no means clear that any of these solutions would be more effective than the others, and each of them involves punishing a very large number of people in order to stop the evildoings of a very small number of people.

The kneejerk reaction is to go after firearms, but there's a bait and switch element to gun control arguments in these situations. Activists focus on small restrictions that are palatable to many. If anyone points out that small restrictions won't do much to stop shootings, the activists argue that larger restrictions, unpalatable to many, would do the trick.

Gun owners are used to hearing, almost in the same breath, "we'll stop shootings by banning all guns" and "nobody's trying to take your guns away."

That doesn't mean, of course, that it's impossible to affect any change whatsoever. As with "bump stocks" after the Las Vegas shooting and body armor after this week's police shooting in Chicago, Parkland is likely to rejuvenate proposals for highly specific restrictions – in this case of smoke bombs and protective gear like gas masks. But a ban on protecting yourself with a gas mask seems a very unsatisfying solution. Censorship presents the same dilemma. The 1st Amendment makes it just as impossible to ban coverage of mass shootings as the 2nd Amendment makes it impossible to ban guns. Media outlets should, if they want to promote safety, refuse to publicize the names of the shooters. But not cover the shootings at all? That could be effective, but these are traumatic and newsworthy community events. Silence is a fantasy; it will never happen.

And even if the mainstream media goes dark, there's social media. Our exhibitionist culture may encourage disturbed people to perform acts of retribution that guarantee them maximum publicity; think of the mass shooter as taking a kind of mass selfie of rage. But that genie can't be put back in the bottle, either, at least not without a massive campaign against freedom of expression.

As always, human beings are the real weapons of mass destruction, and the tools they choose are not the causes of violence. If we want to weed out people who might commit violent acts in the future, we need to scale back due process protections and incarcerate more people on less evidence. Although that too is a tradeoff many of us would find it hard to make, we could

plausibly target privacy laws that make it difficult to compile records on people with a history of threatening behavior.

Defensive measures are a hollow promise. It's prohibitively expensive to provide every school, movie theater, workplace, hospital or other "soft target" with an armed guard, and unrealistic to expect grade school kids to pack heat to stave off the rare but prepared psychopath.

Nor is there a handy social or religious answer. The sickness that leads people – typically young men – to this kind of act may be in some ways emotional or spiritual, but history gives us no reason to believe that there is a key to preventing an angry minority of people from going bad. There never has been, and there never will be.

There are only easy answers if you are willing to sacrifice rights you don't care about, and that other people do. That's never been a kind of solution Americans could pursue without embarrassment and regret. Unless and until we can find a better, more reliable way to identify potential mass shooters early, we have to acknowledge the nature of the choice before us: Punish many innocent people or remain mostly defenseless against the malicious few.

Nobody wants to make one side of that trade. But nobody wants to face the other side either.<sup>1</sup>

---

<sup>1</sup> Commentary: Instead of banning firearms, we need to ban stupid people. Logically, that should be easier to do since there are more guns than people in the U.S. currently.

**Entropy & Evolution:** Entropy rules the universe. Destruction always seems easier, faster, and more natural than creation. The fire burns the wood too quickly, fire burns the Library even more quickly, destroying names, poetry, literature, records, knowledge and ideas.

Gravity, magnetism and other forces of attraction impose some order on the universe, but as often as not, even they do the work of entropy. In order for evolution to occur, the previous arrangement must suffer entropic effects. Evolution and entropy are inextricably related.

- ✓ **Doctor Who:** Stars implode. Planets grow cold. Catastrophe is the metabolism of the universe. I can fight monsters. I can't fight physics. – Dr. Who, “In the Forest of the Night” (2014).

Life develops in environments created by gravity, magnetism, and the other forces of attraction. Intelligent life develops occasionally in these places as well, and intelligent life creates complex systems, changes the environment and imposes its own order. Intelligent life pollutes the worlds on which it develops, breaking down the environmental systems of their world, wars among themselves, destroying their systems, so that they have to leave and go into space. Oftentimes, intelligent life, and even life, are the agents of entropy.

- ✓ “So you are asking me as a psychologist. ... Then as a psychologist, I'd say you are confusing suicide with self-destruction. Almost none of us commit suicide, and almost all of us self-destruct. In some way, in some part of our lives. We drink, or we smoke. We destabilize the good job or the happy marriage. But these aren't decisions, they're ... They're impulses. In fact, you are probably better equipped to explain this than I am. ... You are a biologist. Isn't self-destruction coded into us? Programmed into each cell?” – Dr. Ventress (who was dying of cancer), *Annihilation* (2018).

- See also *Neurotic Paradox*, 4 Culture, p. 413, *supra*.

A starship flying through interstellar space is a little pocket of life and order in the vast entropy of the universe, even as it is violating the relativistic speed limit of the universe through which it is flying. At the very least, the movement of the starship causes a disturbance, which then becomes the external entropy force that destroys, disturbs, or changes something else. Sometimes when starships arrive at planets, wars are fought and the planet is bombarded and/or damaged, and the starship becomes the messenger of entropy.

Order is the most basic function of the governments and central authorities of a civilization to impose a system and maintain it against internal and external threats. But whose system, whose order, among the competing authorities and interests will prevail? The process of competing systems and interests does the work of entropy, destroying lives, structures, knowledge, and hopes. Those who are not in power in the current system, welcome entropy with open arms.

- ✓ Once the frame of the GGDM simulation was moved to space opera, I asked “Well, what is the equivalent of natural disasters on Earth in a space setting?” For simulation purposes, the answer was Entropy and humans were their own constant. All else – Disruption Events, Interpretations, Interventions, Diplomacy – evolved from there.
- All Things Must Pass: ‘All things must pass so that new things can enter the world,’ however attractive, is a teleological explanation of death and destruction phrased as a meta-physical *a priori* law. I must die so that the world can move on would be a false statement (unless you are a messianic megalomaniac or fictional hero), but I will die and the world will move on would be an eventually verifiable prediction. Whatever truth is apparent in the ‘all things must pass’ statement – which has been handed down for two thousand generations – it is still suspect for being a human teleology. But time is the ultimate teleology function of this universe and thus, teleology statements regarding or implying time are probably the most valid observations. See discussion of teleologies, Patently Off Limits, 3 Patents, p. 750, *infra*.
  - ✓ Even Rose Tyler in Dr. Who avoids this statement in the Bad Wolf speech, saying only “Everything must come to dust. All things. Everything dies.” Phrased in this way, it is simply an empirical observation, not contradicted by any current scientific knowledge, with possible philosophical implications (sort of like quantum physics).
- Organizations: Organization is what allows the office to continue functioning when you go on vacation. Organization leads to more efficient use of the time in a day. Organizations, such as corporations and foundations, continue operating long after their founder(s) have passed or moved on, they are entities independent of any one of us. Organizations multiply the effect of one person a thousand-fold by propagating the ideas and techniques through others, and into the future. Organizations require remote authority, by which the members of the organization maintain the organization without the one person or small group being present to supervise and enforce their will. Organizations require and imply systems and order. Civilizations are organizations. Civilization is inconceivable without the kernel of organizations.
  - ✓ Or in case of civil war: There is a necessary argument that during all of the civil wars and power struggles, the Roman Empire continued to function because the lower administrative systems held it together.
  - ✓ Ants rule the jungle, no other creature, including humans, match them in organization, determination, numbers, cleverness and ferocity. Humans survived first because of mastery of fire and our body size, later, humans damaged their environment. See previous discussion, 1 Entropy, *supra*.

---

*“If the basis of popular government in peacetime is virtue, the basis of popular government during a revolution is both virtue and terror; virtue, without which terror is baneful; terror, without which virtue is powerless. Terror is nothing more than speedy, severe and inflexible justice; it is thus an emanation of virtue; it is less a principle in itself, than a consequence of the general principle of democracy, applied to the most pressing needs of the patrie.”*

– Maximilien Robespierre, “On the Principles of Political Morality,”  
February 1794

---

**Red Guards:** To those familiar with the history of the Reign of Terror, these are some of the most chilling words in history; they sound so high-minded and reasonable, but what followed were hundreds of deaths by execution, called the Reign of Terror, which ended, as history always notes, by the execution of the speaker of those chilling words. Robespierre was the difference between the American Revolution and the French Revolution. Jefferson was a scary radical, but he was no Robespierre, and the newly-formed United States had the Western Frontier, an outlet valve; whereas France was a self-contained, complex, developed nation in a radical revolution.

- ✓ “‘I can’t help thinking of Bannon as the Robespierre of this Trumpian revolution, ultimately devoured by the forces he helped release,’ emailed Charlie Sykes, the legendary conservative radio host in Wisconsin who has emerged as a leading Trump critic. ‘He helped create a pro-Trump media ecosystem that demanded loyalty, not ideological consistency. Now that he is perceived as disloyal (and perhaps dangerous), he is going to get the same treatment he used to give the globalist, establishment types.’” – Charlie Sykes, cited in the Washington Post, January 4, 2018.

Chairman Mao Zedong, educated in France and well-read in Western political works, and familiar with Chinese history, let loose upon China a deliberately-fashioned Chinese version of the Reign of Terror in the form of the Red Guards in August 1966. The damage to traditional Chinese culture was and is immeasurable, and it took years for the government to regain control of the countryside from the radical, feuding student militias. Prior to the Communist Revolution in China, the Taiping Rebellion – whom the Chinese Communist lauded as historical predecessors – had devastated Buddhist and Confucian places and destroyed their libraries and schools.

Like “The Needs of Earth” episode of the Babylon 5 spinoff series Crusade, the Chinese will want back someday what their revolution destroyed. Hopefully, enough is preserved in places such as the Fei Tian Academy of the Arts and Fei Tian College, a classical Chinese Dance school in New York City (very closely related to or intertwined with Shen Yun Performing Arts company),<sup>1</sup> that some of their culture can be returned to China when the time is right.

**To Insure Domestic Tranquility:** One of the most fundamental prerogatives of a society is to impose and maintain order, and not just on the level of criminal activities and what constitutes morally right and acceptable behavior, but also on how reality is divided up, what parts connect, and what constitutes knowledge. Of course, a few criminals are occasionally useful too.

The Order Power must be activated for any of the following purposes:

1. Declare/Move Capital Colony,
2. Conversion/Naturalization (of a conquered **alien colony**),
3. Maintenance,
4. Government Formation (see Government Titles, *infra*).

Activation of the Order Power for the purpose of Declaring or Moving a Capital Colony requires one Act and one Scene on the target colony. Activation for the purpose of attempting to Convert or Naturalize an **alien colony** requires one Act and one Scene on the target colony. Activation for the purpose of maintenance will require one to three Acts. Declaring or Moving a Capital Colony and Maintenance also cost RPs from the Treasury. Finally, the actions regarding Government Titles are fully detailed in the section following the Order Section.

- **Gaveling:** Activation of the Order Power for the purpose of Declare/Move Capital Colony, Maintenance, and Government Formation can never fail due to inactive Constructural Elements. Conversion attempts are also never effected by inactive Constructural Elements on the target colony. Naturalization attempts, however, may fail due to inactive Constructural Elements at the target colony.

- ✓ Mainly this is for game convenience as citizens in the capital areas have historically had a disproportionate effect on the national government; e.g., Paris Riots that led the French monarchy to build a palace in Versailles, and the later ideological riots during the French Revolution. Or the St. Petersburg Massacre in front of the Winter Palace. Capital population is the most immediate threat to a national government, all other agitators have to march on the capital from a distance, e.g., the 1922 March on Rome, the 1958 French Algiers uprising that got as far as Corsica, or the War of the Roses.

While there may be some general argument that declaring or moving a Capital Colony is location-specific and thus subject to inactive Constructural Elements, *for game convenience*, those are ignored due to the importance of each position having a Capital Colony at all times in GGDM (thus, it is a *game play concession*). The Concierge can address resistance to the Capital Colony move through creative Interventions, raising the issue above to a story event.

---

**Dr. Hans Fallada:** *Death, Colonel Caine, correct. Thanatology's the name for it. Death for you, Colonel, is a bureaucratic problem. Who did it? When, why did they do it? A problem to be solved, am I correct?*

– Lifeforce (1985) <sup>2</sup>

---

**Crime & Punishment:** I have a neutered female tabby cat whom I rescued from the basement of a house where her owners had moved out. She was emaciated when I adopted her; that was ten years ago. She was not raised with other cats and didn't get along well with the other feral kittens I brought in later, especially when they grew up to be tom cats (they are neutered as well). It was becoming a problem. So I allowed her to live in my bedroom, an enclosed area containing my bathroom and one other room. She has been there for nine years, she seemed to be happy in the space, with the big window and cat condo, and we had a great relationship, she was a loving cat. When I adopted her, the humane society vet opined that she was 2-3 years old, now she must be 12 or 13 years old. She is in good physical health, a slightly fat, lazy happy tabby.

In the last summer, she has begun urinating on my bed during the day; inappropriate urination has not been a problem in the past and the other cats downstairs do not urinate on my furniture or carpet. She has a nice enclosed cat box that she has used for years, and it was not unclean. You can imagine how angry it would make you to come to bed at night and find out that the cat urinated on your sleeping place. I tried scolding her, yelling at her, I became very angry with her. Each time this happened, about five times in two weeks, I'd have to sleep downstairs on the love seat and the next morning, tear apart my entire bedding and shove it into the washing machine.

After some time, I reasoned that if she could not be convinced not to urinate on my bed, she could not be in my bedroom any longer (I have not been able to keep her off my bed); I took her out of the bedroom area and put her in a large 'two level' wheeled cat cage downstairs. She clearly disliked the cat cage and after a week, I relented and took her back up to the bedroom. The next morning, two hours after I got up, I discovered she had urinated on my bed again (she

has not urinated on the bed while I was sleeping in it). I had no choice but to put her back into the cage, after I cleaned it with the vacuum cleaner and a wet rag.

- Incarceration: This is really not much different than the penal law solution – incarceration of humans who will not be convinced to act appropriately in our society; especially those who commit major offenses and are deemed to either be a danger to the public, a danger to themselves, a flight danger, or in danger of physical retaliation from the public or their victims or their families.

- ✓ Or as George Kennan said of the Soviets in 1946: [They are] “Impervious to logic of reason, and ... highly sensitive to logic of force.” This is true of the 1%.

If they have not been convinced or deterred, and there is sufficient evidence that they have committed crimes, they must be removed from society, either by some form of incarceration or by execution. Not because it’s ‘right’ but because it’s the most and the only practical solution currently available, and all other post-criminal solutions (including capital punishment) devised have not provided convincing evidence of effectiveness.<sup>3</sup>

- ✓ “Appeal to force is never an argument,” said my formal logic instructor at Point Park College. At the end of the lecture on informal fallacies, he added, “While appeal to force is never an argument, have you ever tried to convince a three year old that it’s time to go to bed when he doesn’t want to?”

Criminal laws are an appeal to force argument for those in our civilization who will not be convinced otherwise. Criminalization of dissent, *per se*, even if not explicitly stated, is an admission by the government that its arguments have failed to convince or quiet a significant percentage of the population or those who matter.

- Recidivism: Nor is this much different than the recidivism problem (except of course with those who were executed); less than 12 hours after being reintroduced to my bedroom space, she urinated on my bed again and had to be put back into the cat cage. She has failed, apparently, to make any causal connection between scolding, my anger at her, being confined to a cage, and her acts of urination on my bed or at least, they have not deterred her.

Recidivism rates are the most bedeviling problem of criminal punishment. Some states adopted three-strikes laws in sentencing aimed at those who have previously been convicted of serious or violent crimes and are back before the court again accused of serious or violent crimes. Politicians fear the public and media outcry over a preventable, serious violent crime or repeat crime committed by someone recently released from prison.

I recall from criminology class that a study found that the majority of the crimes committed in Baltimore over a multi-year period had been committed by a shockingly small group of people, pointing to criminality as a sort of profession, fulltime occupation, for a select group of people: These people plan and commit crimes (sometimes spontaneously) like you get up each morning and go to work.<sup>4</sup>

My brother had a friend who had been sent to a juvenile detention center when he was 16 years old. People argue that juvenile detention centers are toxic environments and do more harm than good; but consider how the child ended up there? He was released as an adult; three days later, he stole a pickup truck, broke into a recycling center, drove the crane around, picked up a cube of compressed aluminum cans, put it in the back of the truck, and

drove off. He was caught shortly and re-incarcerated as an adult; my brother said he was the dumbest human he had ever met.

- ✓ I am aware that I am shortcutting through a huge amount of hot and emotional controversy relating to juvenile detention centers, and adult prisons. There is much human fallacy on both sides of the bars. The human penal system depends on the incarcerated being at least marginally better than the incarcerated, while they are locked in the same cage together. Just as soldiers in a warzone are expected to somehow keep their humanity. And that frequently doesn't happen and our systems have not been sufficient to insure that it does. I recommend watching the movie *Sleepers* (1996).
- Failure of the Why Not Question: The second sense in which Order is used in GGDM is that of enforcement of appropriate behaviors. It is possible (likely) that universal entropy expresses itself in human criminal or deviant behavior, and thus there is a rough continuum from the first sense of Order discussed at the top of this document.
  - ✓ The *gravest harm and disorder occurs* when a civilization forgets or distorts its own previous answers to the Why Not question for any convenience or ideology.

Almost every legitimate reason for terminating a relationship in our society – marital, social, employment, contractual, business, parental, guardian, romantic, cooperative, fiduciary, educational – is reducible to the failure of a party who has a duty, to act appropriately, and a breach of the relationship as a result. It is the situational failure of the Why Not question. Across human civilizations, there are certain classes of inappropriate behaviors that are universally considered punishable as crimes (Why Not Behaviors), broadly they are:

- ✓ Murder and homicide except in defense,
- ✓ Theft in all its many, many guises,
- ✓ Contraband (trading in material goods banned by society),
- ✓ Kidnapping (universally, forcibly taking and restraining a person),
- ✓ Wanton destruction of another's property (arson, vandalism, mischief),
- ✓ Rape (previously considered a crime of trespass, but now not generally),
- ✓ Violation of ownership rights (trespass, breaking, conversion),
- ✓ Disloyalty (treason, sedition, espionage),
- ✓ Violation of duty of public office or fiduciary duty (corruption, official intimidation).

Finally, although it varies greatly, every civilization has had some controls on who can have sex and how, and limits on the provision of sexual services (in all forms) for material gain.

- The Other Hole in Your Head: Within this last summer, there is, I believe, a person in my neighborhood who 'delights' in hurting cats. In the spring and early summer of 2019, I had at least three cats come to my porch with injuries that I thought were consistent with being shot with a BB gun or CO<sub>2</sub> pistol. Twice this year, at about the same time of the night and nearly the same place on the street, a kitten has been hit by a vehicle and killed in front of my house (about six months apart), two of three kittens from a litter are now dead at less than a year old. I do not live next to a 'busy' street, I have lived in this half-populated residential area for eleven years now, and not until this year have any of my cats been killed by vehicles.

There is another sense of why crimes are crimes that is little discussed: It is repugnant for someone to 'fill' their existential void by inflicting harm, pain and death on other living creatures for their own amusement.<sup>5</sup> Don't pretend no one does this, don't look away and hum.

Repugnance is a visceral reaction, see discussion 5 Fallen to Earth, p. 1573, *infra*. Videos exist showing people swerving to hit turtles, there are also many cruelty videos on YouTube.

- ✓ People who harm small animals for amusement would do the same to humans if they could get away with it. This is at the very base of criminalizing animal abuse.
- ✓ As a practical matter, among hunter-gatherer cultures, one does not harm animals unless hunting for food and one does not take more than they need. It is harmful to the tribe and is usually codified in their belief systems honoring animal spirits.

By extension, the same applies to wanton infliction of emotional distress or destruction of property and chattels. And by extension, to a much lesser degree perhaps, are the crimes relating to filling one's existential void by excessive materialistic, hedonistic behaviors.

- ✓ The Why Not question is thus – phrased in the negative – a question of how not to fill the existential void that all of us carry around. Only the most extreme behaviors which are deemed harmful or not useful to society (the positive version of the question is what meaningful behaviors are useful and to be encouraged in society) are criminalized (excepting criminalizing political opposition), but the Why Not is not limited simply to either individually or collectively to criminalized behaviors.
- Feline Acedism: I also had issues with another of my house cats during that time, a 15 pound black and white neutered male who was also peeing in inappropriate places; the other cats were not allowed into my bedroom so he could never have urinated on my bed (it could only have been the female tabby). As it turned out, he had a blockage and had to be admitted to the veterinarian hospital two days before Christmas 2018, my poor kitty spent the holiday in the hospital for an emergency urinary catheterization. So after that, all of my cats were fed prescription SO cat food exclusively and I observed no additional inappropriate urinations, further, they all seemed to be happier and more active than previously. The female tabby was included in the feeding program, and after about three months of the prescription Urinary SO diet, I decided that her inappropriate urination on my bed might have been a symptom of a potential blockage.

As such, I decided to allow her to reside in my bedroom again and observed that she was regularly using her litter box. She was so happy to be back in my bedroom, out of the cage, and soon it was just like the old days... About a month and a half after she was returned to my bedroom, I came home from the gaming club late on a Saturday night, and she had urinated two places on my bed. One of the places was below the pillows, right where I sleep – the human mind immediately thinks that had to be intentional messaging. Of course I wasn't the least bit pleased with this, and resignedly returned her to the cage and slept on the couch that night. Unlike a human child, I cannot ask her why she did it, I cannot even be certain that she understands that she did anything at all, or that she has any memory of it or makes any causal connection.<sup>6</sup>

But clearly there was something else involved in her urination on my bed than potential physical urinary problems, for example, perhaps it was a feline form of acedic rebellion, even though I have regularly allowed other cats into the room in short supervised visits over the years and even though we don't think of acedism is a feline 'problem' considering that they sleep 14 hours a day.

- ✓ “Acedia is a state of listlessness or torpor, of not caring or not being concerned with one’s position or condition in the world. It can lead to a state of being unable to perform one’s duties in life. It is related to depression. Acedia was originally noted as a problem among monks and other ascetics who maintained a solitary life. ... Evagrius’ contemporary, the Desert Father John Cassian, depicted the apathetic restlessness of acedia, ‘the noonday demon,’ in the coenobitic monk.” – from Wikipedia article, “Acedia,” August 4, 2019.

So again, I had no other sensible, humane solution than to return her to the cage.

---

*“The four orders [of natural phenomena] are the inorganic, the vital organic, the mental organic and the super-organic, or social.”*

– Clarence Marsh Case, Outlines of Introductory Sociology (1924) p. xvii <sup>7</sup>

---

**Order of Genesis:** I believe that it is inherent in Mr. Case’s scheme that the four orders of natural phenomena are incommensurable, it is the incommensurability that defines them as orders; that incommensurability in successive things (entities, ideas, civilizations) is evidence of emergence; in Mr. Case’s four orders, they may be evidence of successive unfolding cosmic emergences, a progressive fracturing of the universe as it expands (see Big Bang Theory, 1 The Big Bang, p. 2, *supra*). However, emergence is not a case of complete non-linkage, it is simply the case of the unexpected or a whole that is greater than the sum of its parts emerging from what came before, therefore a continuum may be formed (and has begun to be formed intellectually in the West) through a series of what we have termed as “genesis” events:

- ✓ *Abiogenesis* (1870), the theory that life (the second order of natural phenomena) arose naturally from the physical universe, inanimate matter (the first order of natural phenomena) serves to connect the first and second orders of natural phenomena in the evolution of the current universe.
  - “This is a cell. Like all cells, it is born from an existing cell. And by extension, all cells were ultimately born from one cell. A single organism, alone on planet Earth, and perhaps alone in the universe. About four billion years ago one became two. Two became four. Then eight, sixteen, thirty-two. The rhythm of the dividing pair, which becomes the structure of every microbe, blade of grass, sea creature, land creature, and human. The structure of everything that lives and everything that dies. As students of medicine, as the doctors of tomorrow, this is where you come in. The cell we are looking at is from a tumor. Female patient, early thirties, taken from the cervix. Over the course of the next term, we will be closely examining cancer cells in vitro and discussing autophagic activity.” – Lena, university lecture, *Annihilation* (2018) (Note: Lena and Kane were never given last names, like Adam and Eve perhaps?).

The question of abiogenesis is the emergence of that first cell, from the first order of natural phenomenon to the emergence of the second order.

Abiogenesis is a theory properly because it proposes a question, proposes an answer, and can be tested, is testable, we can poke and prod our way to answers and confirmation by experimentation and observation, and sub-theories, the ultimate proof of

which will be when we can find a repeatable process to create life from inanimate matter. So well is that, but...

- ✓ *Psychogenesis* (1838), a concept of phenomenology and psychology, currently connects the *second order of natural phenomena* (life, biology) to the third order of natural phenomena (psychology, sapience, the mind, biological awareness). Theories on the evolution of the brain and nervous system, also help to bridge the gap between the second and third orders of natural phenomena.
  - “Perinatal experience is posited as generative of psychogenesis: the psychological birth of the infant. The process involves a sentient human being rather than a nonconscious tabula rasa fetus. That birth experience is only traumatic is reductionist. The origins of positively colored affects as well as sexual feelings and even ecstasy may be intrauterine. The importance and complexity of the birth experience can better be described in terms of phases of being that parallel the physical stages of labor. These phases are immanence, obstruction, descent, experience, ascent, emergence, and transcendence. Each of these phases encompasses a unique state and dynamic process. Birth as such is shown to be a rich multidimensional experience that is also transformative.” – abstract of Stephen Slade Tien, “Psychogenesis: A Theory of Perinatal Experience,” *Journal of Phenomenological Psychology*, Vol. 23, Is. 1, January, 1992.
- ✓ *Noogenesis* (1955) is related to psychogenesis, sort of a little sis, with new generation thoughts. Noogenesis (phylogenesis & ontogenesis) seems to focus on the species as a whole and thus might shade over toward connecting the second order to the fourth order of natural phenomena, whereas, psychogenesis seems focused on individual members of the species (e.g., see previous endnote). But are noogenesis and psychogenesis testable (and in what way?), and thus, are they really theories?<sup>8</sup>

And here, more than anywhere else, stands the bright shining line that divides human ‘knowledge’: The first and second order of natural phenomena (the physical universe and the biological), and their abiogenesis connector, are testable, repeatable, can be numbered, expressed in laws, defined, applied, and engineered. We call this science, medicine and technology, except that we cannot yet get the abiogenesis down. After that, it all gets a bit fuzzy, some of it is philosophy, some of it is social sciences, some humanities, some psychology, and all of it generally not testable or repeatable, or even physical within our current framework:

- ✓ The bright line is between the *objective and the subjective*, in studying third and fourth order natural phenomenon, we are studying ourselves on two different levels, and that is always more so subject to the times, interpretations, opinions, and needs all of the evolutions and time possible to humanity to arrive at the core truths. The previous error is that it doesn’t make it any less ‘real’ either to us or to the universe.

Imagine an epochal dimensional evolution where the framework for understanding the third and fourth orders of natural phenomena become evident in the way that we understand the ‘lower orders’? See epochal FTL discussion, 1 Stardrive, pp. 783-785, *infra*.

What sits between the third and fourth order of natural phenomena? What connects? What explains the link between biological awareness and the super-organic? How did the universe develop the super-organic from biological awareness as it did life from the inorganic? *Hint?*<sup>9</sup>

- Tyranny of Tendentious Pedants: Are emergence and incommensurability absolute (i.e. 0 or 1) or a matter of degree? We seem to have not quite decided. This is not unusual, is sincerity zero or 1 or a matter of degrees? Can one believe they are being sincere, have an internal intent to be sincere, but are actually not? Can one be sincere within a set of views and intentions, but not otherwise? Can something be emergent from and incommensurable with X, but not quite when compared to Y (it may depend on the relationship of X and Y). In a sense, we seem to demand a clear break, a startling difference between the origin and outcome before declaring it emergent. And that is part of the problem, but it appears that most of the philosophers have had no issue with considering emergence in conditions and degrees:
- ✓ “Complex systems research has been hindered by a lack of precision when people refer to ‘emergent properties.’ Contemporary views of emergence in philosophy include Chalmers’ spectrum ranging from a mystical property to the whole-part relationships in mundane objects including filing cabinets. They also include Bedau’s distinction between ‘weak’ emergence, based on simulation and modeling, and ‘strong’ emergence relying on downwards causation.” – Christopher W. Johnson (University of Glasgow website), “What are Emergent Properties and How Do They Affect the Engineering of Complex Systems?” 2005.

If emergence can be considered in matters of degree, can incommensurability that I have identified as the clear marker of emergence also be considered in matters of degree? Is it a matter of proper framework? When we speak of emergence in spectrums or ‘strong’ or ‘weak’ emergences, are we really talking about incommensurabilities?

- ✓ It would be fallacious to insist that the emergence be a complete break from what came before, such would destroy the relationship inherent in the concept. But at the same time, there has to be a clear break, clearly something unexpected, different.
- As Coo-Coo as a Swiss Clock: The universe is still expanding. What would be the next incommensurable order beyond the fourth, what would be the fifth order of natural phenomenon and does it already exist but we cannot see it? We keep feeling around for it in science-fiction movies, e.g., Magellan, Arrival, Contact. Possibly the best expressed concept, in a linear development sense, is Isaac Asimov’s “Galaxia Gaia,” but we should hardly expect the next cosmic emergent order to be linear in the form of just something bigger than the current.
- ✓ Such an emergence would make facts in the fourth order also facts in the fifth order, just as first and second order facts are facts in the third and fourth orders.
  - ✓ Humanity and human civilization would not just disappear with the advent of the fifth order of natural phenomenon, just as the second order did not disappear with the advent of the third and fourth orders.

There are many problems with all of this, not the least of which is that we don’t know why there would be a fifth order of natural phenomenon (other than the age of the universe) any more than we know why or how there is or needed to be a second, third, and fourth order of natural phenomenon. Is it connected to the expansion of the universe, which is now, since the 1990s, thought to be accelerating? And it is only by identifying the structural orders of phenomenon that we know, were we able to imagine the concepts that we call ‘genesis’ to link them, e.g., abiogenesis is accepted because there is currently no better theory of the origin of life, and because we have developed evidence of how it might have occurred.

- ✓ Regardless of what you think of my (crackpot) ideas, here is the one undeniable of the Anthropic Principle and the whole concept of cosmic evolution: There is something

in the universe which drives it toward localized low-entropic states (e.g., life, stars, planets, the super-organic) – *which we have historically personified and deified as creator, supreme being, spirits, in our own petty image* – in opposition to the predicted high-entropy end of the universe. The entire struggle of religion, science and human meaning, is to explain localized low-entropic states (mainly us); GGDM calls these Constructural Elements. This is perhaps implicitly recognized in the concept of the Boltzmann Brain. This has become an unstated axiom of modern science. Boltzmann really only described half the phenomena; he explained mainly high entropy states, but not the apparent predilection toward opposite low-entropy states.

- The Camus Test: So is the fifth order of natural phenomenon a form of Camus’ “philosophical suicide”?
  - ✓ “From this point of departure he proceeds to his critique of the different ways of ‘philosophical suicide,’ which he characterizes as so many ways of speculative evasion. All existential thinkers quoted by Camus have realized the futility of reason, all them are seen to have recourse to some transcendent entity as *raison d’être*: Husserl to his ‘extratemporal essences’ of innumerable phenomena, Chestov and Kierkegaard to a deity whose loftiness consists precisely of His incomprehensibility, indeed in His inconsistency, arbitrariness, inhumanity. Chestov is quoted as saying: ‘We address ourselves to God only to obtain the impossible; as to the possible, humans suffice.’ Such deity, to Camus, shows all the features of the absurd; He demands, in the old way, the *sacrificium intellectus*. In point of fact, it could be said that Tertullian’s *credo quia absurdum* has arrived, in the modern situation, at a *vivo quia absurdum*. ... Camus rejects the ‘philosophical suicide’; he refuses to accept any transcendent ... but seeks to remain within the pale of this world and to maintain himself on his scarce certitudes. He likewise discards ... physical suicide, because this also, in its ultimate consequence, resolves, dissolves the absurd, implying acceptance. ‘The point is, to die irreconciled and not of one’s own accord.’” – Erich Kahler, The Tower and the Abyss (1957) (emphasis in original) (available free on Google Books).

On the one hand, I have not offered any “transcendent entity” or supreme substances to explain the absurdity of the universe. I have not said this is beyond what is rational to humanity, I have not demanded *sacrificium intellectus* to embrace the idea of a fifth order – I have not said, ‘you just have to believe and it will be true’ nor have I offered any vision or promise of an afterlife – but have instead, reasoned the existence of a fifth order of natural phenomenon, from the *a priori* base of what we knew in the early 20<sup>th</sup> Century, that is beyond ours, and incommensurable with ours. See *Not Quite A Priori*, 2 Culture, p. 373, *supra*. But I have cautiously gone a bit past the “pale of this world” and the “scarce certitudes” of Camus.

- ✓ Because of the success of calculus in solving previously impossible problems (see calculus discussion, 1 Entropy, p. 221, *supra*), there seems an idea that a new math will explain quantum phenomenon. In this sense, has math become the “extratemporal essences” (*ut supra*) and the “philosophical suicide” of empirical science? There is a colorable argument in the way that mathematics and math solutions are spoken of in breathless, glowing terms as *the* universal truth and understanding (all others being inferior, fuzzy or untrue because they cannot be mathematically proven); I would not be the first to suggest that math has become the mysticism of science.

*“To get from Aristotle to Newton, you have to be able to imagine a world without friction. Luckily, that isn’t so hard; if you’ve ever played air hockey or laced up ice skates, you can vouch for Newton’s first law. But what is the quantum equivalent of an air hockey table – an everyday object that provides us hands-on access to quantum physics? If there is one, I haven’t thought of it.” – Kate Becker, “Is Quantum Intuition Possible?” NOVA, July 28, 2014*

**When the Thames Froze Over:** The “world without friction” turned out to be space; Newton, who lived during the Little Ice Age and whom we believe was never in space, imagined it nonetheless. Maybe he observed ice skating or fell on his butt in the winter (makes more intuitive sense than the falling apple story); the Thames River froze over many times during his life (the Little Ice Age), three times the ice was thick enough that they held a fair on it.

- ✓ Again, I cannot help but to recall the extradimensional toy box from “Mimsy were the Borogoves” (1943) by Lewis Padgett (a pseudonym of American writers Henry Kuttner and C. L. Moore). Science has again caught up to science-fiction imaginations; from the toys in the strange box the children gained an intuitive understanding of another math or physics. This is what Ms. Becker now seeks to intuitively grasp quantum physics.

*[Interview] “[Enrico] Fermi would come down in the afternoons, he was busy in the mornings with the more serious affairs of bomb design, but then the HYPO was his plaything, so he would come down after lunch, call us in all around and say ‘what do we do today’? And then he would answer his own question because he knew exactly what he wanted to do. ... It was a very meaningful learning process for me because he had almost phenomenal intuition for what things ought to be. If the answers didn’t come up the way he thought they should be, then he’d patiently go back and repeat the experiment and he was usually right. It was very interesting to work with him.”*

– Dr. Schreiber (audio), 1993 Voices of the Manhattan Project by Richard Rhodes

**Frame It:** It has become increasingly clear (from what I have read) that in the last decades many think the problem with quantum physics is that we may be asking the questions in the wrong frame of reference.

It seems possible, even probable to me that even though the science of quantum physics is that of the first order of natural phenomenon, the quantum understanding may be that it is part of the fifth order of natural phenomenon that we have not yet fully understood or even outlined (and predictably we continue to try to find the answers in the first order sciences). This would explain the frame of reference issue in quantum physics – that physicist are expecting the answer to the quantum riddles to be discoverable in line with existing first order phenomenon knowledge (of which they are the dominant sages in the sacred groves) – and would be possibly a transformative understanding for humanity, the first time we have understood anything beyond ourselves:

- ✓ It is notable that all four of the orders of natural phenomenon identified by Mr. Case fall within the realm of what we know and what was known at the beginning of the

20<sup>th</sup> Century. Thus, all of the orders of natural phenomenon identified and studied so far, are either ‘below’ ours (in the fact flow sense described above) or are ourselves in the sense of the third and fourth order of natural phenomenon (perhaps this is a bit human-centric? Did Mr. Case replace the geocentric universe with a teleological human-centric universe of four natural orders culminating in us?). If indeed we are currently at the edge of recognizing a fifth order of natural phenomenon, it would be the first time in human history where we recognized a natural order beyond ourselves.

- ✓ If you assume that Mr. Case is ‘correct’ or presents at least a colorable framework (noting that his intent was to define sociology within the spectrum of human knowledge) wouldn’t it be interesting if we had the framework to understand all along, but that it was ignored because the originator was a somewhat obscure early 20<sup>th</sup> Century sociologist (just as GGDM will be dismissed for much the same sort of reason, in addition to the fact that it’s another silly space game and we prefer looking down instead of up)? What of value does sociology have to say to physics or biology? When sociology was not then considered a science but a philosophy branch (Mr. Case’s introduction provides valuable firsthand historical material) and is barely recognized without ‘sniffiness’ as an equal in the sciences even now?

---

*“Vitalism is the belief that ‘living organisms are fundamentally different from non-living entities because they contain some non-physical element or are governed by different principles than are inanimate things. Where vitalism explicitly invokes a vital principle, that element is often referred to as the ‘vital spark,’ ‘energy’ or ‘élan vital,’ which some equate with the soul.*

*In the 18<sup>th</sup> and 19<sup>th</sup> centuries vitalism was discussed among biologists, between those who felt that the known mechanics of physics would eventually explain the difference between life and non-life and vitalists who argued that the processes of life could not be reduced to a mechanistic process. Some vitalist biologists proposed testable hypotheses meant to show inadequacies with mechanistic explanations, but these experiments failed to provide support for vitalism. Biologists now consider vitalism in this sense to have been refuted by empirical evidence, and hence regard it as a superseded scientific theory.”*

– from Wikipedia article, “Vitalism,” citing to [Routledge Encyclopedia of Philosophy](#) and to Elizabeth Ann Williams (2003)

---

**Carbon Chauvinist:** Vitalism may have been in the background of Mr. Case’s division of the first and second orders of natural phenomenon, which he called “the inorganic” and “the vital organic” (*ut supra*) – notice the word ‘vital’ – in 1924. However, it was not his purpose in the introduction to a sociology book to argue vitalism or perhaps what is now called abiogenesis, just as I have declared in 1 Fallen to Earth, *infra*, that I am not interested in arguing about whether or not there is a God (i.e. supreme being) because it is irrelevant to my purposes in GGDM. That aside, the divisions of orders of natural phenomenon provided by Mr. Case are intuitive and axiomatic, and can be readily observed and accepted without recourse to arguments about vitalism, souls, animating forces or whatever; anyone can see that there is something different between a living creature and a rock (except in the case of some humans ☺); Star Trek liked living rocks.

- ✓ Violation of the natural boundaries between the living and the non-living, whether it be rocks or corpses, is the bedding on which much of horror is constructed, and occasionally, clever fantasy novel endings.<sup>10</sup>

I believe that my first exposure to the term “gestalt” came when I was working on some project at the newly-opened Library Center of Point Park College. I cannot remember what I was doing exactly, but I think I had out a volume of the Encyclopedia of Philosophy. Therein I read an article which contained a short description of a conversation of early 20<sup>th</sup> Century biologists sitting around a stove. One of them (I remember the name Wolfgang) pointed out that if we had all of the chemicals of the human body, in the correct amounts, we could not either create a human body or create life. The conclusion was that the human body (and life) must be something more than the pile of chemicals that we know it contains; there is something that makes the whole greater than the sum of its parts. I was very impressed with it, it stuck in my mind for over 25 years and probably started my thinking about some of what has been expressed in GGDM.

There is something in life that is not present in rocks and that is so axiomatic that the concept of persona, soul, etc. has sprung from this observation since at least late in the Paleolithic Age. At its root, vitalism is based on a common observation that is deducible from the experience of hundreds of generations of humanity on Earth, it is testable and repeatable, but we cannot make it so any more than we can make an earthquake or hurricane. However, where does one draw the line: Is vitalism or theology a mythopoeic explanation for what is commonly observed, e.g.:

- ✓ “Vitalism is that rejected tradition in biology which proposes that life is sustained and explained by an unmeasurable, intelligent force or energy. The supposed effects of vitalism are the manifestations of life itself, which in turn are the basis for inferring the concept in the first place. This circular reasoning offers pseudo-explanation, and may deceive us into believing we have explained some aspect of biology when in fact we have only labeled our ignorance.” *Id.*, quoting Joseph C. Keating, Jr.<sup>11</sup>

Or is it simply deducible from what is commonly observed in the same way as an algebraic equation; that is, I saw two drunk men enter the bar just before last call, and ten drunks come out at closing time (and no one else entered or left, and all left at closing time), how many customers must have been in the bar when the last two entered? We have a rock, we have a living person, and we have a dead person; they do not have the same qualities, even if made of the same elements. What does the living person have that the rock never had and that the dead person has lost? There must be something different. Science has had similar problems, to wit:

- ✓ “On the other hand Titchener’s prediction – that, due to this irrelevance, introspective psychology would continue to flourish *alongside* behaviorism – with hindsight, seems a bit laughable itself. As Ryle puts it, ‘the extruded hero,’ consciousness, for scientific purposes, ‘soon came to seem so bloodless and spineless a being that even the opponents of these [behaviorist] theories began to feel shy of imposing heavy burdens upon his spectral shoulders’ (Ryle 1949: 328). Ryle’s countercomplaint still rings true today despite recent attempts to revive consciousness as a subject of serious scientific inquiry ... While it may be urged that the hero was never wholly extruded but has been lurking all along in the caves of psychophysics (e.g., in correlations of physical stimulus variations with *noticed* differences in *sensation*), recent attempts to extend this psychology-as-psychophysics approach beyond psychophysics remain nascent at best.” – Larry Hauser, “Behavioralism,” Internet Encyclopedia of Philosophy article, September 17, 2019 (emphasis in original).

While vitalism has been dismissed as a “superseded scientific theory” (*ut supra*) and has been savagely criticized as unfalsifiable,<sup>12</sup> theological, dogmatic, and pseudoscientific, it still hangs

around in the background because it has long been the assumption of humans that living things have something that makes them different from non-living things (this, long before Christianity), and second, that without achieving abiogenesis even once in the laboratory (and that's a scary thought by itself), the mechanistic side of the argument about the origin of life has also not made its case, has not closed the sale of reductionist physics as the explanation of living organisms. So some form of vitalism (by a different form or name) is still possible, biology is stuck with, and cannot shake off, vitalism at least in a metaphysical sense, and Carl Sagan seems to be addressing that argument in *Cosmos*, Ep. 5, adroitly dancing around it without directly mentioning it:

- ✓ “I am, reluctantly, a self-confessed carbon chauvinist. Carbon is abundant in the *Cosmos*. It makes marvelously complex molecules, good for life. I am also a water chauvinist. Water makes an ideal solvent system for organic chemistry to work in and stays liquid over a wide range of temperatures. ...

I am a collection of water, calcium and organic molecules called Carl Sagan. You are a collection of almost identical molecules with a different collective label. But is that all? Is there nothing in here but molecules? Some people find this idea somehow demeaning to human dignity. For myself, I find it elevating that our universe permits the evolution of molecular machines as intricate and subtle as we. But the essence of life is not so much the atoms and simple molecules that make us up as the way in which they are put together. ...

If we did not know better, we might be tempted to take all the atoms that make us up, mix them together in a big container and stir. We can do this as much as we want. But in the end all we have is a tedious mixture of atoms. ... we could not mix those chemicals together and have a human being emerge from the jar. That is far beyond our capability and will probably be so for a very long period of time.”

Carl Sagan was very probably aware of and well-versed in ‘emergentism’ as a scientific theory, which some shade or lump with biological vitalism. Video is available on YouTube.

---

*“Lead the people with administrative injunctions and put them in their place with penal law, and they will avoid punishments but will be without a sense of shame. Lead them with excellence and put them in their place through roles and rituals, and in addition to developing a sense of shame, they will order themselves harmoniously.”*

– Confucius, *Analects II, 3*

## Endnotes.

<sup>1</sup> Commentary & Citation: I have attended the Shen Yun show twice in 2016 and 2018. I remember being delighted – it is a fantastically talented act – but I also remember being annoyed at the *dues ex machina*. Other times, I said, that’s how stories were told in that culture, and should be accepted as representative. Some had less kind reactions:

- ✓ “Some people who go to the show complain they didn’t know what they were in for. Because nowhere in the effusive advertisements is it mentioned that Shen Yun has a political bent. Shen Yun translates to ‘divine rhythm,’ and according to the show’s website, the artists who put on Shen Yun practice Falun Gong, also known as Falun Dafa, a belief system that encompasses meditation, tai chi-type exercises, and ‘strict

morality’ (smoking, alcohol, and extramarital or same-sex sexual relations go against the teachings).” – Alix Martichoux, “You’ve seen the ads. But what’s the deal with Shen Yun?” SF Gate, February 6, 2019.

- ✓ “Many people posting reviews on Yelp weren’t as eloquent. ‘Be warned: Religious sermon!’ reads a Yelp review from someone who saw the show in Fresno. ‘I WALKED OUT as soon as anti-evolution statements were made on the screen. False advertising!’ ‘I rate this a Zero star. This show is purely CULT PROPAGANDA. Do not waste your money and time for this,’ said Ron F. from Pittsburg, Calif.” *Id.*, CAPS IN ORIGINAL.
- ✓ “The Chinese government is not a fan either. The practice of Falun Gong is forbidden in China and its members are routinely persecuted. In condemning the ‘so-called ‘Shen Yun’ performance, the embassy’s website calls Falun Gong a ‘...cult that seriously harms the society and violates human rights, and is a cancer in the body of the modern and civilized society.’” *Id.*
- ✓ “The Guardian reports ‘there’s no evidence of the kind of coercive control that the [cult] label suggests.’ Besides, it’s not like the Chinese government has a stellar human rights record. According to Shen Yun’s website, many of the dance company’s members were persecuted and tortured for practicing Falun Gong in China.” *Id.*

<sup>2</sup> Commentary & Citation: This theme was revisited in The Dark Crystal: Age of Resistance series (2019): Are the Skeksis ‘evil’ because they feed on the essences of other species?

- ✓ Before this, Stargate Atlantis explored the idea via the Wraiths; though natural enemies of everything they can feed on, are they ‘evil’: “The Wraith too feed on humans, treating them akin to livestock and regarding the act of feeding as nothing more than natural predation.” – from Wikipedia article, “Wraith (Stargate).”
- ✓ If the Wraiths are evil because they keep humans as livestock to feed, then the concept of evil is demonstrably a *subjective* human one and *not a universal or objective* concept like the theologians have been arguing for two millennia. To cows and pigs we are evil, but theologians insist that they cannot know that concept.
- ✓ It is thus at the end of the Twilight Zone episode, “To Serve Man” (1962), Chambers looks into the camera and asks: “How about you? You still on Earth, or on the ship with me? Really doesn’t make very much difference, because sooner or later, all of us will be on the menu... all of us.”

<sup>3</sup> Commentary & Citation: Here is the odd thing. Although Joseph Lancaster and his system publicly rejected corporal punishment of students (however, it was learned later that Joseph Lancaster secretly beat several boys), apparently the practitioners became quite creative in finding new punishments. Thus, freed from the non-thinking traditional, accepted school punishment, they devised new punishments that may have been worse:

- ✓ “The poet Robert Southey noted that, despite his opposition to corporal punishment, he would rather be beaten than subjected to Lancasterian discipline” (Wikipedia, *ut infra*).

Information from Wikipedia article, “Joseph Lancaster,” May 31, 2019, some citing to Pen Vogler: “The Poor Child’s Friend,” History Today, February 2015, pp. 4-5, free at <https://www.historytoday.com/poor-child's-friend>.

- ✓ Whether it is true or not, whether or not there is evidence that he beat several boys for amusement, the fact that it is repeated in publication now speaks to the public perception of the Lancasterian system. I would assume that Ms. Vogler had sufficient sources to make that scandalous claim. The utilitarian-based Lancasterian system certainly had enemies and rivals who may have published such claims at the time, contrast for example, with the concurrent Swiss Romanticism inspired system of Johann Heinrich Pestalozzi: Mexico replaced the Lancasterian system in 1890 with the Pestalozzian system of education.

This educational discipline, especially methods of peer humiliation, and English class division conformity, along with overbearing post-WWII parenting, through the eyes of a child, is reflected in Pink Floyd’s The Wall (1979).

- ✓ See context discussion, Wall of Understanding, 2 Dreamtime, p. 152, *supra*.
- ✓ The military, who still uses a Lancastrian system in basic training of recruits has slowly eliminated corporal punishment, but has substituted other creative punishments in boot camp (e.g., the sand pit, or holding out your rifle or canteens at arms-length for extended periods of time, peer humiliation, physical exertion on the ‘quarterdeck’ and of course, the classic “do pushups until I get tired of watching you”).
  - See Gradgrind discussion, 1 Colleges, p. 463, *supra*.

<sup>4</sup> Commentary: The problem with Ma Barker is this: Despite the fact that the FBI tried to frame her as a criminal mastermind of the gang, which she very likely was not, to justify her death during the final shootout, she is not a sympathetic character or innocent bystander: Her sons were thugs, kidnappers, thieves, and murderers, and whatever blame attaches to a parent for the actions of their adult children after they are loosed upon the world, attaches 1 Order – Entropy & Evolution

especially to her; additionally, she probably knew some of what they had done, probably consciously provided social cover for them, and benefited from it, at the very same time that she was also hostage to the situation she helped create. She may also have been aware or suspected that her sons and their accomplices killed her live-in lover.

- ✓ As to who killed Ma Barker, we will never know because the forensic evidence was not preserved or analyzed as we do now; so a historical drama writer can make whatever ending is suitable; there are two branches, either she fired at the FBI from a window or she didn't, and either she was shot by the FBI or she was shot by her son for bringing the FBI to the house or to avoid capture.

<sup>5</sup> Commentary: If you wanted to create a truly 'evil' alien intelligence, this is your framework. This describes fairly well the 'bad guys' in almost every work of fiction and history. What was the thought process of each *individual* Mongol warrior or Crusader when they were massacring, torturing, raping people and burning and pillaging cities?

<sup>6</sup> Commentary & Citation: In The BeastMaster television series, the Sorceress turned the Beast Master's two ferret pets into humans so that she could interrogate them. All they wanted to do was look for food, and they kept talking about looking for food, she didn't get much out of them because they didn't know anything but looking for food. In the animated movie Ice Age 2 (2006), they made the mistake of asking what vultures think about...

<sup>7</sup> Citation: See 2 Culture, EN 10, pp. 376-377, *supra*, for full quote.

<sup>8</sup> Citation: Merriam-Webster online dictionary does not have an entry for "noogenesis" but does have an entry for the related term, "noosphere" (first use, 1930). However, Wikipedia has an article on the subject, which states, "Noogenesis was first mentioned in the posthumously published in 1955 book The Phenomenon of Man by Pierre Teilhard de Chardin, an anthropologist and philosopher, in a few places," followed by a paragraph from the book. Pierre Teilhard de Chardin also invented the term noosphere which, according to Wikipedia article "Noosphere," was published in his 1922 book Cosmogogenesis (meaning that Merriam-Webster is wrong on the first use).

- ✓ All of this traces back to a Soviet mineralogist and geochemist, Vladimir Vernadsky, who was born and raised in the Russian Empire of the late 19<sup>th</sup> Century (d. 1945), and likely was exposed to Russian Cosmism of that time. He in turn, popularized in his 1926 book, the term "biosphere," coined by the English-Austrian (Saxon) geologist of the Alps, Eduard Suess in 1885.

<sup>9</sup> Commentary: Sometimes, I get the feeling of a circle closing, of things 'coming round'; the title of this work has not changed since 2006-2007 (about 13 years now) and that was only to add the second part, Day Million to Gestalt Genesis (I remember a specific conversation related to this). Gestalt Genesis has been in the title since about the turn of the millennia, about 18-19 years as of 2019. The preceding section was not written to provide justification for the title, I was simply following the logic process of the argument. It just happened to work out cutesy. I am not playing any drama game, but perhaps humans have a "weird circle fixation" (Steven Strogatz, "Why Pi Matters," excerpt, The Big Bang, *supra*), a 'pre-destiny' or 'predilection' to seeing circles connecting our lives, and sometimes (like conspiracy theories), it is actually true. Is drama imitating life or imitating how we think life is?

- ✓ It has been about 30 years, give or take a year, since I rescued the Clarence Marsh Case book from the garbage pile in the rain in the alley behind the museum; I believe I might have read the intro or parts of it, sometime in the past, but the orders of natural phenomena didn't click with me until much later. From there, exposure to genesis studies terminology via the internet in 2017-2019 synthesized the argument.
- ✓ Without the book dating from 1924, I may never have heard of the 'order of natural phenomena' as the idea does not seem to be on the internet currently and I have not seen it elsewhere in any book. Matter-of-factly stated, that is all that can be said, the rest is an interpretation.

<sup>10</sup> Commentary: The cleverest use of the dead in fantasy – sorry Mr. Tolkien – was Stephen R. Donaldson's Second Chronicles of Thomas Covenant. Because Lord Foul had tricked Covenant (or maybe Covenant is just a fool) into breaking the barrier between the living and the dead by calling forth a long-dead, ancient hero, Lord Foul was unable to kill Thomas Covenant in the end (White Gold Wielder, (1983)). By comparison, Tolkien's Army of the Dead arriving just in time at the Battle of Plennor Fields (at least in the movie) where they swept over the bad guys feels a bit contrived, if naturally satisfactory as an ending to the dramatic battle.

<sup>11</sup> Citation: The Wikipedia article cites to: Keating, Joseph C. (2002), "The Meanings of Innate," The Journal of the Canadian Chiropractic Association, 46 (1): 4–10, PMC 2505097.

<sup>12</sup> Commentary & Citation: However, falsifiability is very slowly losing ground in science, see FOURTH DEGREE OF SEPARATION, 3 Fallen to Earth, p. 1543-1544, *infra*. What does this mean for vitalism? For GGDM?

*“To rule means to exercise power, and only he who possesses power can exercise it. This direct connection of power and rule forms the fundamental truth of all politics and the key to all history.” – Ludwig August von Rochau*

**Ambient Noise:** Those who are powerless (or feel they are) are just griping cynically in the background of our civilization. The extent to which this is true and the form(s) it takes (e.g., agitation, inactive Constructural Elements in GGDM) is the measure of political stability.<sup>1</sup>

**Capital Colony:** Each position which owns any colonized planet must have a capital. The Homeworld or a starting colony, or the first planet colonized by the position in the game automatically becomes the position’s Capital Colony; no Power activation is required. The capital is the source of remote authority, it is the central seat of the government, the administrative center, it is part of the identity of the population, and the emotional heart of the civilization.

- ✓ A Capital Colony is not a ‘specialized colony’ (see 4 Expansion, p. 925, *infra*) and a colony hosting the Capital receives no particular benefit; it does not require a Writ.
- ✓ A Homeworld has no distinction in game terms, it is considered a colonized planet. Thus positions that begin with a Homeworld must have it as their Capital Colony.

The first colony founded by Invader Primal State positions **must be** accompanied by a News Event declaring the location and Capital Colony status of the first colony. The Capital Colony of Homeworld and Lost Colony Primal States is already known at the beginning of the game, Outposters must announce their Capital Colony before the game begins.

Does the Capital Colony have a capital city? The game does not look at planetary surface details, but it should not be assumed that all Capital Colonies are like Isaac Asimov’s Trantor.

- **Capital Punishment:** The existence of a Capital Colony for each position is the normal assumption underlying the rules of this game. There is no extra benefit to having a Capital Colony, but that it allows positions to efficiently activate powers and direct the activities which are the result of the position’s Power Activations each turn (and do the things positions do in the game). On that basis then, it is the loss of the Capital Colony to conquest or destruction that has a special effect on the position: The loss of the Capital Colony results *in the disruption of the position’s Structural Government Title* (see World Powers Fall, 3 Government Titles, p. 616 and A House Divided, 5 Government Titles, p. 637, *infra*) and the position will also lose Acts or Scenes on the next turns as a result of government disruptions. Finally, an Intervention Potential Plus will be generated due to the disruption in the administration and centralized control from the conquest or destruction of the Capital Colony.

An IP+ (Intervention Potential Plus) *is not* generated for disruption of a Structural Government Title, which has no Conflict Checks, it is not considered a Disruption Event at a colony and cannot affect Constructural Elements, see Rousing the Rabble, 2 Disruption, p. 271, *supra*. So the loss of the Capital Colony will only generate one IP+ unless it also causes an Estate or Social Government Title to become disrupted at the end of the Regular Turn.

- **Fist Fights in Parliament:** As mentioned in 2 Constructural Elements, the *Capital Status* of the Capital Colony is disrupted if the Symbolic Constructural Element on the colony is inactivated for any reason. This *does not mean* that the colony ceases to be a Capital Colony or that the position does not have a Capital Colony. Rather, the symbolic image of the Capital

Colony is tarnished, loses prestige, or disputed such that, in addition to the inhibitions that accompany an inactive symbolic Constructural Element (for example, if Diplomatic Spaces were attached to the Capital Colony), one Intervention Potential Plus is generated each turn the Symbolic Constructural Element is inactive at the Capital Colony. A Special Bulletin may also be published, at the discretion of the Concierge, relating to the image problems.<sup>2</sup>

- ✓ This rule only applies to Capital Colonies; no other colony's political status is affected by whether or not the Symbolic Constructural Element is inactive.
  - ✓ Disruption of the *Capital Status* of the Capital Colony does not cause the Structural Government Title to be disrupted, because it is still a Capital Colony.
- Capitol Declaration: Each position may only have one Capital Colony at any time. A position would only need to declare a Capital Colony if the previous one is lost to conquest or destruction. A new Capital Colony must be declared on the Regular Turn following the loss of the old Capital Colony. There are two ways that a new Capital Colony can be declared:
- ✓ The first, preferable way, would be by an activation of the Order Power for that purpose, which must be accompanied by a News Event announcing the location of the new Capital Colony. By activating the Order Power, the position may choose the location of the new Capital Colony and avoid additional entropy.
  - ✓ If the position does not have enough Acts and Scenes to activate the Order Power, or chooses not to do so (the position is not required to do this *even if it can*), then the Concierge will choose and declare a new Capital Colony for the position, generate the News Event (as a Special Bulletin), and act pursuant to *Gone with the Wind*, 1 Government Titles, p. 582, *infra*, to restore the position's disrupted Structural Government Title. The Concierge will not provide an advance consultation on where he might place the Capital Colony if the position chooses not to do it, or what might happen as a result.

The baseline rule is 'one Capital Colony at a time.' This is largely for game convenience and sanity. History certainly suggests that in some cases, e.g., Rome and Constantinople, a polity might have two capitals. We all know how that worked out. But it might be possible by use of Writs in GGDM for a very large position to have two Capital Colonies; it might also help to avoid extinction, as Constantinople outlasted Rome by a millennia.

- Inside the Hyperspace Bypass: A position may choose to voluntarily move their Capital Colony during any Regular Turn by activating the Order Power for that purpose, and issuing a News Event declaring the move and the name *and political status* of the new Capital Colony. While the loss of the Capital Colony has dire consequences, moving the Capital Colony does not always have to be in response to military threat; clever players may find a way to make the movement of the Capital Colony a beneficial event.
- ✓ In addition to the activation cost of the Order Power to move the Capital Colony, the movement also costs 10 RPs from the Treasury.
  - ✓ Finally, the Capital Colony is not moved on the Regular Turn the movement is declared, but instead, the colony designated as the new Capital Colony gains that status on the following Regular Turn Cycle (even if the position submits no Actions, no Order Power activation is required to complete the process).

Voluntary movement of the Capital Colony does not require movement of populations between the old and new Capital Colonies (though the Concierge may reject the target colony due to ineligibility, below, and either cancel the move or choose a new Capital Colony).

- ✓ Rome was not the capital of the Roman Empire from the 3<sup>rd</sup> Century A.D. Milan and Ravenna in northern Italy were the last two capitals of the Western Roman Empire (after Rome became indefensible), and Constantinople was made the capital of the Eastern Roman or Byzantine Empire. The places that became later capitals of the Roman entities quickly grew in size, wealth, and importance, and later served as natural capital cities of other states (and religious and cultural centers) after the Romans.
- ✓ The Persian Empire had several palaces: Darius I built two massive palaces and frequently traveled through the empire, visiting local satraps or leading armies on campaigns. His personal guard, officials, supplies and servants formed a massive caravan. Although expensive, there were some political, military and administrative benefits to this arrangement, and the Persian Empire could easily afford the cost.

Though the Capital status of a colony is not technically an installation or enhancement, in some senses it can be treated as such, for example, that there is a Capitol sector on the colony planet which houses the buildings of government and probably a lot of secret stuff and very expensive equipment. Thus, it is then a target in Special Operations Black-ops (see 2 Special Operations, p. 1297 *et seq.*, *infra*) or Raids (see World in Flames, 4 Carriers & Fighters, p. 1083, *infra*) or Ground Combat (see 4 Combat generally), *infra*, which may be attacked and/or screened or protected as a target.

This process is designed to avoid disruption of the Structural Government Title due to not having a Capital Colony; when this process is followed, the position is not without a Capital Colony.

- ✓ “Although The Hitchhiker’s Guide fails to say whether Alpha Centauri’s planners used cost benefit analysis, they must have done. In all other respects, the practices of the Alpha Centauri planners and their earthling counterparts are identical. Throughout the Galaxy, it seems planners react to protesters in the path of their projects with the same dismissive irritation. Before energising the beams that vaporised Earth, the head of Vogon Constructor Fleet explained that: ‘all the planning charts and demolition orders have been on display in your local planning department in Alpha Centauri for fifty of your Earth years, so you’ve had plenty of time to lodge any formal complaint and it’s too late to start making a fuss about it now.’” – John Adams, “Vogon economics and the hyperspace by-pass – John Adams on a debate in which scientific uncertainty is being transformed into economic farce,” New Scientist, September 18, 1993 (reference to Douglas Adams’ Hitchhiker’s Guide to the Galaxy (1979)).
- Capital Eligibility: In any instance where the Capital Colony is either voluntarily or involuntarily moved, the new Capital Colony must be placed on a Friendly Colony within two turns’ ship movement of the old/current Capital Colony and the new Capital Colony must be connected so that it meets the requirements of the position’s Structural Government Title.
  - ✓ If there are no Friendly colonies available, then it may be placed on a Naturalized Colony, and if none are available, then it may be placed on a Converted Colony. As an absolute last resort, a Conquered Colony may serve as a Capital Colony.

- ✓ If the Capital Colony is not located on a Friendly or Naturalized Colony, then it must be moved to one as soon as one becomes available within two turns' movement range of the current colony.
- ✓ Placing the Capital Colony on a Conquered or Converted colony does not change the political status of the colony (*ut infra*).
- ✓ A Capital Colony is lost if located on a Conquered or Converted Colony that reverts.
  - See All Roads Lead To, 2 Government Titles, p. 595 *et seq.*, *infra*. As explained generally in the Government Titles rules, new Pathways will need to be formed on the Public Space, which may displace or cause loss of other objects and formations on the Public Space, so as to properly connect the new Capital Colony to the Government Titles.

There are no minimum population requirements for a colony to become a Capital Colony. Game mechanically, this is intended to insure ease of finding a new Capital Colony (and thus is a concession to playability); the only requirement is eligibility based on political status of the target colony. Realistically, consider that the number of people who live in most modern capitals and work in the national government offices there, is small in relation to the total population (e.g., about 250,000 or 7.56% of US government employees work in Washington, D.C. according to the city's Obama-era employment guide out of 300M U.S. population).

- Capitol Ships: GGDM makes no provisions for use of any sort of ship as the Capital of the position. It is not expressly disallowed, however, and may properly occur in the game possibly with the use of a Writ, one of the main issues being the required Pathways connecting the Capital to the Government Titles on the Public Space. Occasionally ships act as Capitals in space-opera fiction, in extreme circumstances, such as when a position has no ground colonies remaining (as in *Battlestar Galactica*). The space-adapted bioroid Abh race in *Crest of the Stars* and *Banner of the Stars* anime series, maintain an (apparently) immobile Imperial Palace in interstellar space which has grown into a vast fortified hub city (similar to *The Colony* in the later reimagined *Battlestar Galactica* series).
  - ✓ Even in science-fiction film where the sovereign person or group is shown on a ship, such as the Emperor on the Death Star in *Star Wars*, or the Minbari Gray Council on the dreadnought moving to First Contact with humanity, the position still has a large, urbanized Capital Colony on a planet (e.g., Coruscant in *Star Wars*), usually a Homeworld (e.g., Minbar in *Babylon 5*). The drawbacks to using a ship as the Capital of a position are obvious; as Robert Heinlein said in 1940, "Blowups Happen."
  - ✓ I do not believe it has ever occurred historically to any sovereign, though it is possible that it occurred in situations such as Ching Shih (the 'Pirate Queen') or William II de La Marck (admiral of the Sea Beggars) where a large non-sovereign or nationalist political organization was commanded from ship.
- General Howe in Philadelphia: If the original Capital Colony is conquered or destroyed before the transfer at the end of the Regular Turn, the position will not have a Capital Colony at the end of the Regular Turn, and the Structural Title will automatically be Disrupted, and then restored at the end of the next turn if the new Capital Colony survives.
  - ✓ If the movement of the Capital Colony is in progress, and the colony designated as the new Capital Colony is captured or destroyed before it becomes the Capital Col-

- ony, the movement of the Capital Colony is cancelled, and the old Capital Colony remains the Capital Colony. The 10 RPs are always subtracted from the Treasury in any case. A News Event will be required to announce the cancellation.
- ✓ If the movement of the Capital Colony is in progress and both the old Capital Colony and the colony designated as the new Capital Colony are captured or destroyed at the same time – well, do you still deny the universe is conspiring against you? – the position will obviously suffer the effects of being without a Capital Colony.
  - ✓ [Interview] “What is left for the Confederacy once they have lost Atlanta and Richmond, and Mobile, Alabama, and Nashville, Tennessee? What is left for the Confederacy? You can move the capital wherever you like. If the economic heart of the Confederacy is gone, then all you become is a rabble of rebels. So, once the 1864 election is over, Lincoln is still in power. Lincoln is determined to prosecute the war, and there is nothing that Robert Lee can do to win.” – Dr. Aryeh Nusbacher (Instructor at Sandhurst), Under Siege television series, Episode 3 (documentary, 2008).
    - This is a great example of the interaction of politics (the 1864 election) and military situation (the siege of St. Petersburg and Richmond).

---

*“There are alligators in the swamp who are more mannerly than a few members of the criminal defense bar in Chicago.” – Scott Turow, One L (1977)*

---

**Moving the Swamp:** Imagine that a President-elect who was born, raised, and lives in Chicago refused to move into residence at the White House. Despite the immeasurable symbolic power and convenience of being *the* resident of the White House, and intensely indignant media backlash, the President remains at his Chicago residence during the term in office, surrounded by extended family, friends, and loyal locals, and an army of Secret Service agents, arguing that Chicago is more representative of the United States than Washington, D.C., and more centrally located.

The most famous example of this type of situation is the 67-year period of the Avignon Papacy, where *seven French Popes* held court at the papal enclave of Avignon, France from 1309 to 1376, refusing to move to Rome.

But there is a stark difference between the two situations: The Pope is a monarch and his capital is wherever he holds court; whereas, only Congress can declare the capital of the United States and thus Chicago does not become the Capital of the United States by virtue of the residency of the President.

- **Capitalizing:** I seem to have acquired a habit of Capitalizing certain terms in GGDM (e.g. Original Populations, Colleges, Fundamental Realities, Concierge, Existential Void, etc.) as if to give them extra or official effect. Whatever the purpose of Capitalization (i.e. imposition of inequality, see Symbolic Constructural Element, 1 Constructural Elements, pp. 176-177, *supra*), it is quite likely that ggdm would be just as well without it. But I still want (as in mental comfort) to Capitalize game terms because I have been trained to think it Emphasizes their Importance:

- ✓ “[John] Hart recommended his readers to use a capital letter at the beginning of every sentence, proper name, and important common noun. By the 17<sup>th</sup> century, the practice had extended to titles (*Sir, Lady*), forms of address (*Father, Mistris*), and personified nouns (*Nature*). Emphasized words and phrases would also attract a capital. By the beginning of the 18<sup>th</sup> century, the influence of Continental books had caused this practice to be extended still further (e.g., to the names of the branches of knowledge), and it was not long before some writers began using a capital for any noun that they felt to be important. Books appeared in which all or most nouns were given an initial capital (as is done systematically in modern German) – perhaps for aesthetic reasons, or perhaps because printers were uncertain about which nouns to capitalize, and so capitalized them all.” – David Crystal, The Cambridge Encyclopedia of the English Language (1995), p. 67.<sup>3</sup>

✓ See also *Metaphysics of Presence*, 1 The Streams of Time, p. 74, *supra*.

The hollowness of this is revealed by the following admonishment from a federal judge:

- ✓ “Defendant ... is apparently a member of a group loosely styled ‘sovereign citizens.’ The Court has deduced this from a number of Defendant’s peculiar habits. First ... sovereign citizens are fascinated by capitalization. They appear to believe that capitalizing names have some sort of legal effect.... [Defendant] appears to believe that by capitalizing ‘United States,’ he is referring to a different entity than the federal government. For better or for worse, it’s the same country... The Court, therefore, feels some measure of responsibility to inform Defendant that all the fancy legal-sounding things he has read on the internet are make-believe ...”<sup>4</sup>

In fairness, the Court’s admonishment in this case was in regards to using ALL CAPS for certain words in legal pleadings, e.g., UNITED STATES instead of United States, as if they were different things, as if one was legitimate and the other, to which the Court belonged, was not. At least I haven’t done that yet. Yet.☺

---

*“Beware, lest in your anxiety to avoid war, you obtain a master.”*

– Demosthenes

---

**Glorious Revolution:** What is the difference between an invasion and a foreign coup? When was the last time England was invaded? The traditional answer is always 1066 A.D., the year of the Norman invasion by William I.

However, in 1688 the Protestant stadholder of the Netherlands, Prince William of Orange sailed a Dutch fleet to England (*after* receiving an invitation and assurances from dissident elements) with an expeditionary force (i.e. invasion) of 463 ships and 40,000 men (of which 15,000 were land troops), and assumed the throne of England as William III, unseating his *father-in-law*, the Catholic King James II, the brother of Charles II, who was restored after Oliver Cromwell died and his son abdicated. William III’s efforts – The Glorious Revolution of 1688 – were assisted by high level defections from James II’s court – especially Lord Churchill and James II’s own daughter, Anne, who later became Queen of England in 1702 after William III died, and Queen of Great Britain in 1707 after the Acts of Union (possibly related to the failure of the Darien Scheme discussed in 4 Taxation & Census, p. 329, *supra*, and 3 Expansion, p. 911, *infra*).

- ✓ Queen Anne died in 1714, having outlived all of her three children (plus five stillborn and seven miscarriages), and by the Parliamentary Act of Settlement of 1701, German-speaking George, Prince-Elector of Hanover, was crowned George I, King of England.
- ✓ The point of the Glorious Revolution was that for the first time in history, Parliament decided who would be the next monarch of England. George of Hanover agreed that British troops would not be used in conflicts or dynastic disputes involving Hanover. England and Hanover had to be ruled as separate sovereigns by the same person.
- ✓ As a result of dynastic marriages and religious conflict, England (and Great Britain) did not have a native monarch – some didn't speak English – after 1688. There were protests about George's coronation in 1714-1715, much of it associated with Henry Sacheverell, the firebrand High Anglican priest and darling of the Tories, whose lavishly fêted progress through England led in part to the Riot Act of 1714.

---

*“The heaviest penalty for declining to rule is to be ruled by someone inferior to yourself.” – Plato, The Republic (381 B.C.)*

---

**Choosing Not to Vote:** Similarly in choosing not to vote, one has chosen to let others choose for them. There is a cost even to *the third alternative*, avoiding voting either for the lesser evil or the greater good by not voting.

- ✓ ‘Not to speak is to speak. Not to act is to act’ – quote of unknown origin frequently misattributed to Dietrich Bonhoeffer on Twitter and the internet. But still true.<sup>5</sup> And it certainly seems like something he might have said if he'd thought of it.

Each time you choose not to vote, you make the votes of all those who did incrementally more powerful and influential on the outcome. If there are five voters, each has a 20% say in the outcome, but if one doesn't vote, each of the remaining four voters has a 25% say in the outcome. You are helping those whom you might disagree with get their way in the election. If there are three candidates, one of whom you dislike, that candidate wins with two votes of only four voted if the other two voted for the other two candidates. Whereas if you had voted for your candidate, it would have at least been a tie if the other voter didn't switch his vote.

- ✓ This issue in GGDM directly relates to end game procedures, see It was the End of History, 1 Resolution, p. 1456, *infra*.

**Colony Politics:** Colonies have four possible *political status* which govern their relationships. Colonies can be Friendly, Conquered, Converted, or Naturalized.

- **Identity Politics:** This is the area of identity politics; *us and them*, stories and circumstances can develop where some factions of the population could be more friendly and loyal to aliens, or to alien ideals, than they are to their own government. But in most cases, it can be assumed that populations prefer the company of their own kind and to be ruled by their own government, even if they radically oppose those currently holding power or yearn for independence from the interstellar or planetary governments.
  - ✓ “Perhaps it is time that we start to look to politics with a new approach. What did we learn from the last few years' elections? That people are aligning themselves under a new paradigm, which is not political in the sense we have used until now: it is called

IDENTITY. Voters now elect those with whom they identify, and support them because in fact they defend their identity, no matter what. They do not listen to contradictory information, which they dismiss as ‘fake news.’” – Robert Savio, “The Unnoticed Demise of Democracy,” Inter Press Service (IPS) News Agency, July 24, 2017 (emphasis in original).

- Friendly Colony: Friendly colonies are colonies composed of their owner’s Native Population Type, descended from the Original Populations. Friendly colonies are assumed to be completely loyal *for game purposes*,<sup>6</sup> support the operation of fleets, and produce and grow at full potential, and may also be the site of Colleges and Institutes.
- Conquered Colony: When a Colony and/or Ground Combat ends with the surrender of the colony, the colony has no choice but to hope for the best.<sup>7</sup> At that point, the colony becomes a Conquered Colony controlled by the attacker and passes to their possession; the former owner exerts no control over the colony and *may not exercise Taxation or Census Powers*.
  - ✓ See Over My Dead Body, 5 Combat, p. 1011, *infra*, for colony surrender discussion.
  - ✓ The newly Conquered Colony is removed from its previous owner’s Public Space and placed on the new ruler’s Public Space and connected subject to the Structural Government Title requirements.
 

The Monad occupied by the colony is not transferred with the colony (see Monad Imperialism, 3 Order, p. 561, *infra*), it remains available (but now unoccupied) in the original owner’s Public Space. Thus, conquest of colonies is *not* a means to expand the conqueror’s Public Space, but rather, will serve to fill the conqueror’s Public Space with **alien colonies** while expanding their sphere or footprint in Galactic Space. However, see Alienation and Alien Nation, 3 Order, pp. 560-561, and In Spite of Ourselves, 4 Order, p. 574, *infra*.
  - ✓ A Conquered Colony is *not* a Friendly Colony for the new owner and may not be used to support fleets (see Supporting Colony, 1 Movement, p. 840, *infra*) and may not be taxed (see The Taxman Cometh, 2 Taxation & Census, p. 306, *supra*) but may be Looted (see 3 Commerce, p. 1210, *infra*).
  - ✓ Further, the Conquered Colony will instantly *revert* to the control of the *owner of the Native Population Type* of the colony at any time the conqueror has no warships remaining in the system, or ground troops on the colony, regardless of whether or not the previous owner was the position representing the Native Population Type of the colony. However, if the colony was Naturalized by its previous owner, *it may first revert automatically to the previous owner and not to the owner of the colony’s Native Population Type* (this is a political situation on the ground subject to possible Concierge Interventions). The Concierge will make an of-the-moment judgment.
- Converted Colony: The Germans were welcomed as liberators by Ukrainian nationalists, the Japanese were similarly welcomed in French Indochina. For a month. The hopes of the French Revolution were carried to the subject masses across Europe on the point of bayonets:
  - ✓ “‘We come to give you liberty and equality,’ growled old Marshal Lefebre in a Franconian town. ‘But don’t lose your heads about it – the first person who stirs without my permission will be shot!’” – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 509.

Although the Philippines eventually were granted independence, the United States was not a great custodian; we did a lot of damage in the meantime, and it was not lost on intellectuals or the public that in 1899 we had put ourselves in the same position as the hated British in 1775. And for the Philippine Republic, they had simply traded the Spanish yoke for the American yoke. It was thus that by stages in 1902, 1916, and 1934, Congress passed legislation granting the Philippines increasing autonomy and a timeline to independence.

- ✓ Although the Okinawans have long resented Japanese rule, the United States was not welcomed as liberators. They would like us to leave too.

In order to make a Conquered Colony productive, it must be pacified, order must be restored, and the colony must be brought into the conqueror's economic system.<sup>8</sup> This is the process called Conversion ('annexation without representation'), and there are two ways to convert a conquered colony, the long way and the short way:

- ✓ The short way is by either Orbital Bombardment or Pacification Combat (see Making War for Peace, 6 Combat, p. 1020, *infra*), both lasting one Combat Round, following the conquest of the colony, and will result in damage to the colony and the planet.
- ✓ The long way requires activation of the Order Power to attempt Conversion.

A Converted Colony will produce resources during Taxation by the new owner, will support the Operational Flight or Supply of fleets, and may build and do everything a Friendly Colony can, but the populations on Converted Colonies *do not grow* when the new owner's Census Power is activated and it will revert in the same manner as a Conquered Colony any time that the owner does not have a warship in the system and/or ground troops on the colony.

- ✓ Conversion also happens to be – not coincidentally – a legal term for certain similar acts that commonly amount to stealing. As used in this game, 'Conversion' of a colony refers mainly to the problematical transfer of acceptance of legitimate authority over a colony and/or transfer of acceptance of remote authority by the colony government and/or population. It is used mainly in the Roman Empire sense of obtaining long-term legitimate authority of conquered areas, while leaving local beliefs intact.
  - ✓ The term, as used in this game, also refers in part to the legal definition of civil conversion, which is a voluntary possession by one person inconsistent with the ownership rights of another. Conversion of a colony may also, but does not necessarily, imply forced religious conversion, forced change of social beliefs and morals, forced rearrangement of social and political structures, suppression of insurgencies, predatory business practices, enslavement of all or part of the population, winning hearts and minds, and/or co-opting and enrichment of local magnates depending on the story.
- Naturalized Colony: Sometimes called a 'domesticated pet colony,' the Naturalized Colony is a Converted Colony that has been in the possession of its current owner so long that it becomes completely friendly (or *mostly harmless*) and culturally corrupted (well, that's one side anyway) so that the colony becomes in all ways equal to a Friendly Colony, meaning that the population will grow during Census, it will produce Taxation and support the Operational Flight or Supply Limits of starships, and it does not require a warship or Ground Units present to insure loyalty. The only difference remaining between the Naturalized Colony and the Friendly Colony is the Native Population Type of the colony. A Naturalized Colony that is subsequently captured by any other player, including the owner of its Native Population

Type, becomes a Conquered Colony again, but if the owner for whom it was *last* Naturalized recaptures the colony, it immediately reverts to being a Naturalized Colony for that position.

- ✓ Fido (Latin, *to trust, believe, confide in*) as a generic, symbolic dog name originates as the name of Abe Lincoln’s favorite dog. Fido was the first presidential dog to be photographed, but had to remain in Springfield, IL when Mr. Lincoln moved to the Whitehouse. Fido was killed by a knife-wielding drunk man in 1866, the year following the assassination of President Lincoln. Though few have ever known a dog named Fido, the national attachment to President Lincoln’s legacy made the dog name symbolic of him. Information from Stanley Coren, “Why Are Dogs So Frequently Called ‘Fido’?” *Psychology Today*, October 12, 2011.
- **Balkanized Colony Planets:** For the purposes of the political status of Balkanized Colonies, each population type present on the planet is treated as a separate colony (even if the assumption is that the populations are intermingled). Thus, one part of the population might be a Friendly Colony while the remaining population constitutes a Conquered Colony.
 

This is far from unheard of in human history; consider the Jewish Ghettos of European cities, or Greek and Turkish sections of Cyprus, the Gaza Strip, or any form of segregated housing, employment, education, or areas designed to gain the skill and work value of minority populations while keeping them socially and physically separated from the majority and inferior.
- **Pilgrimage to Earth:** A Homeworld has no special game qualities or distinctions merely from being a Homeworld (other than sentimentality). A captured/conquered Homeworld becomes a Conquered Colony for the conqueror and is treated as a colony for all subsequent purposes.
  - ✓ “Of course! Earth is old, her minerals are gone and her fields are barren. Her colonies are independent now, and filled with sober folk such as yourselves, who want value for their goods. So what else can old Earth deal in, except the non-essentials that make life worth living?” – Robert Sheckley, “Pilgrimage to Earth” (1957).

---

**Governor Tarkin:** *The Imperial Senate will no longer be of any concern to us. I have just received word that the Emperor has dissolved the council permanently. The last remnants of the Old Republic have been swept away forever.*

**General Tagge:** *But that’s impossible! How will the Emperor maintain control without the bureaucracy?*

**Governor Tarkin:** *The regional governors now have direct control over their territories. Fear will keep the local systems in line. Fear of this battle station.*

– Star Wars, Episode IV, A New Hope (aka Star Wars, 1977)

---

**Green Zone:** The GGDM rules make the assumption – for game convenience – that fear of the return of conquering warships, orbital bombardment, and other reprisals, will be and are overcome by courage and the desire for freedom, thus allowing unguarded subjugated colonies to revert automatically.

Whether or not something like the Tarkin Doctrine might eventually keep Conquered or Converted Colonies from automatically reverting is a matter for the game story arc and the position players; it is not an assumption made in the game rules. Certainly, however, if the subjugated

colonies are to be kept in line by fear of planetary destruction, the conqueror will not keep Ground Units, or anything valuable, on the planet that might need to be destroyed.<sup>9</sup>

There is no set threshold for the size of the Ground Unit required to hold a Conquered or Converted Colony from reverting if no warships are present in the system. This is a gray area that could contemplate many factors, such as the hostility of the population (e.g., Insurgency levels resulting from Pacification Combat, see Fabrication of Order, 6 Combat, p. 1022, *infra*) and hostility of the Habitability Class of the planet to the occupying troops, the nature of the conquered native population type (culture and Fundamental Realities), time elapsed since conquest, actions of the conqueror, and so on.

It is certain that a small Ground Unit is more in danger of losing control of a colony than a larger one, and population to Ground Unit ratio is a good measure. Historically, occupiers who have lost control of a population are often buttoned up and hold out in a fortified area (such as a prison or cathedral) to await reinforcements or relief; in GGDM terms, this might mean the colony is liberated but the occupiers hold out in a Ground Base.

This is, as many others, an area more suitable for Special Operations Black-ops by positions, and Interventions by the Concierge.

- Asymmetric Conflict: At several points throughout GGDM, the idea is floated of possible revolts of colonies – mostly Conquered or Converted Colonies, sometimes Naturalized Colonies, and it is even possible (participants should not forget) that Friendly colonies may revolt if the story is ripe for it. All such situations, including insurgencies and partisan or guerrilla warfare against occupying forces (e.g., the French forces in Mexico or the French forces in the Papal States and Rome during the Second Republic and Second Empire), are asymmetric conflicts. This is a discussion which has come to the public consciousness due to U.S. Forces in Iraq and Afghanistan, but there are many other modern examples, such as the Viet Cong, FARQ, the IRA, the PLO, etc. Terrorism is the late 20<sup>th</sup> Century asymmetric conflict.
  - ✓ Not all insurgencies are effective, some turn out to be mere propaganda, e.g., *Werwolf* in Allied-occupied Germany in 1945 created far more fear than actual results.

The following The Network University should serve as a good primer for GGDM play:

- ✓ “So far we have been considering conflicts of interest between relatively similar parties. These are examples of symmetric conflicts (i.e. conflicts between parties with more or less equal resources). Conflict may also arise between dissimilar parties such as between a majority and a minority, an established government and a group of rebels, an employer and her employees, or a master and his servant. These are asymmetric conflicts (i.e. conflicts between parties with unequal resources). Here the root of the conflict lies not in particular issues or interests that may divide the parties, *but in the very structure of who they are and the relationship between them*. It may be that this structure of roles and relationships cannot be changed without conflict. In some views classical conflict resolution applies only to symmetric conflicts.

In asymmetric conflicts the structure is such that the top dog always wins and the under-dog always loses. The only way to resolve the conflict is to change the structure, but this can never be in the interests of the top dog. So there are no win-win outcomes, and the third party has to join forces with the under-dog to bring about a resolution. From another point of view, however, even asymmetric conflicts impose costs

on both parties. *It is oppressive to be an oppressor, even if not so oppressive as to be oppressed. There are costs for the top dogs in sustaining themselves in power and keeping the under-dogs down. In severe asymmetric conflicts the cost of the relationship becomes unbearable for both sides.* This then opens the possibility for conflict resolution through a shift from the existing structure of relationships to another.” – The Network University ([www.netuni.nl](http://www.netuni.nl)), “1.9 Power: Symmetric and asymmetric conflicts,” (unattributed, undated), captured June 26, 2019 (emphasis added).

- **Mess from Planet Naupactus:** Sometimes pacification and conversion can mix with insurgencies (see Fabrication of Order, 6 Combat, p. 1022, *infra*), war, invasion, refugees, and Balkanization of worlds (see Lebensraum, 3 Taxation & Census, p. 321, *supra*) for a complex, heady brew of political and military intrigue (in this case, the Third Messenian War):
  - ✓ “During the same war and after the capitulation of the Spartans besieged in Sphacteria, the Athenians installed a garrison in Pylos composed of Messenians from Naupactus. Thucydides underlines that they had hoped to exploit the patriotism of the latter in order to pacify the region. Though the Messenians may not have triggered full-blown guerrilla warfare, they nevertheless pillaged the area and encouraged helot desertion. Sparta was forced to dedicate a garrison to controlling this activity; this was the first of the ἐπιτειχισμοί / epiteikhismoí (‘ramparts’), outposts planted by the Athenians in enemy territory. The second such outpost was at Kythera. This time, the Athenians set their sights on the helots of Laconia. Again, pillaging and desertion did occur, but not on the scale hoped for by the Athenians or feared by the Spartans: there was no uprising like that which accompanied the earthquake.” – from Wikipedia article, “464 BC Sparta earthquake,” captured July 4, 2019.

The “Messenians from Naupactus” were refugees, rebels who had fled and were settled by the Athenians at Naupactus, also the site of a surprise Athenian naval victory in 429 B.C. following the defeat of the Helot Uprising after the Sparta earthquake of 464; the rebels returned to be used as Athenian local garrison forces in the area they had previously fled. *See?*

---

*“They were eventually assimilated by the Romans, and ceased to exist as distinct people ... By 82 B.C., the Roman dictator Lucius Cornelius Sulla conducted an ethnic cleansing campaign against this most stubborn and persistent of Rome’s adversaries and forced the remnant to disperse. So great was the destruction brought upon them that it was recorded that ‘some of their cities have now dwindled into villages, some indeed being entirely deserted.’ Samnites were granted Roman citizenship, and they were quickly absorbed into the Roman society.”*

– from Wikipedia article, “Samnites,” captured October 17, 2018 <sup>10</sup>

---

**Fate of the Samnites:** In space-opera fiction, the ecumenopolis Trantor (Asimov, Foundation) was reduced to a few hundred farmers farming open soil spots in the parks surrounding the former imperial Palace and the University grounds. The simple farmers called the remaining scholars of the University “scowlers.” This is ‘collapse of complex societies’ 25 years before Tainter. The reduction and abandonment of urban centers is consistent with Joseph Tainter’s signs of societal collapse; the Samnites eventually suffered a societal collapse inflicted by losses in various wars (possibly Pacification Combats in GGDM terms) against Rome. Although pacification –

conversion and naturalization – does not benefit from societal collapse of the losing population, it is possible and should be borne in mind by the Concierge and players.

Some people think that militant expansionism is inconsistent with the concept of a Republic, largely because of what happened to the Roman Republic. But the situation of the early Roman Republic (e.g., the Social War, Samnites) bears at least superficial similarity to the expansion of the United States across the continent, except that the disparity of forces was much greater in favor of the United States, just as the situation of the Cossacks being encroached by Imperial Russia reminds somewhat of the historically parallel situation of the Native Americans. Some people also believe or have believed in the past that democratic, socialist or communist republics would not make war on each other, leaving war as existing only between democratic and totalitarian states. I'd like to sell you a bridge in Antarctica.

The Ostrogoths (and many other 'barbarian invaders') suffered the same fate as discussed in *Shattered States*, 5 Government Titles, p. 640, *infra*. To wit:

- ✓ “All three peoples [the Ostrogoths, Visigoths, and Vandals] disappeared from history, and with them vanished the last cherished traces of Roman military skill in the West. Only the ruins of broad highways and frontier *castella* testified to the legionary past as the Dark Ages settled down over Europe. Another cycle had been completed...” – Lynn Montross, *War Through the Ages* (3<sup>rd</sup> Ed., 1960), p. 93.<sup>11</sup>

---

*“Paranoia strikes deep,  
Into your life it will creep,  
It starts when you're always afraid  
Step out of line,  
The man come and take you away!”*

Buffalo Springfield, “For What It's Worth” (1967)

---

## Endnotes.

<sup>1</sup> Citation: “The story of Mike Pence in a lot of ways is the story of the religious right, a story of the kind of compromises of principles, standards and values that they're willing to make to basically attain political power.” – McKay Coppins, MSNBC, December 5, 2017.

<sup>2</sup> Commentary: In 1854, Virginia Democratic Congressman Henry A. Edmundson was arrested by the House Sergeant-at-Arms for assaulting Ohio Republican Congressman Lewis C. Campbell during a debate *on the House floor*.

- ✓ On May 22, 1856, Edmundson accompanied South Carolina Democratic Congressman Preston Brooks and South Carolina Democratic Congressman Laurence M. Keitt, in an infamous caning assault on Massachusetts Republican Senator Charles Sumner *on the Senate floor* two days after Sumner had made a sexual-innuendo laced anti-Slavery speech in the Senate (e.g., what would Southern men do without slave women?). Mr. Keitt brought a pistol *onto the Senate floor* and brandished it during the attack to keep everyone away.
- ✓ Congressman Brooks challenged Massachusetts Republican Congressman Anson Burlingame to a duel with rifles (despite the anti-dueling laws passed after Alexander Hamilton's death in a duel with Aaron Burr), which Burlingame accepted, but Brooks backed out. Burlingame was a known rifle expert.
- ✓ Brooks resigned his Congressional seat, but was elected again; then died unexpectedly in January 1857.
- ✓ Congressman Keitt was censured by the House for his part in the caning attack, later in 1858 (after Brooks had died), he got into a fist fight *on the House floor* with Pennsylvania Republican Congressman Galusha A. Grow, which turned into a *brawl* involving 50 Congressmen.

- ✓ Mr. Keitt died serving the Confederate Army at the Battle of Cold Harbor (1864).

<sup>4</sup> Citation: *United States v. Kenneth Wayne Leaming*, 12-cr-5039-RBL, U.S. District Court for the Western District of Washington, as cited in Wikipedia article, “Sovereign citizen movement,” captured October 12, 2018.

<sup>5</sup> Citation: See excellent article by Prof. Warren Throckmorton, “The Popular Bonhoeffer Quote That Isn’t in Bonhoeffer’s Works,” August 25, 2016, on his personal site, [www.wthrockmorton.com](http://www.wthrockmorton.com).

<sup>6</sup> Commentary & Clarification: Originally “Friendly” colonies were called “Native” colonies – I found a remaining reference to Native Colonies when final editing the combat rules on July 4, 2018. At some point, I thought it would be a problem calling them Native colonies – at the least because of the Lost Colonist Primal State, and changed it to Friendly Colony. Friendly Colonies are completely loyal *for game purposes* as long as the legitimate authorities at the colony are loyal to the interstellar government and remain legitimate to the population, military and servants.

<sup>7</sup> Citation & Commentary: **Deleenn**: They fight bravely. They cannot harm our ships but they continue to try. **Morann**: Whether they fight or not they know they will die anyway so really is this bravery or simple desperation. – Babylon 5 movie, “In the Beginning.”

- ✓ The surprise Minbari surrender during their overwhelming final attack on the Earth in which they were assured of victory is one of the central elements of Babylon 5 television series. It is never explained what would have happened if Earth had surrendered first, the emphasis is on humanity’s resistance to the end. But there are three options: 1) Minbari occupation of Earth or something similar, setting up a Centauri-Narn-like situation; 2) Genocide of humanity or forced evacuation of the Earth population; or 3) Earth retains sovereignty, but is cowed, controlled, restricted in exploration and expansion, course of development is altered. Conversely, the Minbari ‘surrender’ – a deliberate inaccuracy because “surrender” sounds far more dramatic; inaccuracy and exaggeration are at the core of drama – was effectively a unilateral armistice and withdrawal (imagine if the United States had surrendered to Japan after the atomic bombs were dropped and agreed to mediation), no conditions were imposed on the Minbari (other than the Babylon 5 project): The Earth was not in any position to impose.

<sup>8</sup> Commentary: Reading recommendation; when I was young, the best Earth-occupation-by-alien-conquerors story I read was Timothy Zahn’s The Blackcollar (1983). It turned out that the Ryqril, the conquering aliens, were primitive warriors who obtained technology from others, the barbarians-with-the-bomb trope. I later found the sequel, The Backlash Mission (1986), at a used book sale in the late 1990s. I was not aware that he had written a sequel. It takes place at everyone’s favorite mountain fortress, Cheyenne Mountain Complex. These might be a good movie.

<sup>9</sup> Commentary & Citation: Note that during the Dominion War, the Dominion orbital bombarded a Cardassian world inflicting 800 million casualties in an attempt to obtain submission of their former ally who was beginning to resist being peacefully occupied and used by the Dominion. In this, Syria is somewhat in the same position, being in part peacefully occupied by their ally, Russia, upon whom the existence of the Assad regime depends (similar to South Vietnam in the 1960s). George Takei suggested that the Dominion War was the polar opposite of Roddenberry’s vision of Star Trek (i.e. it went off the rails, jumped the shark) while other opinions suggest that the end of the Cold War, Babylon 5, new writers and audience, and series ideological and optimism fatigue played into the darker, morally ambivalent drift of DS9. Information from Wikipedia article, “Dominion War,” October 26, 2018.

<sup>10</sup> Commentary: Wikipedia article cites to, quoting: “Edward Togo Salmon (1967). *Samnium and the Samnites*. Cambridge University Press. p. 30.” Linked to p. 30 of the book on Google Books.

<sup>11</sup> Commentary: Montross seems to be following the opinion of Charles Oman, Dupuy & Dupuy disagree:

- ✓ “Oman suggests that the Franks had learned nothing from their centuries of contact with the Romans so far as weapons, discipline and tactics were concerned, and that their successes were due simply to their extraordinary vitality, and to the degeneration of military art among their enemies. There is undoubtedly much to this; yet it cannot be the complete answer. There is evidence that Clovis was able to instill some discipline in his fierce warriors, and that he was an admirer of the Roman military system. His armies were small, and apparently he was outnumbered by his foes in many of his campaigns – particularly against the heavy cavalry of the Visigoths. He could not then, have been victorious without a greater degree of organization and tactical control than Oman would suggest.” – Dupuy & Dupuy, Encyclopedia of Military History (2<sup>nd</sup> Rev. Ed., 1986), p. 168.

*See Appendix ORD – Conversion & Pacification Examples*  
*See Appendix WR – Writ Examples, Land Grant Writ, Naturalization*

*“If a slave has a bad master, his ambition is to get a better; when he gets a better, he aspires to have the best; and when he gets the best, he aspires to be his own master.”<sup>1</sup>*

*“I didn’t know I was a slave until I found out I couldn’t do the things I wanted.”*

*“No man can put a chain about the ankle of his fellow man without at last finding the other end fastened about his own neck.” – Frederick Douglass*

*“I freed a thousand slaves. I could have freed a thousand more if only they knew they were slaves.”*

*“I had reasoned this out in my mind, there was one of two things I had a right to, liberty or death; if I could not have one, I would have the other.”*

*“I was free; but there was no one to welcome me to the land of freedom. I was a stranger in a strange land.”<sup>2</sup> – Harriet Tubman*

**The Chain About Your Neck:** GGDM makes no comment or assumption as to whether or not slavery exists among either the Major or minor species in Galactic Space. While there are many arguments against direct slavery – most practically, that machines can always do the work better and faster – creative science-fiction stories (especially up to the late 1960s), including space-opera settings, frequently featured various forms of actual slavery. *However*, thoughtful participants may realize that taxation of Converted Colonies (and even to some extent, Naturalized Colonies) and forced Balkanization might be construed as forced labor and/or a form of slavery.

- ✓ “Unrest simmered in Sicily because of its very subordinate role in Charles’ [Charles of Anjou] empire – its nobles had no share in the government of their own island and were not compensated by lucrative posts abroad, as were Charles’ French, Provençal and Neapolitan subjects; also Charles spent the heavy taxes he imposed on wars outside Sicily, making Sicily somewhat of a donor economy to Charles’ nascent empire. As Steven Runciman put it, ‘[The Sicilians] saw themselves now being ruled to enable an alien tyrant to make conquests from which they would have no benefit’” – from Wikipedia article, “Sicilian Vespers,” citing to Steven Runciman, The Sicilian Vespers: A History of the Mediterranean World in the Later Thirteenth Century (1958), p. 212, captured November 22, 2018.

In fact, depending on the interpretation, even Landing a new friendly colony or Unloading Population onto friendly colonies might be slavery or forced labor. Once the ships leave, the colonist have nowhere to go, no way off the planet. Thus we arrive at the science-fiction classic: corporate-owned colonies where the entire population consists of corporate employees and families.

- ✓ The South African documentary Bhambatha: War Of The Heads (2009) perhaps made the point best: Zulus were forced to return and work for wages on white-owned farms on lands that they knew belonged to their ancestors and had been forcibly annexed by European settlers. The products of their work were then available in stores owned by whites which they had to buy with their wages. We think nothing of this

latter now, as we are *conditioned to a capitalist-consumerism economy* (yes you are!, but you need to know the opposite to realize it...), but to Zulu farmers, formerly sovereign and self-sufficient homesteaders, it was alien and horrifying. While the Zulus were not slaves in the traditional whip-cracking sense, they had been much reduced in the larger economy of Natal colony.

- This would be called ‘culture shock’ by any definition. Add to this the Christianization of the Zulus vs. un-Christian behavior of the Europeans.
- But this is what the Romans did to the Celts in Britain that caused the Boudicca Revolt; the Romans took 1/3 of their harvest in taxes then sold it back to them at high prices. And took their lands and built settlements. History comes full circle through Queen Boudicca’s namesake, Queen Victoria (Victoria is Boudicca Latinized). The end result was the same.

GGDM play can be changed by various mechanisms available to the players and Concierge (the actual slave of the game) if it is important to avoid the appearance of slavery in the game.

GGDM may also assume the existence of oligarchic drift, individual wealth accumulation, economic and social pyramid structures, unless otherwise indicated.

➤ Alcoholism: Both Booker T. Washington and Frederick Douglas noted in their own ways that Negro slavery in the old South was a form of alcoholism for southern society. Compare Brooker T. Washington, “You can’t hold a man down without staying down with him” (or alternatively: “One man cannot hold another man down in the ditch without remaining down in the ditch with him.”) to Frederick Douglas, “No man can put a chain about the ankle of his fellow man without at last finding the other end fastened about his own neck.”

- ✓ “‘Serious historians don’t have arguments about what the [American] Civil War was about,’ [Ta-Nehisi] Coates said. ‘The people who started the Civil War said why they started it. They made it clear,’ he said, referring to the Articles of Secession. South Carolina’s declaration of secession – issued on December 24, 1860 – says the state was leaving the Federal Union because of the ‘increasing hostility on the part of the non-slaveholding States to the Institution of Slavery.’” – Graham Lanktree, Newsweek, November 3, 2017.<sup>3</sup>

- The entire South Carolina Declaration of Succession is available in PDF at <http://www.atlantahistorycenter.com/assets/documents/SCarolina-Secession-p1-13.pdf>, the referenced text appears at the bottom of Page 7.

I can picture a helot youth reasoning thus: So because your fathers defeated my fathers in battle, I am by law condemned to the life of a serf-farmer? Producing income and food for your warrior children? And my children and their children will be so condemned and required as well to keep this station below your children and their children? I don’t think so! This thought may occur in different ways and under different circumstances, but it will occur over and over again. Thus, the source of generational unrest in subjugated populations clashes against generational wealth degeneration of (and shifting circumstances of) their masters. Only social structures, worldviews, and great material-technological wealth disparity (i.e. Jared Diamond’s “cargo”) perpetuates the oppressive relationship over generations.

- ✓ The base flaw of any system where socioeconomic and legal status are determined solely by hereditary means – whether slavery or rulership – is that such a system discards the adaptive advantage of sapience, that which humans have over an amoeba.

Pre-industrial slavery (and before that, domestication of animals), must follow a set of readily definable conditions, that is, that the labor of slaves must produce enough to support the barest domestic subsistence of the slave population plus the entire ‘masters civilization’ built upon the backs of the slaves. Economist devised formulas describing slave economies.

- ✓ See Joseph Tainter, 2 Government Titles, EN 9, p. 604, *infra*, for discussion of subsistence and resource economics in the Protoclassical and Preclassical periods that probably formed the initial basis for slavery. To wit, slavery required socio-hierarchies to develop, which in turn, arise from warfare over subsistence deficits.

Predictably, a set of beliefs develop among the masters and slaves that support and justify the arrangement (what Friedrich Nietzsche called “master-slave morality”). Youth bulge can occasionally be a problem in slavery cultures as well, leading to slave revolts,<sup>4</sup> especially when a significant part of the slave population are males of fighting age (*à la* Spartacus), and also among the master class from lack of purpose or from primogeniture inheritance systems that leave the younger siblings poor.

- ✓ “Slavery allowed landowning, slave-owning whites to accumulate massive amounts of wealth while racking up major savings on labor costs (some economists estimate the value of slave labor to be as much as \$14 trillion). This money was passed down for generations, while the descendants of enslaved people are still suffering from the effects of slavery and Jim Crow laws. Going further back, white European settlers were given acres of land under the 1862 Homestead Act, after Native Americans were forcibly removed, and thousands died, following the 1830 Indian Removal Act. In 1790, ‘free white persons’ were given naturalization while immigrants like Asian Americans and other non-white groups were denied citizenship and therefore barred from owning land and accumulating wealth. These barriers to citizenship didn’t change until 1952.” – Lara Witt, “White Liberals Still Don’t Understand White Supremacy,” Harper’s Bazaar, August 16, 2017.<sup>5</sup>

- Ms. Witt cites to the *upper end* of a value range calculated, based on 2009 wages, for an article by Thomas Craemer appearing in *Social Science Quarterly*, Vol. 96, Issue 2, June 2017.

- Morality: By the definition of morality, societies and civilizations rarely do what *they* consider immoral, at the risk of their own legitimacy. The ghastly Cadaver Synod of 897 was apparently too much even for Rome; Pope Stephen VI was shortly overthrown by a popular uprising, imprisoned and strangled. But there has been much worse in the world unpunished.
  - ✓ Merriam-Webster online dictionary definition at *morality* generally, but more specifically: **3**: conformity to ideals of right human conduct.

Further, within the moral code of any time, there are expediencies, rationalizations and priorities, with the existential and prosperity topping the list. Examples? Self-defense and defense of others is a defense to charges of harming or killing another, especially when there are no other reasonable options at the moment. Nuclear-armed countries will use nuclear weapons against an existential threat, even if it means the end of humanity or life on Earth.

It thus follows that any society that has slavery or forced labor doesn’t consider it immoral *per se*, but might be neutral toward the practice. It is likely that the very first instances of slavery were war captives, who were taken to make up for the labor losses suffered in battle.

- ✓ “But why had science lost its way in the first place? What appeal did Pythagoras’ and Plato’s teachings have for their contemporaries? They provided, I believe, an intellectually-respectable justification for a corrupt social order. The mercantile tradition which had led to Ionian science also led to a slave economy. You could get richer if you owned a lot of slaves. Athens, in the time of Plato and Aristotle had a vast slave population. All of that brave Athenian talk about democracy applied only to a privileged few. Plato and Aristotle were comfortable in a slave society. They offered justifications for oppression. They served tyrants. They taught the alienation of the body from the mind, a natural enough idea, I suppose, in a slave society. They separated thought from matter. They divorced the Earth from the heavens.” – Carl Sagan, *Cosmos*, Episode 7.

Athens is believed to have had the largest slave population in ancient Greece, but Athens also has the misfortune of being the place we know the most about from that time, and to whom the luster of ancient Greece is most attached (i.e. disproportionate historical representation).

Even societies that find slavery morally repugnant may find their way to various forms of forced labor in the name of social good, for example, prison labor or the late Swiss *Verdingkinder* and *Kinder der Landstrasse* social engineering schemes.

All societies have engaged in social engineering, long before the concept had a modern name attached: It’s called childrearing. The more involved public, governmental and religious institutions are in the raising of children, the more social engineering is applied (e.g., “tyranny in the nursery” – Benjamin Disraeli). It’s just a natural consequence. Children can be taught to be tolerant or intolerant, inclusive or exclusive, moral or immoral. This should not be construed as any argument against public schooling or in favor of homeschooling; however, as home schooling is limited by the parochial views (e.g., racism, etc.) and questionable abilities of the parents and suffers from many other pitfalls, such as a potential lack of socialization.

- ✓ Think about our moral language. To call someone a traitor is a moral judgment; the term (like murder) carries with it an inherent sense of immorality. Most likely, the traitor is aware of the moral judgment that will be levied for the acts (traitor implies an act that reveals traitorous intent). To someone else, the traitor may be a moral hero (depending on circumstances). Countless dramas have been written on these points.<sup>6</sup>
- Encomienda: It is important to realize that those who practiced slavery did so without remorse, shame, guilt or reservation, for example, the Spanish *Encomienda* system in which the plight of the indigenous population was clearly not a consideration.<sup>7</sup> This point gets lost in most discussions of slavery; we have become numbed by repetition of the arguments and images of brutalities over the last 100 years, and especially in the last half century. Yet this lack of guilt is indicative of a worldview that had rationalized and institutionalized slavery;<sup>8</sup> remorse, shame, guilt and reservations are for acts that are contrary to the moral view of ourselves and society. We can never forget that this was a worldview, regardless of how wrong we think it is now.<sup>9</sup>
  - ✓ “Well, films that were favourites were those that influenced you at the time, rather than when you go back and look at them now. So you have to put them in the context of the time when you first saw them. And when I first saw, for instance, M\*A\*S\*H – the Robert Altman movie – I’d never seen a movie like it, all that overlapping dialogue. When I first saw *The Battle of Algiers*, I never [knew] a movie could be so

real. When I saw Morgan: A Suitable Case for Treatment, for some reason that had a big effect on me. And if I see any of them now, I'm not sure if I have the same response." – George Miller as quoted by Anne Billson, "George Miller Talks about Mad Max, Heroes & Tina Turner: The 1985 Interview," previously unpublished interview published on Multiglom: The Anne Billson Blog, May 12, 2015.

Intellectual amateurs often laugh off the worldviews of preceding ages, or talk condescendingly about them – I remember in my youth we used to joke about the British wearing bright red uniforms and standing in line shoulder to shoulder – if you want to know the technical military reason, see *Shoulder to Shoulder*, 4 Combat, p. 985, *infra* – but along with the military reasons there was a set of vague beliefs about pre-destiny, sin, death and punishment and a low-hanging Christian God that accorded with the age. It is the actions taken by our ancestors based on what they believed, their worldviews, that make them serious matters, *forces us to take them seriously*. *Earnestness* is also important to suspension of disbelief in fiction. And it will be so for our future descendants as well when they look back at a pre-colonial Earth.

✓ **“Anne Billson:** Did you see Bartertown as intrinsically evil?

**George Miller:** No, just as profane. Just concerned with everyday getting on, making a buck-type world, which we are all part of. And in a sense, because it's not very broad in its vision, ultimately evil in its function. Without people consciously trying to be evil. It's just the way we conceive everyday life as being ultimately corrupt and cynical, but there's no room for the broader issues. Mainly because they're so limited, only evil in that sense. And the people in it don't really see it as evil." *Id.*

One day in graduate History of the Enlightenment class, I mentioned that Tsar Peter the Great had “sold out” the Russian peasants. Dr. Paul Mason, a bit of an odd character himself, thought this comment was supremely amusing. He didn't say anything afterward that I recall, but clearly he was amused by it, likely because it's a modern idea, which probably never occurred to them in quite the same way. Maybe I sounded like a communist revolutionary? But it's true history, Peter the Great gained power and stability by enslaving the Russian peasantry at a time when peasants of other nations were breaking free of economic bonds and/or being displaced. They would not have thought in Moscow or St. Petersburg that the Tsar owed any *Nobless Oblige* to the peasantry since his power did not derive from the peasants, but rather, from royal primogeniture and the support of the Boyars. And when they would not support him either, he abolished the Boyars and relied on his new model European army.

✓ “Political power grows out of the barrel of a gun” – Mao Zedong.

---

*“Pragmatic ethics is a theory of normative philosophical ethics. Ethical pragmatists such as John Dewey believe that some societies have progressed morally in much the way they have attained progress in science. Scientists can pursue inquiry into the truth of a hypothesis and accept the hypothesis, in the sense that they act as though the hypothesis were true; nonetheless, they think that future generations can advance science, and thus future generations can refine or replace (at least some of) their accepted hypotheses. Similarly, ethical pragmatists think that norms, principles, and moral criteria are likely to be improved as a result of inquiry.”*

– from Wikipedia article, “Pragmatic Ethics,” captured July 2, 2019

---

**Pragmatic Ethics:** Pragmatic ethics is an underpinning of our civilization, even when not named. People can picture civilizations learning moral or good behavior in the same way as a child, for which historiography plays a vital role, e.g., does a person always blame others for their problems?<sup>10</sup> Pragmatic ethics is a function of literary fiction, much science-fiction is about pragmatic ethics leading to true interstellar civilization. It is also part of historical assessment:

- ✓ [Interview] “With the extraordinary ingenuity and real genius that was involved in taking a physical reaction that was discovered on a benchtop in Nazi Germany in 1938, and turning it into this whole new field of energy, for power, for medicine, for all sorts of humane uses, but also for terrible, terrible weapons, it’s easy to shrug and say those were terrible things we should of never have done that. As a historian, I feel that it’s real Monday morning quarterbacking to look back on the past and say those people shouldn’t have done that, those were not nice people. I think, instead the way to think about the past had its own principles and rules and its own challenges and fears. One has to say why? Why did they do that? What was it that led them to make the decisions they made, what can we learn from what they did, and what they thought and what they said about what they did? All of that is part of what we call history and its much more helpful I think to us now, looking at the future we are looking forward to, to try to understand what happened, not simply to condemn them out of hand, and say ‘well we wouldn’t have done that, we’re better people than that.’ Would we not have? What would we have done?” – Richard Rhodes, *The Half-Life of Genius: Physicist Raemer Schreiber* (2018).
- ✓ [Interview] “[The Senator from Illinois] has every right to hide from history if she wants to, but it seems she is trying to hide history from us, and I think that’s a mistake.” – Shelby Foote, *Book TV C-Span 2*, July 26, 1994 (video on YouTube).

The justification for the Nuremburg Trials (Nazi hunting, the ICC) is pragmatic ethics. Still, the Nuremburg Trials were seen then and now, as an exercise of the victors (i.e. the de-Nazification of Germany) and not of justice. On the one side, the crimes of the Red Army against German, Polish and other civilians were never addressed at all (the Soviets never signed the Geneva Convention of 1929, but the Russian Empire had ratified the previous Hague Convention) and on the other, results such as the courts-martial proceedings related to the Biscari Massacre carried out by American soldiers in Sicily in 1943 are hypocritical when compared to the results of the Malmedy Massacre Trials held at Dachau in 1946. One might argue that the atrocities carried out by the German military are far greater than the atrocities carried out by the American military (but not so much more than were carried out by the Red Army), but in the individual cases comparison, the argument is irrelevant: In both POWs and civilians were shot without provocation.

- ✓ This apparent double-standard is one that still haunts and undermines the U.S. credibility in the world; for example, that the United States signed but has not ratified the Rome Statute to join the International Criminal Court (ICC) and has seemed alternately hostile, stand-offish, and cautiously supportive toward the body. This is not likely to change as long as the United States remains one of the major powers on Earth; the absurdity is glaring: U.S. support of the ICC is conditioned on whether or not it promotes *U.S. interests*. This is sovereignty and nationalism laid bare.
- ✓ For their part, the Soviets always complained that the United Nations was just a puppet of or extension of U.S. foreign policy; the United States has long been (embarrassingly) hundreds of millions of dollars in arrears in annual U.N. contributions:

- “...the Senate has refused to appropriate the full amount of the standard United States contribution to the world body, on the ground that the organization is inefficient, wasteful and often contrary to American interests. But now it was praising the United Nations for its recent efforts in mobilizing world opinion against the Soviet occupation of Afghanistan, for example, and for helping with a solution to the Iran-Iraq war.” – Richard Bernstein, “Why Does the United States Refuse to Pay Its U.N. Bill?” New York Times archives, August 7, 1988.

In short, the United States is historically slow making good the promise to pay the piper, but runs to the piper whenever it needs a quick tune! You knew this already.

---

*“A vendor came to Kazanga in a battered spaceship loaded with books. He was gaunt, white-haired, and a little mad. A celebration was held for him, for novelty was appreciated on the outer worlds.”*

– Robert Sheckley, “Pilgrimage to Earth” (1957)

---

**A Slave to Starships:** Implicit in most space-opera or interstellar science-fiction settings is the idea that starships cost a staggering amount of money/resources and require extensive support, such that they are owned and controlled by governments, corporations and very wealthy individuals, guilds or groups. Until starship technology and interstellar society reaches a very advanced state, starships are not like cars or, before cars, horses, ubiquitous symbols of individual freedom of movement in their times.

There is thus a suggestion that those who travel and colonize new worlds by starship in early interstellar societies are left isolated, vulnerable, subservient to and dependent upon the owners and crews of starships that connect the dots of civilization in space. They may be forced, for example, to mine out the natural resources of their world, filling starship holds, in exchange for meagre returns in supplies, manufactured goods, and culture, without colony development. They may then be abandoned and forgotten, their world becomes a backwater, as depicted in the excellent social sciences study, “Punk Zone,” (Epic Illustrated, October 1981, p. 67) about violent young street gangs, remnants of humanity, and sociocultural degeneration (or evolution) on a strip-mined world.

- ✓ “Well, students, at one time, Devron was a boom planet; that is to say, the people who came here did so with a rampant enthusiasm and sense of hope. There were precious ores to be mined. Of course, that was a number of years ago. Now the planet is that harsh little ball your visi-screens depict ... ill-equipped to offer sustenance to its meagre population of settlers. ....They were originally hard-bitten individualist bent on making easy fortunes. But their dreams were strip-mined with the ore. ... Exhausted of adventure, they are content with tilling the land (what’s left of it) and carrying on light trade with the more prosperous federation worlds.” *Id.*, Epic Illustrated.

Although GGDM does not make any comment on the existence of slavery in the interstellar setting of the game, it does exist in the real world, today, in the here and now.

- ✓ “The 2016 Global Slavery Index from the Walk Free Foundation said modern slavery comes in many forms, from domestic to sexual to bonded and child labor. The term refers to a situation in which a person has taken away another’s freedom so they can

be exploited.” – Corinne Abrams and Qasim Nauman, “India has the most people living in modern slavery,” Wall Street Journal, India Real Time, June 2, 2016.

Human rights organizations estimate about 45 million people are enslaved and the situation regarding sale of slaves in post-Gaddafi Libya has gained attention after the auctions were filmed and published by a credible international news organization. Slavery is sometimes obvious and sometimes not so, so in some situations a person or group can go voluntarily, legally or illegally, to another country seeking work or opportunities, and end up being held against their will by force or threat of being reported; in other situations, loan systems, economic systems, land ownership, or poverty, such as those in northern India and the early 20<sup>th</sup> Century in the United States, serve to indenture employees, and their families, to the point of near-slavery condition (e.g., “Sixteen Tons,” sung by Tennessee Ernie Ford, 1955). In conflict zones, child soldiers are a form of slavery, in Thailand, there are reported to be fishing boats served by enslaved crewmen.

➤ Interstellar Law: Slavery, piracy, religious wars drove development of *international law*:

- ✓ “In general, describing the slave trader as *hostis humani generis* emphasized the idea that these crimes were offenses against humanity. One of the most important conceptual developments that led to the development of the contemporary international human rights regime was the idea that violations of human rights are of global and not just local concern.” – from abstract of The Slave Trade and Origins of International Human Rights Law, Ch. 6 “Enemies of Mankind,” Jenny S. Martinez, found on Oxford Scholarship Online, February 14, 2018.

- See further, *Hostis Humani Generis* excerpt, Commerce, *infra*.

By general agreement and actions, the post-WWII sovereigns generally treated Nazi party members (and regime associates) as *hostis humani generis*, except where it suited their purposes otherwise (e.g., German scientists who emigrated after the war, Operation Paperclip); similarly, modern terrorist are likewise generally *hostis humani generis* except where it is inconvenient to a particular sovereign’s purposes (e.g., the Entebbe Raid, Uganda, 1976).

---

*“However, the violence produced an unanticipated paradox. The more violent the Thirty’s regime became, the more opposition they faced. The increased level of opposition ultimately resulted in the upheaval of the Thirty’s regime by Thrasybulus’ rebel forces.”*

– from Wikipedia article, “Thirty Tyrants,” captured July 2, 2019

---

*“Swear allegiance to the Flag  
Whatever Flag they offer  
Never hint at what you really feel.”*

– Mike and the Mechanics, “Silent Running” (1985) <sup>11</sup>

---

**Conversion & Naturalization**: Conversion and Naturalization are the processes of bringing Conquered Colonies into the sovereignty, political and economic networks of the conqueror’s society (and to the conqueror’s benefit), as much as can be done considering the situation. Conversion attempts are never required, a colony can remain perpetually a Conquered Colony. <sup>12</sup>

- ✓ “I am an Indian. I must bow to the laws of the Pueblo, but I cannot accept its ways; I cannot cut the heels off my white man’s boots; I cannot cut the seat from my pants

and cover myself with a blanket. I am an Indian. I went to the white man's school and learned to be a carpenter, but I cannot drink whiskey as the white man does nor go where he goes nor live as he lives ... I am a man who must find out who he is." – Frank Waters, inside cover of The Man Who Killed the Deer (1942).

Conversion and Naturalization require patient effort are not automatically successful, however, as time-consuming as Conversion and Naturalization can be, the colony does not suffer damage.

- ✓ See Pacification Theory, Making War Through Peace, 6 Combat, p. 1020, *infra*.
  - ✓ **Dr. Hans Fallada:** I mean, in a sense we're all vampires. We drain energy from other life forms. The difference is one of degree. – Lifeforce (1985).
- **Conversion:** Only Conquered Colonies may be Converted; colonies that are subjected to Orbital Bombardment Combat by the conqueror are instantly Converted (however, the colony and planet are damaged and there is a risk of *apostasy*). Conversion requires three elements:
- 1) A continuing credible threat of force if the colony does not comply,
  - 2) Restoration of civil order under a central authority (i.e. a puppet regime), and
  - 3) Strategic control of the planet surface, especially resource and population area.

Conversion is a matter of time and force, and is thus suitable for resolution by die roll.

- ✓ Conversion Attempts *are not* subject to failure of the Power Activation due to inactive Constructural Elements on the target colony (their resistance is a given). Game mechanically, Cohering attempts cannot be applied to Conquered Colonies (see Money Can't Buy You Love, 5 Culture, p. 422, *supra*) and Conquered Colonies are likely to have inactive Constructural Elements. However, upon successful Conversion, the conqueror inherits the mess, newly converted colonies may be difficult.
- ✓ Each Conversion Attempt (by activation of the Order Power) requires a die roll on one ten sided die, and is successful if the modified die roll is greater than the population of the Conquered Colony divided by ten.
- ✓ One is subtracted if a Pacification Combat (see 6 Combat, *infra*) has been initiated against the colony (this implies failure to automatically Convert the colony).
- ✓ Two is subtracted from the die roll if the colony was Looted (see Looting, 3 Commerce, p. 1210, *infra*) by the *current sovereign* before the Conversion Attempt.
  - If you orbital bombard a colony, they will instantly submit, but will never join your empire voluntarily. If you send down the troops and lose a ground war (i.e. Pacification Combat) and won't bombard from orbit, they have won a major victory. If you loot them, they will despise you.
  - "Thief, thief, thief! Baggins! We hates it, we hates it, we hates it forever!" – Gollum, in J.R.R. Tolkien's The Hobbit (1937).
- ✓ One is subtracted from all Conversion die rolls if the conqueror has no Diplomatic Spaces (see 2 Diplomacy, *infra*) beyond First Spaces with the owner of the Native Population Type of a Conquered Colony. Colony Combat can be a First Contact.
- ✓ One is subtracted if any population is Loaded, Unloaded, or Landed on the Conquered Colony's planet (even their own) by anyone prior to the Conversion Attempt.

- ✓ One is added to the die roll if the target colony is part of a Balkanized planet that contains a sovereign colony of the conqueror's Native Population Type (i.e. familiarity).
- ✓ One may be added, at the discretion of the Concierge, if the Construction Power was activated at the Conquered Colony after conquest (depending on what was built). It is possible to activate the Construction Power without Unloading RPs, just for show.
- ✓ Two is added to the die roll if RPs greater than the taxation value of the colony were Unloaded from Cargo Ships (see Combat Engineers, 1 Construction, p. 664, *supra* and Downloading, 2 Commerce, p. 1202, *infra*) at any time *prior to* the Conversion Attempt (i.e. bribery, reparations), *but not if the colony was subjected to Orbital Bombardment Combat* by the conquerors. RPs downloaded to Conquered Colonies are at normal value, not enhanced value (opposite of Looting, 3 Commerce, p. 1210, *infra*).
  - Due to processing sequence it is not possible to Unload before Conversion in the same Regular Turn (Order is before Commerce) unless paired with a Construction Power Activation (Material Handling, 1 Construction, p. 664).

Conversion Attempt procedures and modifiers may be altered by the participants through experience (to make conversion easier, more difficult, or more 'realistic') or by development of other abilities in the game, such as technology, Writs, Corporations, etc. The Concierge may also make any judgments necessary based on their top-down view of the situation (i.e. high insurgency levels); in this, the Concierge *must represent the population* of the target colony (see 5 Combat, *supra*). Special Operations Black-ops at the colony may also be a factor.

One factor that game participants may take into account is whether the conquering power supports the legitimacy of the current planetary government, replaces that government with a friendly government (i.e. puppet regime), and/or imports external cadres to govern the conquered world. One might compare Government Titles, etc. As an example, following the defeat of Athens by Sparta in the First Peloponnesian War, the democratic government of Athens was replaced by a pro-Spartan oligarchy known as the Thirty Tyrants (404-403 B.C.).

- ✓ The Tyrants were overthrown after a year; after which Athens suffered a cultural and identity crisis, as discussed in Hand Me The Hemlock, 1 Disruption, p. 256, *supra*. Socrates was tried (on the charge of "corrupting the youth") afterwards on the strong belief that he was a supporter of the Thirty Tyrants and oligarchy. Plato's eyewitness account is the most famous philosophical work in history; Xenophon, the famed military commander, another student of Socrates, who probably was not present, later wrote the book Anabasis (about 370 B.C.). Anabasis possibly inspired Alexander the Great, a student of Aristotle, who was a student of Plato, who was a student of Socrates, to conquer the Persian Empire (334 B.C.).
- Taught Their English To Our Young: It is possible by modifiers and/or large colonies to create a situation where a colony can never be converted unless something changes, e.g., the population is reduced by Orbital Bombardment or forced removal on Colony Ships, creating other problems.

If a Pacification Combat has occurred at the Conquered Colony (risking *apostasy*, see Alieny Apostasy, 3 Disruption, p. 283, *supra*) and the result was a suppression (see Fabrication of Order, 6 Combat, pp. 1022-1023, *infra*), two Conversion attempt rolls (at -1 modifier each, *ut supra*) at that colony may be made in a Regular Turn for each activation of the Order Power for the purpose of Conversion targeting the colony *and the total of the two Conversion*

*rolls are added together and treated as one.* However, for each failed Conversion Attempt, one population factor is lost from the Conquered Colony.

Pacification Combat may thus be required to convert large colonies, i.e., the ability to add die rolls from two attempts may be the only way to get a sufficiently high number for conversion. When conquering large colonies, bring an occupation army. A strategy for conquest thus might be to conquer small **alien colonies** and then grow and develop them into large colonies; nothing works to make people happy to see you like granting prosperity and peace.

- Incurable Acute Alterity: In extreme alterity situations between conqueror and conquered, the Concierge may simply block any Conversion attempt on the Conquered Colony, declaring that the *otherness* of the two species prevents the colony from ever being Converted (e.g. humans and bees, see *Let it Bee*, 1 Diplomacy, p. 1105, *infra*, or *Truly Alien Primal States*, see 6 Beginnings, p. 64, *supra*). Which raises the question of why conquer those colonies?

- ✓ Merriam-Webster online dictionary at *alterity*: otherness; specifically: the quality or state of being radically alien to the conscious self or a particular cultural orientation.

Should I refrain from stepping on a colony of ants on the sidewalk, would they ever be successfully ‘converted’ or ‘naturalized’ to me? There are many possibilities that the Concierge may take into account that cannot be embraced by the over-simplistic conversion die roll system presented here (e.g., SQ differences), for example, that there are some colonies that might never be converted or that conquest of a colony might cause a complete breakdown of the central systems and authorities. You cannot ‘domesticate’ ants! Of course, I don’t step on an ant colony on the sidewalk, but for other sorts of reasons. And the ants will never know that they were spared; they just keep on doing ant things.

- An Accommodation: While conquest and conversion is clearly a tyrannical situation, there is a limit to which the loyalties and actions of conquered subjects can be commanded or trusted.
  - ✓ “Love Thy Neighbor”; is this a command? Is this a command with which anyone has ever been forced to comply? Can you make me do that? It’s not in the same category as a command to relinquish goods or provide services. You cannot make me believe.

Trust is entirely a different matter, as it requires the acceptance of another’s intelligence and manners as valid and worthy.

- ✓ For example, the Romans knew that people whom they had conquered, and whose lands, liberties, and tribute they had taken would never like them and could never be trusted. The Romans only asked that conquered peoples obey Roman law, acknowledge Roman gods, and pay tribute. The Romans knew, however, that their children and children’s children would grow up in the Roman system and know nothing else (except, apparently, in Palestine). But in the Roman world, the conquerors and conquered were all humans. Would it work that way between distinctly alien species, proud starfaring civilizations? What happens when the new masters are so ... alien?

Thus, at the time that a Converted Colony becomes a Naturalized Colony, and the Naturalized alien population is accepted into the conqueror’s civilization, and vice versa, the alien population assumes all cultural and technological traits of the conqueror (however, this is a tricky bit, e.g., Fundamental Realities, see Alienation section below).

- ✓ “Peace and trust will still win the day, despite all your losing.” – Led Zeppelin, “Immigrant Song” (1970).

- Naturalization: Naturalization of **alien colonies** (‘alien hoarding’) is really a matter of legitimacy (i.e. shortly, a monopoly on legitimate physical force); that the converted populations accept the legitimacy of the conqueror’s rule<sup>13</sup> while the conqueror on the other tentacle, must also accept the cultural legitimacy of the subject population (e.g., Cnute the Great’s rule of England as opposed to the Norman Conquest).<sup>14</sup> Only Converted Colonies may be Naturalized, and a colony *may not be both* Converted *and* Naturalized on the same Regular Turn.

By way of example, extremes of cultural affinity have occurred in the 19<sup>th</sup> and 20<sup>th</sup> Centuries in relation to colonization. Some in India became ‘more English than the English,’ adopting English mannerisms and sensibilities in the extreme; the term “boko harem” originally referred to those of Central Africa who adopted European dress, customs and learning; and despite being treated poorly and culturally suppressed by the Japanese, many in the ancient Ryukyu Kingdom sought to earn the respect of the Japanese and became ‘more Japanese than the Japanese’ while still being treated as lesser savages by their conquerors.

Another very good historical example of the naturalization difficulties is the Tudor Conquest of Ireland from 1529 to 1603 A.D., e.g., The Nine Years War, the Desmond Rebellions, Surrender and Re-grant, the Plantations, the Lordship, etc. Wikipedia has a good article on this subject for participants to reference. It contains all elements: Forced Balkanization (e.g., the Plantations), Pacification Combat and population loss (e.g., Desmond Rebellions and the seneschals), interference by foreign powers (e.g., Spain), religion (e.g., Papal excommunication of Elizabeth I, Henry VIII’s break with the Pope), all caught up in the chaos of The Reformation and dynastic disputes. See *Beyond the Pale*, 3 Reformation, p. 1400, *infra*.

- ✓ Naturalization is the only activation of the Order Power that can fail due to inactive Constructural Elements. When a Naturalization attempt is made, the target colony is checked to see if it obeys the Power Activation (see Power Off, 2 Constructural Elements, p. 193, *supra*). Enlightenment (true enlightenment!) can be used to increase the chances, but if the colony does not obey the Power Activation, the Naturalization attempt fails on that turn regardless of what the participants and Concierge may desire; ‘they’ (‘dem stupid aliens) are not quite getting it yet!
- ✓ Naturalization is accomplished by activation of a Special Writ of Naturalization on the same Regular Turn as the Power Activation that is only applicable to the target colony (and requiring a Fuzzy Group). The Writ must be in proper form, see Form of the Writ, 2 Writs p. 438, *supra*. Acceptance of the Writ is entirely at the discretion of the Concierge, based on judgment of the colony’s true status and the process, and history with the current conquerors (and possibly, also the story arc of the game); but once the Writ is accepted, it only needs to be activated once to Naturalize the colony.
  - E.g. “In their quest for new settlers the German rulers of Brandenburg and Saxony deemed religious affiliation a private ... matter, a position which the Dutch had long accepted.... Nevertheless, because credal affiliation could easily be confused with political loyalty, bigoted rulers like Louis XIV or Leopold I failed to see how non-Catholics could ever be loyal subjects.... Despite

this, however, the notion was in the air that religious association might be irrelevant to citizenship.” – Raymond Birn, Crisis, Absolutism, Revolution: Europe 1648 to 1789, 2<sup>nd</sup> Ed., pp. 173-174.

- See further citizenship discussion, *ut infra*. See full quote, *ut infra*.

Orbital Bombardment, Pacification Combats, Looting, Raids, and removal of population from the colony by the current owner should all weigh against Naturalization.

Obviously, there is going to be some prior communication between the position and the Concierge regarding Writ of Naturalization. It should not be complex or lengthy, the Concierge is either going to say yea, or nay and then provide reasons why it cannot be accepted at this time. A low-level insurgency is not an *automatic bar*. Positions can, of course, take a blind shot at it, but the Writ must be either submitted in advance or with the Regular Turn actions.

- ✓ If the Naturalization failed due to inactive Constructural Elements the Fuzzy Group *will not be actualized* to activate the Special Writ but the Power Activation is used.

The game optimistically assumes that if enough resources are expended and the position tries hard enough, almost any Converted Colony can be Naturalized. The Concierge is not strictly bound by this; there may be good reasons why any colony, alien or even of the same Native Population Type as the conqueror, will never be Naturalized. Consider Rome and the Jews, two ancient cultures which we understand well and are well studied; it would be hard to find two more incompatible cultures than the Roman Empire and the Jews of Palestine! The Romans would never accept any gap in their complete control of the Mediterranean coastline (which they called *Mare Nostrum*, “our sea”) or interruption of their overland trade routes from Syria to Egypt, and the Jews would never accept the Imperial Cult, any Roman gods, or a king elected by the Roman Senate. History and religion records what happened.

- Cuba Libre!: GGDGM does not anticipate that a Naturalized Colony will ever be reduced in status to a Converted Colony without change of ownership. It is not impossible. However, Naturalization is considered permanent, and the Writ of Naturalization cannot be voluntarily undone or revoked by the position, it’s not just a political convenience.

A Conquered Colony that contains the conqueror’s Native Population Type is automatically a Friendly Colony (at the discretion of the Concierge), unless it has been Naturalized by another position. If the colony was ever Naturalized, it cannot (likely) never be a Friendly Colony (they have been culturally contaminated by aliens!) to the owner of its Native Population Type, but a +2 modifier is added to all Conversion Rolls by the new owner and it can (probably) be Naturalized again. This is all at the discretion of the Concierge, of course; it could be decided that the colony can be reintegrated, but there are lots of factors, acceptance, work.

---

*“Despite signs of spiritual revival in the late seventeenth century, secular values gradually were replacing religious ones as major influences on European life. By 1715 it had become unfashionable to go to war in the name of rival Christian creeds, and within states themselves, a few princes noted the political and social impracticality of inconveniencing religious minorities. In their quest for new settlers the German rulers of Brandenburg and Saxony deemed religious affiliation a private ... matter, a position which the Dutch had long accepted.... Nevertheless, because credal affiliation could easily be confused with political loyalty, bigoted rulers like Louis XIV or Leopold I failed to see how non-Catholics could ever be loyal subjects....”*

---

*Despite this, however, the notion was in the air that religious association might be irrelevant to citizenship. Nurturing such a position was an accompanying movement that subjected religious practice to rigorous critical analysis, ridiculing unproven credulity, and weakening traditional belief.”*

– Raymond Birn, Crisis, Absolutism, Revolution: Europe 1648 to 1789, 2<sup>nd</sup> Ed., pp. 173-174

**Civis Sum:** Naturalization should not be confused with the modern process of citizenship. The modern forms and concepts of citizenship – *jus sanguinis*, *jus soli*, *jure matrimonii* – have not always been in effect; for example, the ancient biographer Plutarch was required in the 1<sup>st</sup> Century AD to be *sponsored* for Roman Citizenship by another Roman Citizen (admission to the bar of a court still operates in that way), even though by that time, the Greeks were arguably ‘naturalized’ to the Roman Empire and he was born to parents who clearly resided inside the Empire. Some places in the modern world still hold conversion to their religion as a requirement of citizenship. Thus, naturalization of an **alien colony** in GGDM should not be considered an automatic grant of citizenship to the population, which could be a whole other matter (science-fiction stories present additional interesting citizenship issues, e.g., The Bicentennial Man’s (1976) curious quest to be declared a human in Isaac Asimov’s Foundation Universe<sup>15</sup>); naturalization here refers to political and cultural acceptance of alien legitimacy. Citizenship – reciprocation of legitimacy – has been a long-running issue, and was of early importance to civilizations, consider:

- ✓ “The number of helots in relation to Spartan citizens varied throughout the history of the Spartan state; according to Herodotus, there were seven helots for each Spartan at the time of the Battle of Plataea in 479 BC. Thus the need to keep helot population in check and preventing rebellion was one of the main concerns of the Spartans. Helots were ritually mistreated, humiliated and even slaughtered: every autumn the Spartans would declare war on the helots so they could be killed by a member of the Crypteia without fear of repercussion. Uprisings and attempts to improve the lot of the helots did occur, such as the Conspiracy of Cinadon.” – from Wikipedia article, “Helots.”
- ✓ “As Spartan citizenship was inherited by blood, Sparta increasingly faced a helot population that vastly outnumbered its citizens. The alarming decline of Spartan citizens was commented on by Aristotle.” – from Wikipedia article, “Sparta.”

Only male Spartan citizens (Spartiates) could be hoplites (warriors), so Spartan combat losses were particularly devastating (like the loss of French Knights at Crecy and Agincourt). This military idea continues with concepts such as technology as an offset strategy over quantity, and in militant space-opera fiction (e.g., Starship Troopers (1959), in which Heinlein pontificated a Spartan-like citizenship scheme) where ‘lower tech’ and indigenous aliens always vastly outnumber ‘high tech’ humans (on this latter, see Arthur C. Clark’s “Superiority” (1951)).

- ✓ “What matters is not whether Paul went there [to Spain], or if he really was executed at Rome during the reign of the emperor Nero, but rather the person of Paul himself. When he was arrested as a threat to public order, his Jewish enemies having complained to the Romans, Paul needed only two words to change the balance of power – *civis sum*, ‘I am a citizen’ – a Roman citizen. The fact that he was a Roman citizen meant that, unlike Jesus, he could neither be handed over to the Jewish authorities for judgment nor summarily executed by an angry Roman governor. A Roman citizen

could appeal to the emperor’s justice, and that is what Paul did.” – Prof. Michael Kulikowski (Pennsylvania State University), “Christians were Strangers: How an obscure oriental cult in a corner of Roman Palestine grew to become the dominant religion of the Western world,” *Aeon*, January 30, 2017.

One wonders therefore, how the story of Jesus would have been different if he or his parents were Roman citizens? No crucifixion, no Christianity, mission fail. *The history of the West rests on that one fact.* If you are picking your Messiah, don’t pick a Roman citizen.

✓ See continued discussion of Subjects and Citizens, 2 Government Titles, p. 599, *infra*.

*“She was in full-on denial. When confronted with the pictures she actually told my father that someone else must have gone in there and done this. Until then, my father never understood what it was like to stare delusion in the face. He thinks in the end that she actually believed her own fiction because the horror of what she had done to herself and those animals was too much for her psyche to handle. She completely disassociated from reality.”*

– Amelia Tait, “The Complex, Tragic Psychology Behind Animal Hoarding,” *Vice Magazine*, May 7, 2015

**Alienation:** When an **alien colony** is conquered, a piece of the nation is lopped off of the state to which it belongs and appended to the nation-state of the conquering position. The conqueror, whatever the political status of the **alien colony**, inherits the Fundamental Realities of the alien nation to which the population belongs, and those Fundamental Realities, along with all other characteristics of the alien Native Population type (such as planet habitability), will continue to apply to the alien populations no matter where in the universe they live or who controls them.

The conqueror will not be allowed to see the Fundamental Realities that apply to the conquered populations, but will be informed at appropriate times when they can or cannot do something in relation to the conquered population because of the alien Fundamental Realities, and thus the conqueror will eventually become familiar with their alien subjects. Interventions will apply.

- ✓ In the 1980s television mini-series, *Peter the Great* (1986), I recall a striking scene in which the Boyars arrive in traditional dress to petition the Tsar. As they enter court, they see a court – shockingly different from what they expect – modeled after the modern Western European style, as if they had walked into Versailles.<sup>16</sup> They are completely alienated and out of place there, looking obsolete and medieval.
- ✓ Similarly, when the Emperor of Japan recorded a message to be broadcast to the people announcing the surrender of Japan at the end of WWII (the Jeweled Broadcast), the message was spoken in classical court Japanese which could not be easily understood by most of the population.

It is unlikely that Kairotic Moments attached to a conquered planet which is Terra Sancta (see 1 Kairotic Moments, p. 1420, *infra*) would be transferable, and likewise, it is unlikely that Thesis statements (see 2 Reformation, p. 1391, *infra*) of the alien population would have any effect on the new owner; but such are these that there are *too many variables and possibilities* to make an absolute rule. Some odd things might occur in these situations at the judgment of the Concierge.

- **Alien Nation:** When the conquered colony is removed from its previous owner’s Public Space and moved to the conqueror’s Public Space, the population of the planet is alienated

from their own interstellar culture. Thus, *culture and research that were adjacent to or connected to the conquered colony are not transferred to the new owner with the colony (but may be **lost or disrupted**)*. Additionally, Writs, Patents, Colleges, Institutions, and Government Titles of the conquered population are not transferred to or available to the new owner. However, due to the nature of technology, it may eventually be possible to reverse engineer alien technologies found on conquered planets (assuming they survive the battle) with some effort; see 3 Technologies, pp. 712-720, *infra*, for Reverse Engineering procedures.

- ✓ “If the aim of education is to gain money and power, where can we turn for help in knowing what to do with that money and power? Only a disordered mind thinks that these are ends in themselves. Socrates offers us the cautionary tale of the athlete-physician Herodicus, who wins fame and money through his athletic prowess and medicine, then proceeds to spend all his wealth trying to preserve his youth. This is what we mean by a disordered mind. He has been trained in the STEM fields of his time, and his training gains him great wealth, but it leaves him foolish enough to spend it all on something he can never buy.” – John Kaag and David O’Hara, “Big Brains, Small Minds,” *The Chronicle of Higher Education*, May 13, 2016.
  - “Disordered mind” is such a nice, delicate phrase, like if you lived in one of those countries where calling the Dear Leader “crazy” or our Dear Lunatic would get you arrested and tortured until you die, maybe saying he has a “disordered mind” will only get you arrested and tortured until you are crippled for life, as reeducation?☺
- **Monad Imperialism:** An interesting alternative might have been that when an **alien colony** is conquered, instead of simply transferring the colony planet from one Public Space to another (as stated in *Conquered Colony*, 2 Order, p. 539, *supra*), the Monad which the colony occupies is also transferred, thus altering the respective Public Spaces.
  - ✓ In the ‘lopped off’ sense above, it would *\*sort of\** make sense if this happened.
  - ✓ But in another sense, it would be completely absurd as Public Space is not like real estate, rather, it is more generally analogous to (and related to) sensory perception and cognition; that is, owning more real estate won’t let you see farther, hear better, smell new scents or think better. Real estate is material wealth mainly.
  - ✓ Thus ‘monad imperialism’ was not incorporated into GGDM and was in fact, explicitly rejected. However, this discussion does serve to highlight a gray area in the simulation as most people agree that exposure to new ideas, other people, is a critical part of growth, and that isolation is harmful.<sup>17</sup> This is partially handled in *In Spite of Ourselves*, 4 Order, p. 574, *infra*. Thus the exposure to alien culture by conquest and conversion of colonies may change the conquering position in other ways – but not by transfer of Monads. See further (not farther!) discussion, 1 Diplomacy *et seq.*, *infra*.
    - Perhaps ‘holes’ in the Public Space, if allowed, represent psychological or perception blind spots in a species, or in *Dune* (1965) terms: “Try looking into that place where you dare not look! You’ll find me there, staring out at you!” – Paul Maud’Dib to Reverend Mother Gaius Helen Mohiam.

*“Convinced of their technological and methodological superiority over all other peoples, Europeans were starting to question the value of all of the new knowledge if one did not know how to live.”*

– Raymond Birn, Crisis, Absolutism, Revolution: Europe 1648 to 1789 (2<sup>nd</sup> Ed., 1992), p. 169

## Endnotes.

<sup>1</sup> Citation: See Frederick Douglass, “My Bondage and My Freedom,” in *Tribes in the Night Sky*, *infra*.

<sup>2</sup> Commentary: If you think you have heard these last words before, perhaps you may have heard of Robert Heinlein’s famous book about a human raised by Martians who returns to Earth?

<sup>3</sup> Citation: Alternate View: “People who say that slavery had nothing to do with the war are just as wrong as people who say that slavery had everything to do with the war. That was a very complicated civic thing. Robert Tomes, or somebody, once gave the best estimate of the war that I ever heard; he said it was a war of one form of society against another form of society and because one of those forms of society included chattel slavery, and the other side didn’t except to a limited extent, it’s always been identified as a war over slavery.” – Shelby Foote undated audio interview, YouTube “Shelby Foote on the Confederate Flag.”

- ✓ Robert Tomes was U.S. Consul at Rheims, France until 1867. In this analysis, I believe he may have had in mind the war between the English (supported by the Burgundian faction) and Armagnac-controlled France, discussed in 2 Disruption, EN 9, p. 280, *supra*, as a comparator to the American Civil War.

<sup>4</sup> Citation: “The people they passed were a silent, sullen lot. Dull, brutish faces. The faces of slaves and serfs held in bondage by fear and force. These people, Kieron reflected, would go mad in a carnival of destruction if the heavy hand of their lord should falter.... [later] .... Neg was a shambles. The advent of the Valkyrs had been a signal for the brutish population to go mad. Mobs had thronged the streets, smashing, killing and looting. The few Kalgan warriors left behind to guard the city had had to aid the Valkyrs in restoring order.... Shops and houses had been gutted by fire. Goods of all kinds were strewn about the streets, and here and there a body – twisted and dismembered – awaited the harassed burial detachments that roamed the shattered megalopolis.... Along the street of the Black Flames there was nothing left standing whole. Every hovel, every tenement had been gutted and looted by the mobs.” – Alfred Coppel, “The Rebel of Valkyr” (1950).

<sup>5</sup> Commentary: Everyone should be cautious in declaring that their family has never owned slaves. A hundred one generations have passed on the Christian calendar (that is 2020 years divided by 20) and few know where their ancestors were or what they did more than three-generations back (e.g., great-grandparents); this also goes for African-Americans as slavery was not uncommon in Africa *before* the arrival of the Europeans. Thus, African-American ancestors may have owned slaves generations before themselves becoming slaves; there were even reportedly Africans who captured and sold other Africans to Europeans as slaves. Thus, ‘African identity’ was externally imposed.

<sup>6</sup> Commentary: In about March-April 1945, Heinrich Himmler was secretly in contact with Count Bernadotte, head of the Swedish Red Cross, about the possible German surrender and suggested the imminent, impending death of Hitler. Himmler was apparently looking for a situation where Germany surrendered and his remaining SS acted as the police force to keep order (thus, he would remain in power). When Hitler found out, he flew into one of his legendary fits of rage, and declared both Himmler and Göring to be traitors (Göring for an somewhat different reason). Although Himmler’s motives were undoubtedly selfish and self-serving, and he was one of the main architects of the atrocity that was Nazi Germany, viewed through historical hindsight and the inevitability of German defeat in early 1945, and the lens of being on the victorious side of the struggle, it is hard to feel that Himmler committed treason *against* Germany (aside from his crimes against humanity):

- ✓ Did his overtures, as possibly second in the Nazi Government, give comfort and aid to the enemies of Germany? Not likely at that point in time. Rather, he was guilty of insubordination to Hitler, for which he could be legitimately terminated from office in any country, but Hitler was not a person to appreciate such fine lines; rather, he was a ‘traitor’ because in Hitler’s mind, Hitler and Germany were the same entity.

<sup>7</sup> **Citation & Commentary:** In 1542, Holy Roman Emperor Charles V (whose family also ruled most of Spain), promulgated the New Laws as a result of protests against the cruelties committed against and enslavement of the native Americans in Spanish colonies. The local conquistadors resisted:

- ✓ “In 1544, [Lope de] Aguirre was at the side of Peru’s first viceroy, Blasco Núñez Vela, who had arrived from Spain with orders to implement the New Laws, suppress the *Encomiendas*, and liberate the natives from slavery. Many of the conquistadors refused to implement these laws, which prohibited them from exploiting the Indians. Aguirre, however, took part in the plot with Melchor Verdugo to free the viceroy (who had been imprisoned on the island of San Lorenzo), and thus turned against Gonzalo Pizarro (the leader of the anti-viceroy/New Laws faction). After the failed attempt, they escaped from Lima to Cajamarca, and started to gather men to help the viceroy. In the meantime, thanks to the oidor Alvarez, the viceroy had escaped to Tumbes and gathered a small military force in the belief that all the country would rise up to defend the Crown under the royal flag. The viceroy’s resistance to Pizarro and his deputy Francisco de Carvajal, the infamous ‘el demonio de los Andes’ (‘demon of the Andes’) would last for two years until he was defeated in Añaquito on January 18, 1546.” – from Wikipedia article, “Lope de Aguirre.”

Thus, the Old South was not the first to fight for the ‘right’ to enslave. Now, Lope de Aguirre was certainly not a humane character, any loyalties he expressed were pure politics and personal gain. In 1544, he fought to restore the Viceroy of Peru, in 1554 he was wounded fighting against a rebellion, in 1561, he was killed trying to invade Panama after declaring himself “Prince of Peru” in rebellion against the Crown. He also killed his own daughter:

- ✓ “In 1561, he seized Isla Margarita and suppressed any opposition to his reign, killing the governor. When he crossed to the mainland in an attempt to take Panama, his open rebellion against the Spanish crown came to an end. He was surrounded at Barquisimeto, Venezuela, where he murdered his own daughter, Elvira, ‘because someone that I loved so much should not come to be bedded by uncouth people.’ He also killed several followers who intended to capture him. He was eventually captured and shot to death; his body was beheaded and cut into quarters with pieces being sent to nearby towns as a warning.” *Id.*

This, of course, was always the danger: Explorers and conquerors get to the New World, and they think, why do I need to answer to that guy 3,000 miles away? I am here, I can make myself a king! I made this place! That ignorant fat man in Spain knows nothing about the land I have conquered for him. *And this can happen in GGDM.*☺

<sup>8</sup> **Commentary & Citation:** As President Truman said, “There is nothing new in the world except the history you do not know.” Long ago, I read The Lombard Laws (1973), translated by Katherine Fischer Drew, which consists of the edicts of five Lombard Kings from the 6<sup>th</sup> to the 8<sup>th</sup> Centuries (I have not read the companion Burgundian Code) dealing with a large range of topics. The Lombards do not seem to have had the concept of incarceration as a form of punishment, the edicts instead consist of a system of fines, compensation and servitudes, including slavery, or execution or exile for acts against the state. And there I found not much had changed in over a thousand years; the Lombard Edicts deal with such tacky questions as, if a child is born of a slave and a freeman/master, is the child a slave or a freeman? What happens if two slaves are married and another man commits adultery with the slave woman? Compensation to be paid for killing another’s household slave or for injuring field slaves. Slaves being treated as both property (in compensation cases) and persons (in the ability to marry legally before the Lord, which was denied in the slave states in the U.S.), and various stages of confusion in between. This is possibly some acknowledgment in their system that slaves were people reduced to servitude by crimes and poverty or oath-bound, whereas in African slavery, the slaves were captured and brought as cargo to the New World, Europe and India and were solely legal property. Anyway, slavery was a legal problem for the Christian Lombards that consumed a large amount of pages, and was probably the single most frequently addressed subject in Ms. Drew’s translation.

- ✓ The Lombard legal system assuredly created a downward economic trend and increased stratification in their society. It is clear that a freeman could become a slave (or effectively so) in compensation for crimes, for example, Luitprand 84 (727 A.D.) fines a man half his worth as if he had been killed (plus repentance per religious canon) for consulting with a witch or sorcerer, or praying to a tree or performing religious services at a water spring, or failing to report or concealing others who do this. So concerned were they on this issue that there is even a punishment for skirting the law by sending a slave to consult with a witch or sorcerer for the master, and a punishment for the slave who goes to one without permission. Local magnates could easily manipulate the system to reduce certain families to debt slavery.
- ✓ In the logic of the situation, the edict could not say that a slave who was sent to see a witch or sorcerer on behalf of his master could either refuse, or report his master. Rather, the master would be punished.

- ✓ *Incarceration is an institution of a modern world that produces more than is needed, and can afford to punish people without using them as forced labor. The Lombards probably didn't have such a concept, they would not have had people in cages as punishment, consuming food and doing nothing useful.*

<sup>9</sup> Commentary & Citation: In the Andromeda episode “Double Helix,” Tyr Anasazi’s bride, Freya Rajput, expresses the cultural expectation of Nietzschean women that all males are always trying to be Alphas, are constantly plotting and scheming to exert their authority, to gain prestige and prove their genetic superiority. Nietzschean women accept the killing and fighting among men and polygamy practice as the natural way to genetic superiority.

<sup>10</sup> Commentary: In this view, Nazi anti-Semitism was vital in preventing Germany from learning anything from WWI; they simply resumed with fanatical ideological fervor in 1939.

<sup>11</sup> Citation & Commentary: “I’ll move myself and my family aside, If we happen to be left half alive, I’ll get all my papers and smile at the sky, Oh I know that the hypnotized never lie, Do ya?” – The Who, “Won’t get fooled again.”

- ✓ Contemporary Western music of the late 20<sup>th</sup> Century, starting with the Beatles “Revolution” in 1968, produced several anthems exploring the nature of modern violent ideological and radical religious revolutions. Without doubt, The Who’s 1971 “Won’t Get Fooled Again” is the best lyrical description and commentary on the subject. The key quality of an anthem is when the listener feels that no one could possibly do it better. Other honorable mentions include the aforementioned 1985 “Silent Running” by Mike + The Mechanics, and Megadeth’s 1992 “Symphony of Destruction.”

<sup>12</sup> Commentary & Citation: Example, in L. Ron Hubbard’s *Battlefield Earth* (1982), the Psychlos conquered the Earth with a preemptive Strike or Orbital Bombardment Combat (depending on interpretation) that killed 99% of humanity (a minor race). They Landed a small mining colony (making Earth a Balkanized Planet) but never attempted to convert the dwindling humans whom they considered wild savages (a Conquered Colony in GGDM terms). In fact, it was a belated attempt to enslave humans that led to the Psychlos very unlikely demise...

<sup>13</sup> Commentary: The Vandal king Geric, sought marriage of his son into the Imperial Family of the Western Roman Empire, despite the obvious state of collapse overtaking the Empire. Attila the Hun allegedly had the same object in mind. The Mexica/Aztec chiefs sought the same, marriage into existing local aristocratic families, and assimilation into the local priesthood. In Ireland, the Norman conquerors married Gaelic daughters of chieftains and over time, lost their cultural identity (as the English crown slowly lost control beyond the Pale) and their descendants dominated Ireland until the Tudor Conquest and colonization, when they became the “Old English” as opposed to the “New English” settlers (English, Welsh, and Scots).

- ✓ This same pattern has repeated, as conquerors understand the importance of and seek legitimacy among the conquered populations, with some notable exceptions possibly being the Mongol final conquest of China in 1279; the Mongols rejected Confucianism and employed few Chinese elites and bureaucrats. The Mongols were driven out in 1368 by the Ming rebellion, who in turn were overthrown in 1644 by the northern Manchus, who also forbade Manchu marriage to Chinese women and eradicated the Ming elite and aristocracy.
- ✓ Based on the long term experience of the Normans in Ireland (above) and the time periods in GGDM, a Conquered colony that is left isolated for long periods of time by the new sovereign, with no activity, especially if efforts are not made to Convert the colony, might eventually slip from the conqueror’s control, especially so if the position has a Confederation Structural Government Title (see 2 Government Titles, p. 596, *infra*). This could be done by Concierge Intervention, as part of the story or events of the game.

<sup>14</sup> Commentary: Are our dogs and cats ‘naturalized’ to human civilization? Do we make fun of cats and dogs for sleeping most of the day? Actually we do, but not usually in a mean-spirited way, it is not common now (but was in the past) to equate our pets sleeping habits with the capital vice or deadly sin of sloth. Thus, our pets are accepted for what they are, and are not morally judged except by very ignorant people. Modern people understand that is just the way they are naturally, modern science understands that their sleeping habits are related to being predators, storing up kinetic energy needed to catch fleeing prey. We also understand that we sleep (the evolutionary sleep dilemma, a small animal could get killed while sleeping, why sleep instead of simply resting while conscious?) because our brains use more energy than our blood supplies, thus sleep is necessary to replenish our brains.

- ✓ My cats are flatulent and snore, I never snore. Really. I stayed awake all night once listening. I didn’t snore a bit, not one time. Yeah.☺
- ✓ There is a limit to the quality of domestication based on the pet’s phylum and class, non-mammalian or ‘lower order’ Chordates (fish, amphibians, reptiles) are never really ‘domesticated’ (just caged) in the same sense as cats and dogs, with the exception of birds which can approach that level of naturalization to humans. Cats and dogs are clearly our favorites for a reason.

<sup>15</sup> Citation & Commentary: Traveller RPG: The New Era presented some very clever interesting retrospective questions about the Cyberlime chips that, rather than being side issues, were core to the story. The Cyberlime were silicone-based lifeforms who happened to resemble in many ways, computer chips, that were discovered living ‘in the wild’ on a planet within the Third Imperium. Technically, by at least one Emperor’s decree, they were ‘citizens’ of the Imperium by virtue of being natural sophants (as opposed to sophisticated robots, Dave Nilson, Challenge #69), but they were never treated as such, rather, they were used in certain ship technologies and in core processing mainframes throughout the Imperium due to their special properties. They were also susceptible to the AI virus, engineered to target them, that destroyed the Imperium and collapsed interstellar civilization. The lingering question is whether or not by treating them as proper citizens rather than as things, this might have been avoided, and whether the treatment of the Cyberlime was indicative of larger moral-ethical issues in that civilization – similar to slavery. And that brings it back around to the issue of slavery – not whip-cracking slavery – but slavery nonetheless.

- ✓ Traveller RPG was never lacking in deep intellectual material and Traveller RPG: The New Era was cutting edge intellect in the time just before the internet, and just when PCs were becoming ubiquitous artifacts of our civilization. Instead of blithe back stories, such as Skynet in the Terminator movies that were popular then, the Traveller RPG writers in articles and books (e.g., Dave Nilson’s article in Challenge #69) explored the working basis of a technology they could barely imagine (noting however that the 1990s imagined technology development of the Imperium is already looking quaint next to the early 21<sup>st</sup> century possibility of quantum computing and quantum communication satellites – that’s a risk writers take when they write about the future). But as noted previously, intellect doesn’t count for much in the market (especially one aimed at the under-30 crowd), and the failure of Traveller RPG, and of GDW and of most of the rest of the industry, can only be attributed as David Nilson called it, to the “CCG dementia” which sucked the money and intellect out of gaming, and created a new industry giant based on a collectible card game money-milking machine. And sadly, I was a participant in that debacle, playing MTG CCG almost exclusively from about 1992 to 1998; it was cliquish, it was fast and sometimes fun, and always frustrating, which caused you to continue playing and continue spending money on new cards.
- ✓ The divergence of personalities of Cylon copies in the reimagined Battlestar Galactica (2004-2009) owes much to the AI virus in Traveller RPG: “It is useful to think of the virus not as ‘it,’ but as ‘them.’ The [AI] virus is not a single force that behaves in one single stylized fashion. The reason it is so dangerous and successful was that it does not behave in just one way. Each system infected by the virus that has sufficient computing power to allow it to achieve AI becomes its own separate personality, which learns to operate in different ways, and which spreads versions of itself that are subtly different from other virus infections. These offspring are similar to the specific virus that spawned them, but will also mutate in their own directions.” – Dave Nilson, “When Empires Fall II,” Challenge Magazine, Issue 69, February 1993.

<sup>16</sup> Commentary: See the life of Maj. Gen. Abram Petrovich Gannibal, who arrived in Moscow as an African slave in 1704 as part of the *near neurotic* imitation of Western European Courts by the Russian Imperial Court in Moscow.

<sup>17</sup> Commentary & Citation: For the extreme cases of this, search Google for children raised in social isolation. We’ve all heard the stories, e.g., the 12 year old girl found chained to her potty, children chained to beds, kept in the attic, basement, back room, or their bedroom, or caged, never sent to school, never allowed outside. These children suffer socially and mentally in the long term from lack of socialization and impaired mental development:

- ✓ “As argued, socially isolated children are at increased risk of health problems in adulthood. Furthermore, studies on social isolation have demonstrated that a lack of social relationships negatively impacts the development of the brain’s structure. In extreme cases of social isolation, studies of young mice and monkeys have shown how the brain is strongly affected by a lack of social behaviour and relationships (Makinodan, Rosen, Ito & Corfas, 2012). ... The studies described in this text demonstrate the importance of social interaction, and how social isolation damages not only the physiological functions of the body but also the development of the nervous system’s support cells, which in turn affects the development of cognitive functioning. However, there are reasons to believe that the human need for social interaction is not only the risk factor but is also the ‘lifesaving factor.’ As previously mentioned, when the human stress response is activated, multiple stress hormones are activated. One of the hormones that are released has the function to force us into social contact. As the need for social connection is important to everyone, in a vulnerable situation, this contact is so important that our body forces us to socialise.” – “How does social isolation affect a child’s mental health and development?” staff of noisolation.com, updated September 14, 2018.

*“We spend our lives fighting to get people very slightly more stupid than ourselves to accept truths that the great men have always known. They have known for thousands of years that to lock a sick person into solitary confinement makes him worse. They have known for thousands of years that a poor man who is frightened of his landlord and of the police is a slave. They have known it. We know it. But do the great enlightened mass of the British people know it? No. It is our task, Ella, yours and mine, to tell them. Because the great men are too great to be bothered. They are already discovering how to colonise Venus and to irrigate the moon. That is what is important for our time. You and I are the boulder-pushers. All our lives, you and I, we’ll put all our energies, all our talents into pushing a great boulder up a mountain. The boulder is the truth that the great men know by instinct, and the mountain is the stupidity of mankind.” – Doris Lessing, The Golden Notebook (1962)*

**Sisyphean Task:** Every structure, construction project, machine, transit, electronic or telecommunications system, or even generation, added to a civilization places a burden of repair, replacement and upgrade on the current and an unknown number of future generations. Sometimes we forget that, in the politics of the moment, when building new cities, complexes, roads and bridges, traffic systems, and all of the other material objects on which civilization depends. If humanity left the Earth suddenly, with buildings and infrastructure intact but unattended, most visible traces of our civilization would vanish from the surface in a thousand years.

Some maintenance, of necessity, occurs as part of domestic subsistence. Additionally, it would be expected that advancing technology and engineering would also serve to blunt the exponential growth curve of maintenance requirements...

- ✓ Similar to the way that our society is built upon the fact that technology has significantly reduced the percentage of the population that must be employed in farming and food production. The farming population numbers have become alarmingly low, as crop yields have expanded exponentially over the last centuries; with the side effect that most farmland has irrevocably disappeared, converted to suburban development.

But at the same time, systems will continue to become more complex, demanding, precise, powerful, such that something can always go wrong. In addition to the maintenance purpose of the Order Power described below, positions may also develop specific targeted technologies and colleges to reduce, but never eliminate, maintenance.

*“Another flaw in the human character is that everybody wants to build and nobody wants to do maintenance.” – Kurt Vonnegut*

**Maintenance Meeting:** Activation of the Order Power for the purpose of maintenance is an attempt to keep entropy at bay (maintaining low entropic states), specifically, to prevent the wandering random entropic event from landing so hard on your head (or whatever your species has).

While the word “maintenance” invokes images of repairing machinery and roads, and generally upgrading or preserving the civilized infrastructure and military forces, it is also used here to mean the maintenance of civilization in general, and thus extends to education, indoctrination, pageantry, generational transfer of power, justice, population loyalty and a sense of wellbeing, efficient administrative systems, public health systems, and the distribution of wealth.

- ✓ When the HMS Birkenhead struck a submerged rock off Western Cape, South Africa in February 1852 and started to sink, one of the longboats was unable to be lowered because during maintenance, someone had painted the winches, and when the other longboat was lowered to the water, it immediately began sinking. The women and children were placed on three smaller lifeboats while the soldiers remained onboard.
- The Roads Must Roll: When activating the Order Power for the purpose of maintenance, the position may choose to use one, two or three Acts for the activation. Additionally, the position must pledge an amount of RPs, which are immediately removed from the Treasury. A position may not pledge more RPs than are available in the Treasury.
  - ✓ Maintenance Shield Activations costing three Acts will process *after* Taxation Power Activations costing three Acts. This is advantageous.

Maintenance is automatically successful in that the number of Acts committed are multiplied by the number of RPs pledged, and the resulting number is divided by a *random number* determined by the Concierge. The resulting number are Maintenance Shields generated.

Smaller numbers will tend to generate more Shields and higher numbers less Shields. This is no trivial matter, and it is suggested that the Concierge use a standard d4, d6, d8 or d10. The Concierge should be consistent, using the same die for all positions throughout the game, *unless there is some major story reason* why the die might change during the game or why one position might have a radically different die (e.g., Fundamental Reality might get a d20 instead). The Concierge should not inform the players of the die being used or even the results of a specific die roll. There is also room in this process where the Concierge might decide to use a position's Enlightenment to affect a bad die roll, without the permission of the position's players. Also, the Concierge must decide to round fractions up or down.

- ✓ The RPs pledged will be removed from the Treasury immediately when the Maintenance purpose is processed, which could cause other Power Activations to lack funding, so care should be taken to insure there are enough RPs in the Treasury to cover everything. RPs spent on maintenance, unlike Cohering, will never be returned.
- The Old Handyman: Maintenance Shields carryover from turn to turn, and are used to intercept adverse News Events directed at the position and may affect (but not block) Interventions by the Concierge directed at the position. Maintenance Shields do not last indefinitely, there is a 15% chance that each unused Maintenance ♥ will 'age-out' (expire) at the end of every Regular Turn. For each Shield that is eliminated due to aging, there is a 15% chance that in doing so, it will eliminate an Intervention Potential (generally) or reduce an Intervention Potential Plus currently against the position, to a normal Intervention Potential. There is no limit to the number of Maintenance Shields a position may have at any time.
- Hammer Thumb: A position that has at least one Shield has a 50% chance of automatically blocking each adverse News Event – but not a Special Bulletin – and a position may not choose whether or not to block any particular News Event. It is irrelevant whether the adverse News Event would have had no effect (see Red Purge, 3 Dreamtime, p. 161, *supra*), and other positions are never informed if any News Event effect has been blocked by Maintenance Shields. Blocked News Events have no effect on the position, however, one Maintenance Shield is lost for each block. Unblocked News Events do not affect Maintenance Shield.

- ✓ Modifications to News Events are News Events in their own right, see The Modified Truth, *et seq.*, 3 Dreamtime, p. 160, *supra*. Modifications of News Events can be blocked even if the original adverse News Event was not blocked. Similarly, blocking the original adverse News Event does not automatically block the modification News Event. **Patches:** You’ve got to learn the five d’s of dodgeball: dodge, duck, dip, dive and dodge! – from Dodgeball: A True Underdog Story (2004).

- **Blowups Happen:** It is possible that adverse News Events about poor maintenance, civil government failures, counterculture movements might target removal of Maintenance Shields if not blocked by a Maintenance Shield. This creates a situation where the target position loses a Maintenance Shield either way. However, as all positions are equally empowered in News Events, what comes around goes around, and either this warfare will fizzle, or it will turn into a multi-positional fracas of adverse News Events and Maintenance Shields.

Even though a certain percentage of adverse News Events will be blocked during the game (perhaps 30% overall) by Maintenance Shields, the “keep the sand in the sandbox” cautions in 2 Dreamtime, p. 147, *supra*, remain applicable. Players can still wreck the game by excessive, *dues ex machina* News Events, the equivalent of a global thermonuclear war with News Events in GGDM – nobody wins. Additionally, like adverse News Events that constantly target Constructural Elements, the game may grind to a halt because positions are spending activations and RPs every Regular Turn keeping up a Maintenance Shield and still taking hits from 50% of the *dues ex machina* adverse News Events.

- **Crumbling Castles:** Entropy always wins in the end, even gravity does the work of entropy. The underlying principle of maintenance within GGDM is that maintenance will never work to block all adverse News Events and cannot be allowed to prevent Interventions by the Concierge (who exercises game-master judgment). Because die rolls are involved, it is possible to have outlier runs where positions seem impervious and other runs where if it weren’t for bad luck, the position wouldn’t have any luck at all!

It might be possible with extraordinary coordinated maintenance effort between positions to create a ‘bulwark against the night’ and minimize the Concierge intervention in the game short term. Hopefully this is not because players don’t like the Concierge, but personal animosities sometimes push history along. While Interventions are generally regarded as negative events – natural human negativity bias – they don’t need to be adverse.

- **Cheryl’s She-shed Caught Fire:** Maintenance, like Taxation and Census and most other Power Activations, is an ongoing process (competing for resources and attention with other ongoing processes) that happens to be represented by an occasional activation of the Order Power. At the end of any Regular Turn, after the fourth Turn Cycle of the game that a position ends with no Maintenance Shields, the Intervention Potential generated by that position’s Regular Turn becomes an Intervention Potential Plus (IP+) against that position.
  - ✓ If Maintenance Shields remind you of ... antibodies and/or any part of the defense of living matter against foreign bodies – it seems that this is the natural and logical response of any self-amending system, in this universe, to certain types of external entropic events, whether that system is living matter or larger systems constructed by living matter. And it was the natural, required response of the game design to sandbox-participatory universe mechanics.

*“The world thought well of my schoolmaster guardian, because he was neither a liar, nor a scamp, nor a gambler; but he was coarse, avaricious, and ignorant; he knew nothing beyond the confused lessons which he taught to his classes. He imagined that in forcing a youth to become a monk he would be offering a sacrifice acceptable to God. He used to boast of the many victims which he devoted annually to Dominic and Francis and Benedict.”*

– Desiderius Erasmus, as quoted in Life and Letters of Erasmus: Lectures Delivered at Oxford 1893-4 (1899) by James Anthony Froude

**College Tuition:** Long ago, in a business college classroom far away, there was a discussion of why college tuition keeps rising each year if the number of students is not increasing or is, in some cases, decreasing. This ‘long ago’ was back in the early 1990s, a time when, according to the website Statista,<sup>1</sup> annual increase in enrollment in U.S. Colleges had slowed and total enrollment had even decreased slightly, which must have been of great general concern in the higher education industry. Why was college tuition not following the law of supply and demand, that is, if demand for colleges was decreasing, then why were tuitions rising?

The gist of the discussion was to introduce the idea that real estate, structures, appurtenances, personnel, and administrative systems had been extensively developed in colleges throughout the period of the rapidly expanding enrollment up to 1975, when it leveled off and decreased slightly, then resumed slower expansion again after 1980. *Id.* Because the cost of these developments (i.e. structures, both real and social) continued to increase, regardless of the actual enrollment levels or use of the structures, college tuitions would continue to rise predictably as long as the market would support it. The need for the colleges to have the latest, new technology (i.e. PC labs by the mid-1990s) added to the current and future structural costs. Now I am sure there is a name for this argument, and there are criticisms, both of which I am ignorant, and that one might assert that the college instructor was not going to criticize seriously his industry, but the framework of the argument shows the long- and short-term costs of structures and organizations.

Total U.S. college enrollment peaked in 2010 at 21.02 million according to Statista, *Id.* but has steadily decreased, losing 1.18 million by 2016 (19.84 million enrolled). Statista does not project that enrollment will again reach 2016 levels until 2027. But, like the morning sun, tuition will surely keep rising yearly, especially if televised college sports revenues fall off.<sup>2</sup>

- ✓ Think of the alternatives. If college tuitions were capped by the government, then eventually costs might (*might*, if enrollment doesn’t increase) force an overall reduction in the structure of colleges and some colleges might close or less popular majors programs might be pared away. In the short term, this might not seem a bad result, but it runs counter to our idea of a progressive society (see The Bargain discussion, 5 Culture, p. 426, *supra*). There is also probably an argument that it would curtail slightly the process of credentialism, but would also affect education inflation (see Wossamotta U discussion 3 Disruption, p. 287, *supra*), and decreasing educational space might adversely affect minorities in the long term even if tuitions were capped to make college affordable. It’s not a simple problem and doesn’t fit into political slogans. Thus, lower-cost community colleges will continue to fill the entry level higher education role for diversity and social progress.

Thus, Maintenance Shields in GGDM could be considered as conversion of adverse News Events into or representation of adverse News Events (and some Intervention Potentials) as structural costs of civilization. From a position strategy point of view, can players let other positions ‘off the hook’ by not issuing adverse News Events?

*“From its earliest days the power and glory of Rome were derived from a superb military system unmatched in skill or efficiency by any potential enemy. There were many changes in the details of the system in the first 3½ centuries of the Roman Empire: some were normal and evolutionary; others were the result of internal stresses and strains; some were inspired by the example of enemies. The supremacy of the Roman military system – and the continued existence of the empire – was in large part due to the continued pragmatic, logical approach of the Romans to practical problems. They respected tradition but they were not slaves to it, and were extremely flexible in adapting themselves to military change. The fact that there were no more fundamental changes in the Roman military system from about 50 B.C. to 300 A.D., therefore reflects both the lack of technological change in these centuries and the thoroughness with which the Republican Romans had adapted existing technology to the art and science of warfare.*

*Augustus established certain fundamentals of military policy which could not be improved by his successors. The most basic of these was relating the security of the empire to economic soundness as well as military excellence and adequacy. The Roman Empire had become about as large as could be managed by one man or one single administrative system. Armed forces were required only for the defense of the frontiers and to maintain domestic tranquility. Augustus wished to keep the armies as small as possible, in order to place the least possible strain upon the economic fabric of the empire. By organization and skill, a small efficient army could perform the essential defensive missions. The force of 300,000 men under arms was small, in light of the size and the population of the empire (some 50 million) and considering the number of warlike foes around the frontiers. Yet it was adequate.”*

– R. Ernest Dupuy and Trevor N. Dupuy, The Encyclopedia of Military History, 2<sup>nd</sup> Rev. Ed. (1986), pp. 144-145

**Hegemony:** Hegemony always depends on the *what*. The larger the defined area or system over which one has hegemony, the greater and at the same moment, less certain, is the hegemony. Only ocean-spanning technology – acting as a force and reach multiplier – has allowed for global hegemony beginning in the late 17<sup>th</sup> Century. All previous empires have established hegemony over the areas they could reach and to whatever extent they could affect events, circumstances and actions beyond their borders: The Romans had no sphere of influence in China.

- ✓ “The boundary has special significance in systems theory as it, by definition, separates the system from its environment. In so doing, it effectively defines and operationalizes the system. The significance of the boundary for both intra-system relations and inter-system relations cannot be overstated. The principles of self-reference (see Luhmann, 1995; Bailey, 1997) are clearly relevant for boundary analysis in the sense that once a boundary is established, the system references that boundary in virtually all of its future actions, both internal and external.” – Kenneth D. Bailey, “Boundary Maintenance in Living Systems Theory and Social Entropy Theory,” *Systems Research and Behavioral Science*, Vol. 25, Is. 5, pp. 587-597, January 7, 2009.

Defining the bounds of a system is not as easy as it would seem and less clear than this game presents. For example, one popular interpretation of the results of the two World Wars was that hegemony shifted to the West – that *Pax Americana* succeeded *Pax Britannica* as the global hegemon and constabulary in the 20<sup>th</sup> Century. Or at least, that hegemony had shifted away from Western Europe, as the United States and the Soviet Union faced off in the Cold War. Or as one pundit said, ‘Russia no more got to be a superpower by merely defending its borders than a rich man got to be rich by being robbed.’ Hegemony is aggression.

This provincial view works if and when humanity is not viewed as a global civilization; it works in the state theory of international relations where each nation is a sovereign and distinct bundle of systems and pieces of civilization. If, however, the entire human civilization on Earth is viewed as a singular system, a global view – as it would in the game be a single position with a Homeworld (i.e. Earth) Primal State and a distinct Native Population Type (i.e. humans), then the term “hegemony” would no longer seem suitable; and the results of the two World Wars might better be described as a cultural shift or a relocation of the nexus of the systems from one part of the globe to another, not a hegemonic shift. Hegemony then, is the word that we use only vis-à-vis things *outside* the system, *us and them*.

For game purposes, each position, in the beginning, is considered a separate and closed system. Whether or not one position has hegemony in the game, or whether the concept is even applicable, depends on how the players play the game. Within each position, it may be deemed that there are systems within systems (for example, each colony must be a sociocultural, sociopolitical system); later, as positions expand, explore and interact, it might appear that the positions collectively, have formed or begun a new larger system of interstellar civilization.

- ✓ “At present we are paying eight millions a year for the privilege of living on an ungrateful volcano out of which we are in no circumstances to get anything worth having.” – Winston Churchill, 1922, as Colonial Secretary, regarding Iraq.
- Hegemonic Empires: Human civilization *owes much* to hegemonic states and causes, early hegemonic empires served (for their own selfish purposes) to increase complexity of organization and social interaction, forced cross-cultural exchange, centralized economy, invented currency, and displaced population leading to genetic dispersion and improved travel.
  - ✓ This is a central mystery, paradox of human civilization: That conflict and warfare have somehow been generative in the long term, exceeding the short term entropic effects. That is, emergent effect over time from sociopolitical entropy. It is the ‘natural experiment’ of history, it cannot be ignored, and has not yet been wished away.

Early empires, from the first city states to classical antiquity (and Mesoamerica before the arrival of the Spaniards), seem to have been hegemonic empires – that is, conquered peoples were allowed to keep their leaders and local culture, language, customs, religion (unlike the Spaniards), but were simply required to acknowledge the hegemony of the conquerors by paying tribute, providing brides, and sometimes military forces to the conquering tribe.

- ✓ “Before Cyrus the Great there had been no high art of conquest. The Assyrians knew how to win victories, but their brutal and senseless warfare raised up an inverted pyramid, a structure sure to topple from the weight of oppression. Cyrus, in contrast, erected a temple of military statecraft in which the vanquished were free to retain such customs, prejudices and beliefs as did not interfere with the payment of tribute.

Cyrus even paid the vanquished the tribute of adopting their various forms of religious worship, as if wishing to offend neither his new subjects nor their gods. In proof of his policies, the Persian Empire had managed to survive two centuries of generally weak successors to the throne.” – Lynn Montross, *War Through the Ages* (3<sup>rd</sup> Ed., 1960), p. 24, cf. ‘empty-handed’ feature quote, top 1 Colleges, p. 454, *supra*.

A fictional example of the Assyrian style of conquest is the basis of the film *Conan the Barbarian* (1982) when the roving band of raiders surprised and massacred an entire plains village for no reason, looted it, and took the children to be sold as slaves. The bad guy bandit leader, of course, appears later as the leader of a nihilistic cult threatening the king (perhaps a fictionalized reflection of Alexandria about 195 A.D. as portrayed in the film *Agora* (2010)) who sends the stupid barbarian to destroy the cult and free his daughter.

- ✓ The *Twilight Zone* episode “The Old Man in the Cave” (1963) provides another fictionalized version of this. A group of perhaps 20 survivors (with perhaps 3 horses) live an absurd existence in a small town that appears to have been sheltered in the mountains from the thermonuclear war that destroyed the rest of civilization ten years earlier. A group of four men in army uniforms, a major, staff NCO and two lower enlisted soldiers, with rifles arrive in the town in a military jeep that still works and has fuel. They claim to be from the “Central States Command” and are going about reorganizing and uniting the country. The town leader doesn’t believe them, and the major later admits that there are less than 500 people left alive between New York City and Atlanta, making his story highly unlikely. The major claims to be college educated and the story seems to bear this out, he may have been an officer before the war, he may even be the highest ranking legitimate officer left in the non-existent U.S. armed forces, but instead, he uses brutality when his ruse doesn’t work, he displays a kind of canniness in exposing the fraud to wrest control of the group, but ultimately his brash stupidity results in everyone dying from eating poisoned food.

Hegemonic empire boundary expansion is usually halted by their own internal political struggles, many successful commanders have been assassinated or executed by grateful but suspicious, jealous rulers. The smashing victory of Gnaeus Julius Agricola and the Roman army (with Romanized local auxiliaries) over the numerically superior Caledonian Confederation army in North-Eastern Scotland in 83 A.D. at the Battle of Mons Graupius resulted in no long-term gain for the Roman Empire. It is said that he was recalled to Rome and rewarded shortly afterward, his conquests halted because they overshadowed Emperor Domitian’s lackluster results in campaigns he personally commanded along the Rhine against the Germanic Chatti tribe in the same year. The attack on the Chatti was considered unprovoked, unnecessary and a mock triumph for the Emperor who sought military glory to secure his throne, thus, Agricola’s authentic successes against the Caledonians were a political threat.

This is symptomatic of the Roman problem, and of the problems of many hegemonic empires before and since, that internal politics nullifies successful expansion and battlefield victories. Within a few years, the Romans were drawing troops from Britain, and slowly retreated from Caledonia (i.e. Scotland) and northern England until Hadrian’s Wall was constructed in 122 A.D., and for their part, the Germanic Chatti gained 75 km of roads constructed by the legionnaires in the Emperor’s campaign of 83 A.D. and probably had some vengeful part in The Revolt of Saturninus six years later in 89 A.D.

The later addition of *intolerant extremism* to hegemonic concepts, which seems to coincide in the West with the demise of the Western Roman Empire, and later in the Middle East with the rise of Islam, *transformed conquest from political and military hegemony to cultural hegemony* by the forced conversion and imposition of religion. In the 19<sup>th</sup> and 20<sup>th</sup> Centuries, the cultural hegemony drive in Europe and elsewhere was transferred to ultra-nationalism.

- ✓ Ultra-nationalism is a kind of cultural self-intoxication; like a drunk man at a bar who jumps up on a table and challenges everyone to a fight (are you hearing Hank Williams, Jr.'s song "Attitude Adjustment" (1984) in your head?), the Axis powers thought they could fight the whole world and win. The registration of *Volksdeutsche* (sometimes mandatory or frequently under coercion) in Eastern areas captured by the Germans in WWII was more about convincing themselves that they were liberators and protectors than it was about convincing the world. As long as ultra-nationalism exists (especially of the imperial or fascist kind) there is always the possibility of the same thing happening on a similar or smaller scale (except for the problem of nuclear weapons...), it has happened many times already since the end of the Cold War.
  - Ultra-nationalism often contains or uses romantic nationalism, ethnic nationalism, and national mysticism. See Romantic Nationalism discussion 3 Government Titles, p. 618, *infra*.

Extremism may seem natural to the participants of the game because it has been built into our culture; it has become virtuous, in many cases being confused with piety, purity, patriotism, dogmatism, dedication, and commitment. The participants of the game, the Concierge in particular, may note various types of hegemony and make judgments accordingly regarding, for example, Social Titles, Balkanization, forced emigration, and Naturalization of colonies.

- Hegemonic Frontier Potentials: After the independence of the colonies was established, the Spanish and English recognized the vast westward expansion potential of the United States and attempted – ineffectively – to thwart the growth of the new nation. The English backed a confederation of Native American tribes hoping to stop expansion into Ohio and along the Great Lakes (the Northwest Indian Wars), while the Spanish engaged in diplomacy and espionage (see the Burr Conspiracy for example). Ultimately, Europe was always consumed with its own wars and rivalries (in this instance, the French Revolution and the Napoleonic Wars), while the United States Navy began to assert global power by first defeating the Barbary Pirates (to which the U.S. and other European powers had paid tribute for decades) and then holding off the British Navy during the War of 1812.
  - ✓ “A night telephone call from Ribbentrop. He is overjoyed about the Japanese attack on America. He is so happy about it that I am happy with him, though I am not too sure about the final advantages of what has happened. One thing is now certain, that America will enter the conflict and that the conflict will be so long *that she will be able to realize all her potential forces*. This morning I told this to the King who had been pleased about the event. He ended by admitting that, in the long run, I may be right. Mussolini was happy, too. For a long time he has favored a definite clarification of relations between America and the Axis.” – Diary of Galeazzo Ciano, Foreign Minister of Italy (1936-1943) (emphasis added), cited in Wikipedia article.

Galeazzo Ciano was the son-in-law of Benito Mussolini, who had him executed in January 1944 for *treason* for voting against him in the Fascist Grand Council meeting in 1943.

Ciano's father was an Italian admiral, a corrupt government minister who amassed wealth and the title of Count, and one of the founders of the Italian National Fascist Party. Minister Ciano, already doubtful about the whole adventure and not pleased about the Germans, understood that one might be careful what they wish for in war, and events quickly proved him correct. Galeazzo Ciano's diary is one of the most important day-to-day records of a Minister in WWII, and was used at the Nuremberg Trials.

One certainly wonders at Ribbentrop's joy and how long it lasted. The United States declared war on Germany and Italy on December 11, 1941, Germany surrendered May 7, 1945, 3 years, 4 months, and 26 days later. Ribbentrop probably thought that the war with Japan would consume and distract the U.S., who would not be able to effectively prevent Germany from winning; if so, he failed to grasp the full potential of the youthful United States. On November 8, 1942, less than a year after Pearl Harbor, the U.S. landed forces in North Africa in the rear of the Axis forces, dooming their North Africa campaign (the Axis forces retreated from El Alamein a few days earlier), and leading to the invasion of Sicily seven months later.

- ✓ “To fear the world we have organized and led for three-quarters of a century, to abandon the ideals we have advanced around the globe, to refuse the obligations of international leadership and our duty to remain ‘the last best hope of earth’ for the sake of some half-baked, spurious nationalism cooked up by people who would rather find scapegoats than solve problems is as unpatriotic as an attachment to any other tired dogma of the past that Americans consigned to the ash heap of history.” – Sen. John McCain, remarks at the Liberty Medal Ceremony, October 16, 2017.

In the opening to Star Trek, Captain Kirk says that space is the final frontier; he could have said that space is the final endless frontier. There are so many stars in our arm of the galaxy alone (along with potentially millions of exoplanets, tens of thousands within 100 LY) that interstellar civilization such as those in GGDM, unless they choose not to, can have an endless ‘Western frontier’ out in space; to have endless hegemonic potential.

- ✓ See exploration ‘looking’ discussion, 2 Expansion generally, *infra*.

---

**King Osaric:** *There comes a time when the jewels cease to sparkle, the gold loses its luster, when the throne room becomes a prison. All that is left is a father's love for his child. – Conan the Barbarian (1982)*

---

**In Spite of Ourselves:** At the end of any Regular Turn in which a position Converted a Conquered Colony, there is a 1% chance, plus 2% per Converted Colony and 3% per Naturalized Colony owned by the position that a Monad will be added to the position's Public Space adjacent to the location of the colony. A Monad may also be gained each time a colony is Naturalized as above, but the base chance increases to 3% plus modifiers. Additionally, 1% is added to either for every three units currently in *apostasy*. This is an intentional ‘snowballing’ mechanic.

As the edges of the Public Space wrap around to meet, see Edge of Reality, 4 Writs, p 452, *supra*, players should be cognizant that they are actually just inserting Monads into a circle rather than expanding a flat plane. Thus, they may inadvertently push things on the Public or Diplomatic Space out of adjacency; Pathways may need adjusted, pieces moved or removed. This is the cost of empire.

*“Many singletons could co-exist in the universe if they were dispersed at sufficient distances to be out of causal contact with one another. But a terrestrial world government would not count as a singleton if there were independent space colonies or alien civilizations within reach of Earth.”*

– Nick Bostrom, “What is a Singleton” (2005) (available on his website) <sup>3</sup>

**Spheres of Influence:** To a significant degree, play of GGDM is about ‘Spheres of Influence’ or ‘Spheres of Power.’ The hegemonic empire victory in GGDM is reflected in the Objective Victory Criterion in Victory in Space, 1 Resolution, p. 1459, and Objective Measures of Victory, p. 1470, *infra*. It is also very much a part of the diplomacy of the game. Objective Victory Criterion is only one part of the endgame accounting, and is not the final word in any game.

The ancient kingdom of Armenia, which was almost always within the sphere of one or more empires, was ruled in large part by Chinese descended or exiled aristocratic families, the Mamikonian dynasty, from the 4<sup>th</sup> to the 8<sup>th</sup> centuries A.D. The Romans, Greeks, Persians, Sassanids, Parthians, all invaded or intervened in Armenia over several centuries. I recall reading somewhere – and I cannot now locate the reference – of an exiled Chinese Prince who crossed into Armenia with up to 5,000 horsemen in or about the same time the Roman forces or their proxies may have been operating in Armenia.<sup>4</sup> I thought this would be a great what-if historical tabletop miniatures game, Chinese horsemen vs. Romans in Armenia (why I remembered). Thus the ancient Roman and Chinese cultural-political spheres showed some edge overlap in Armenia.

- ✓ “While interest in trade would have accounted for the vast majority of reasons to interact, was that all it came down to? ... But some historians seem to believe there were even more complex interactions, even intermarriage and warfare. Regarding warfare, while there certainly was never a war between Rome and China, some historians have speculated that Roman soldiers captured in the Battle of Carrhae around 53 B.C. made their way eastward as Persian slaves where later they were put into the service of the Zhan-nu armies fighting against the Chinese. Chinese sources indicate that some foreign soldiers fighting in the Battle of Zhizhi formed a strange fish scale formation, possibly the infamous Roman *testudo* formation. Historian Homer H. Dubs even went on to suggest that these soldiers settled in eastern Asia, though historical and genetic evidence is less supportive of this having occurred and the foreign soldiers at Zhizhi were uncertain to have been Romans. Some suggest that they were Greek descendants of Alexander’s Empire, but they may not have been Europeans or Near Easterners at all.” – Justin [Narrator], “Did Rome and China Know Each Other?” YouTube video by Fire of Learning, posted February 22, 2019.

The Battle of Zhizhi occurred in 36 B.C., 17 years and half a world away from Carrhae, if the foreign soldiers were Roman Legionnaires, they were a bunch of tired old dudes!

The subject of Sino-Roman interaction has strong fascination for some, for example, the Daily Telegraph reported in 2010 on a village in China where “Genetic testing of villagers in a remote part of China has shown that nearly two thirds of their DNA is of Caucasian origin, lending support to the theory that they may be descended from a ‘lost legion’ of Roman soldiers.” (Nick Squires, “Chinese villagers ‘descended from Roman soldiers’” Daily Telegraph, November 23, 2010). The article also contains a quote from Maurizio Bettini of Siena

University (Professor of Classical Philology) calling the Roman soldiers theory a “fairy tale.” So there is still academic skepticism, both East and West, and Homer Dubs’ theory regarding the county of Liqian have been savagely attacked for lack of evidence and plausibility.

- ✓ “The 10,000 Roman prisoners of war appear to have been deported to Alexandria Margiana (Merv) near the eastern border in 53 BC, where they reportedly married to local people. It is hypothesized that some of them founded the Chinese city of Liqian after becoming soldiers for the Xiongnu in the Battle of Zhizhi against the Han dynasty, but this is disputed.” – from Wikipedia article, “Battle of Carrhae,” captured April 30, 2019.

The overlapping of spheres went both ways and included more than silks and soldiers:

- ✓ “It is not clear how much these interactions may have been influential, but authors like Robert Linssen have commented that Buddhism may have influenced Western thought and religion at that time. Linssen points to the presence of Buddhist communities in the Hellenistic world around that period, in particular in Alexandria (mentioned by Clement of Alexandria), and to the pre-Christian monastic order of the Therapeutae ... who may have ‘almost entirely drawn (its) inspiration from the teaching and practices of Buddhist asceticism’ and may even have been descendants of Aśoka’s emissaries to the West. Philosophers like Hegesias of Cyrene and Pyrrho are sometimes thought to have been influenced by Buddhist teachings. Buddhist grave-stones from the Ptolemaic period have also been found in Alexandria, decorated with depictions of the Dharma wheel. The presence of Buddhists in Alexandria has even drawn the conclusion that they influenced monastic Christianity. In the 2<sup>nd</sup> century CE, the Christian dogmatist, Clement of Alexandria recognized Bactrian śramanas and Indian gymnosophists for their influence on Greek thought.” – from Wikipedia article, “History of Buddhism,” April 30, 2019.
  - This refers to Alexandria in Egypt, as Clement of Alexandria lived there from about 180 to 202 A.D., when he was forced to flee. This is not to be confused with Alexandria of the Caucasus, which was a Hindu Kush stronghold of Indo-Greek kings, and a Buddhist center for missions.

Genes will flow where the silk goes!

*“New World societies had just begun making bronze artifacts and had not yet started making iron ones at the time when the arrival of Europeans truncated the New World’s independent trajectory.” – Jared Diamond*

---

**Invading Timelines:** Ethnic nationalism, dynastic ambitions, religious conflict, colonialism, industrialization, population density, migration to the New Worlds, political revolution, excess resources and wealth, and technology – always present in various combinations in any era or situation – has shaped European history (and much of world history in ripples across the globe) for the last 500 years.

This is the problem with criticisms of Western history as being ‘Eurocentric’; quite simply, it is a fact that the history of the world, in large part, for the last 500 years is Eurocentric. The Europeans invaded everyone else’s history and altered their cultural and political trajectories.

- ✓ “Millenarianism has been found through history among people who rally around of-ten-apocalyptic religious prophecies that predict a return to power, the defeat of ene-mies, and/or the accumulation of wealth. These movements have been especially common among *people living under colonialism or other forces that disrupt previous social arrangements*. The phrase ‘millennialist movement’ has been used by scholars in anthropology and history to describe the common features of these religious phe-nomena when viewed as social movements, and has most often been used to describe the social movements that have taken place in colonized societies. Christianity itself can be seen as originating in a millenarian movement among Jewish people living un-der Roman rule, *although its characteristics as a social movement quickly changed as it spread through the Roman Empire.*” – from Wikipedia article, “Millenarianism in colonial societies,” captured June 14, 2019 (emphasis added).
  - See also The Core of Christianity, 1 Kairotic Moments, p. 1423, and Cattle Killing Movement, 2 Wheels in the Sky, p. 1488, *infra*.

*“Ethno-racial nationalism is an enormously potent political force; wise politi-cians know this and employ it cautiously. Nationalism arouses genuine pas-sion and is a political motivator like no other... Moreover, once nationalism becomes the main political factor, there’s no putting that troublesome genie back in the bottle.*

*Politics become tribal, ethnic conflicts waged at the ballot box rather than on the battlefield.... the fires of nationalism, once stoked, are only put out with great difficulty – and ... ethnically diverse societies that play games with na-tionalism are living dangerously. Nationalism transforms politics from ideol-ogy to tribe.... The power of nationalism ought never be underestimated. Ger-man nationalism in the first half of the last century was so potent that it took two world wars – at the cost of ten million dead Germans, most of their cities flattened, plus major territorial losses and decades of foreign occupation – to finish it off as a political force.”*

– John R. Schindler, “America’s Emerging Nationalism Crisis,” The Observer, November 14, 2016

<sup>4</sup> Citation: See S.A.M. Adshead, China in World History, 3<sup>rd</sup> Ed. (1999-2000), pp. 34-35, found on Google Books, which seems to reference this same event, and also that the Chinese may have captured Roman POWs stationed by the Parthians on the Old Silk Road who then married Chinese women.

## Martin Luther

### Luther and Calvin on Secular Authority

If anyone attempted to rule the world by the gospel and to abolish all temporal law and sword on the plea that all are baptized and Christian, and that, according to the gospel, there shall be among them no law or sword - or need for either - pray tell me, friend, what would he be doing? He would be loosing the ropes and chains of the savage wild beasts and letting them bite and mangle everyone, meanwhile insisting that they were harmless, tame, and gentle creatures; but I would have the proof in my wounds. Just so would the wicked under the name of Christian abuse evangelical freedom, carry on their rascality, and insist that they were Christians subject neither to law nor sword, as some are already raving and ranting.

To such a one we must say: Certainly it is true that Christians, so far as they themselves are concerned, are subject neither to law nor sword, and have need of neither. But take heed and first fill the world with real Christians before you attempt to rule it in a Christian and evangelical manner. This you will never accomplish; for the world and the masses are and always will be unchristian, even if they are all baptized and Christian in name. Christians are few and far between (as the saying is). Therefore, it is out of the question that there should be a common Christian government over the whole world, or indeed over a single country or any considerable body of people, for the wicked always outnumber the good. Hence, a man who would venture to govern an entire country or the world with the gospel would be like a shepherd who should put together in one fold wolves, lions, eagles, and sheep, and let them mingle freely with one another, saying, "Help yourselves, and be good and peaceful toward one another. The fold is open, there is plenty of food. You need have no fear of dogs and clubs." The sheep would doubtless keep the peace and allow themselves to be fed and governed peacefully, but they would not live long, nor would one beast survive another.

For this reason one must carefully distinguish between these two governments. Both must be permitted to remain; the one to produce righteousness, the other to bring about external peace and prevent evil deeds. Neither one is sufficient in the world without the other. No one can become righteous in the sight of God by means of the temporal government, without Christ's spiritual government. Christ's government does not extend over all men; rather, Christians are always a minority in the midst of non-Christians. Now where temporal government or law alone prevails, there sheer hypocrisy is inevitable, even though the commandments be God's very own. For without the Holy Spirit in the heart no one becomes truly righteous, no matter how fine the works he does. On the other hand, where the spiritual government alone prevails over land and people, there wickedness is given free rein and the door is open for all manner of rascality, for the world as a whole cannot receive or comprehend it.

## King Charles I of England

### Defense Speech at Trial, January 1649

I would know by what power I am called hither ... I would know by what authority, I mean *lawful*; there are many unlawful authorities in the world; thieves and robbers by the high-ways ... Remember, I am your King, your *lawful* King, and what sins you bring upon your heads, and the judgement of God upon this land. Think well upon it, I say, think well upon it, before you go further from one sin to a greater ... I have a trust committed to me by God, by old and lawful descent, I will not betray it, to answer a new unlawful authority; therefore resolve me that, and you shall hear more of me.

I do stand more for the liberty of my people, than any here that come to be my pretended judges ... I do not come here as submitting to the Court. I will stand as much for the privilege of the House of Commons, rightly understood, as any man here whatsoever: I see no House of Lords here, that may constitute a Parliament ... Let me see a legal authority warranted by the Word of God, the Scriptures, or warranted by the constitutions of the Kingdom, and I will answer.

It is not a slight thing you are about. I am sworn to keep the peace, by that duty I owe to God and my country; and I will do it to the last breath of my body. And therefore ye shall do well to satisfy, first, God, and then the country, by what authority you do it. If you do it by an usurped authority, you cannot answer it; there is a God in Heaven, that will call you, and all that give you power, to account.

If it were only my own particular case, I would have satisfied myself with the protestation I made the last time I was here, against the legality of the Court, and that a King cannot be tried by any superior jurisdiction on earth: but it is not my case alone, it is the freedom and the liberty of the people of England; and do you pretend what you will, I stand more for their liberties. For if power without law, may make laws, may alter the fundamental laws of the Kingdom, I do not know what subject he is in England that can be sure of his life, or anything that he calls his own.

I do not know the forms of law; I do know law and reason, though I am no lawyer professed: but I know as much law as any gentleman in England, and therefore, under favour, I do plead for the liberties of the people of England more than you do; and therefore if I should impose a belief upon any man without reasons given for it, it were unreasonable ... The Commons of England was never a Court of Judicature; I would know how they came to be so.

It was the liberty, freedom, and laws of the subject that ever I took – defended myself with arms. I never took up arms against the people, but for the laws ... For the charge, I value it not a rush. It is the liberty of the people of England that I stand for. For me to acknowledge a new Court that I never heard of before, I that am your King, that should be an example to all the people of England, for to uphold justice, to maintain the old laws, indeed I do not know how to do it.

This many-a-day all things have been taken away from me, but that that I call more dear to me than my life, which is my conscience, and my honour: and if I had a respect to my life more than the peace of the Kingdom, and the liberty of the subject, certainly I should have made a particular defence for myself; for by that at leastwise I might have delayed an ugly sentence, which I believe will pass upon me ... Now, sir, I conceive that an hasty sentence once passed, may sooner be repented of than recalled: and truly, the self-same desire that I have for the peace of the Kingdom, and the liberty of the subject, more than my own particular ends, makes me now at least desire, before sentence be given, that I may be heard ... before the Lords and Commons ... If I cannot get this liberty, I do protest, that these fair shows of liberty and peace are pure shows and that you will not hear your King.

### **Judge Bradshaw's Response**

There is a contract and a bargain made between the King and his people, and your oath is taken: and certainly, Sir, the bond is reciprocal; for as you are the liege lord, so they liege subjects ... This we know, the one tie, the one bond, is the bond of protection that is due from the sovereign; the other is the bond of subjection that is due from the subject. Sir, if this bond be once broken, farewell sovereignty! ... These things may not be denied, Sir ... Whether you have been, as by your office you ought to be, a protector of England, or the destroyer of England, let all England judge, or all the world, that hath look'd upon it ... You disavow us as a Court; and therefore for you to address yourself to us, not acknowledging us as a Court to judge of what you say, it is not to be permitted. And the truth is, all along, from the first time you were pleased to disavow and disown us, the Court needed not to have heard you one word.

*“What is government itself but the greatest of all reflections on human nature? If men were angels, no government would be necessary. If angels were to govern men, neither external nor internal controls on government would be necessary.” – James Madison, Federalist Papers No. 51 (1788) <sup>1</sup>*

**Title Search:** “Title” in English usage has two primary senses. A title can be what something is called (a book). Title is also ownership of a thing, and all of the bundle of ownership rights that accompany ownership of a land or chattel. In sort of a combination of the first two, a title can also be given to or inherited by a person, or merely used as a matter of formal courtesy, indicating their position or preeminence or office in society. Such titles are often used to indicate adulthood, household position, nobility, knowledge, certification, or elected, inherited or appointed office. A title may also be earned, won, for example, a batting title in baseball or a boxing title.

Title in any sense, inherently indicates an inequality. If you own it, you have the right to exclude others from using it. If something is called by a title, then that thing is identified solely with that title, and no other can (or should) have the same identity. If someone earns a title, as through competition, they are the best, better than the rest. If someone is called by a title, or given a title, such a title indicates a distinction or superiority (especially when capitalized or preceded with “the,” such as the Concierge) socially and institutionally over someone who does not have that same title. Occasionally titles are given in derision. In any form, titles are about power, socially sanctioned and recognized power in distinction, exclusivity, status, peerage, honors, infamy.

- **Staking Your Claim:** The concept of GGDM Government Titles is not merely an exercise in abstract theory; think for a moment of what you claim to be in our world, what takes up the significant part of your waking time? Are you a student, professional, parent, spouse, son, brother, sister, charity worker, sports fan, animal friend, philanthropist, ‘blue collar man,’ ‘workaholic,’ drunk, felon, junkie, movie critic, geek, evangelist, activist ... these are your personal titles that externally define your place in our society and the structure of your life. And they carry with them certain external and internal legitimacy requirements; can someone claim to be a drunk (or be called a drunk) when they haven’t drank any alcohol in ten years (notice that AA always says, “recovering alcoholic”)? Presumably a student is actively engaged in receiving formal education (thus collegiate athletes must (theoretically) actually be students in good standing at the institution to which the team belongs) and a parent cares for children, and a spouse has a spouse with whom they carry on their primary intimate relationships, all of which suggest a required pattern of behavior maintaining their legitimacy.

Government Titles are for convenience in the game, an artifice like inactive Constructural Elements. It’s all a bit relative depending on which way you want to slice the cake. For example, the people of the Middle Ages did not think of themselves as living in the Middle Ages; the term was invented by Renaissance thinkers to describe the middle period between the end of the Western Roman Empire (i.e. the end of classic antiquity) and their own time. We have been stuck with the term since then. Similarly it has been pointed out that the concept of the ‘feudal system’ is a later invention of the 18<sup>th</sup> Century to retroactively describe (some claim inaccurately) the relationships and society of Medieval Europe (‘feudal’ first appeared in in English in 1602 according to Merriam-Webster online dictionary, is thus, retroactive).

- ✓ Most nations that have ‘democratic’ in their title are not (e.g., Democratic People’s Republic of Korea); in Babylon 5, the Centauri Republic was ruled by the Emperor.

*“Member worlds of the Imperium agree to pay taxes and obey a few fundamental laws which the Imperium promulgates, known as the High Laws.... In return, the Imperium agrees to patrol the space between the worlds, to protect interstellar trade, to encourage travel and commerce, and to arbitrate diplomatic relations between worlds. Beyond this, individual worlds are left to their own devices so long as they acknowledge the power of the Imperium to rule the stars.”*

– Traveller RPG Wiki, “Third Imperium,” captured June 10, 2018

**The Power That Preserves:** Governments, by whatever means they are constituted, secure authority over a territory, define the state’s borders, and represent the authority of the state to act. A nation without a centrally constituted authority (that is, a state) is like a body without a head. Inevitably, for reasons good or ill, someone or some group gathers the power to themselves, imposes their will upon others, and is eventually forced to assume the mantle of the state, if only to protect their own selfish interests.<sup>2</sup> In this game, the mantle of central authority is represented by the sole and unique ability of Government Titles to activate the vital Powers; lacking any undisrupted Government Titles, a position cannot activate any Powers, and is thus unable to act.

- ✓ “The central planets formed the Alliance and decided that all worlds should unite under their rule. There was some disagreement on that point... After the Unification War, many of the Independents who had fought and lost drifted to the edges of the system, far from Alliance control.” – part of Firefly opening narration.
- ✓ The Power that Preserves (1979) is the title of the third book in the Chronicles of Thomas Covenant, the Unbeliever by Stephen R. Donaldson.
- The Singleton: The presentation of Government Titles in the game for the purposes of Power Activations and other game functions is an illusion of unity necessary for the function of the game position. That is, it is vaguely assumed that each position enters the game with a global government (possibly what Nick Bostrom calls a ‘singleton,’ *ut infra*) or a binding arrangement between sovereign authorities that functions as a centralized command.<sup>3</sup>
  - ✓ **Kate:** The incursion protocols have been agreed internationally. In the event of full-scale invasion, an Earth President is inducted immediately, with complete authority over every nation state. There was only one practical candidate.
  - ✓ **Dr. Who:** That’s your answer for everything, isn’t it? Vote for an idiot.
  - ✓ **Kate:** If you say so, Mister President. So long as you’re on this plane, you’re the Commander in Chief of every army on Earth. Every world leader is currently awaiting your instructions. You are the Chief Executive Officer of the human race. Any questions? – Dr. Who, “Death in Heaven” (2014).

In no case is government considered to be *monolithic structures* even for purely game functions; there is always room for entropy, mischief between competing political factions, cultures, social strata, classes. Thus, *Intervention Potentials* are generated each Regular Turn.

- ✓ [Host David S.] “It is easy to then fall into the trap that from that point to the fall of the Berlin Wall 40 years later, that all members of East German society were firm and loyal supporters of the Communist SED government. Or, at least, that there wasn’t tremendous opposition to the SED.” – from “East German Rebellion 1953 – COLD WAR DOCUMENTARY,” YouTube Cold War Channel, February 1, 2020.

- ✓ The common impression of Middle Ages Europe was a uniform, though slightly variable feudal arrangement, for at least 500 years. And that may be represented by one or more Government Titles in GGDM. But there were areas that understood what was happening and resisted, for example, the independent peasant’s Republic of Dithmarschen resisted conquest and feudal imposition before succumbing late in the period. When the Fourth Crusade conquered Constantinople, the Latin Empire immediately weakened itself by dividing into a Western feudal arrangement which was represented by the new subjects and immediately fell into the usual petty feudal bickering.
  - ✓ “It is high-minded, self-deluding fatuousness to claim that any race has one immutable spiritual trait, and that race acts with one mind as one unified body.” – Dave Nilssen, “When Empires Fall II,” Challenge Magazine, Issue 69, February 1993.
- Associates & Acquaintances: At the bottom of each Social or Estate Government Title are a list of one to three Vital Powers associated with that title. Any Vital Power – except Census – that is not associated with a currently *undisrupted* Social or Estate Title *will cost one more Act* to activate. This direct association of Social and Estate Titles with Vital Powers serves as a defining focus for the Titles and positions overall. It should not be difficult for balanced positions to have Social and Estate Titles covering all or most of the Vital Powers.
- ✓ The additional cost of one Act significantly changes the sequence in which Power Activations are processed during the Regular Turn. See Clockwork Universe, 3 The Streams of Time, p. 90, *supra*. This is a tricky issue requiring consideration; a position’s processing sequence can be changed by Government Title disruption.
  - ✓ If one Act is added to Commerce Power activations, the special rule allowing Cargo Ships to Unload RPs before Construction Power Activations sharing a Scene is abrogated, see Material Handling, 1 Construction, p. 664, *supra*.

The association rule may be considered an *optional rule* if participants desire, but it should be decided *before* choosing Government Titles during set up. Instead, undisrupted Social and Estate Titles with duplicate Vital Power associations should be considered insurance in case of loss of legitimacy of one of the Titles.

---

*“From this point of view, the history of institutions is the most pathetic of all records. Man has conquered the wild beasts; he has conquered his fellow man; he has conquered nature, but, collectively, he has never succeeded in governing himself. A good government remains the greatest of human blessings, and no nation has ever enjoyed it. There is no ruler, says Plato, who would be **unjustly** condemned by his subjects.”*

– Dean William Ralph Inge, “Democracy and the Future,” Atlantic Monthly, Vol. 129, March 1922, p. 290 (emphasis in original) (free on Google Books)

---

**AI Nanny:** Although Plato was speaking about rulers, it surely must have occurred to him that he might just as well be speaking of parents – the rulers of our age of minority who first brought us into existence without our consent (anti-natalism existed in ancient times too): There are no parents who would be unjustly condemned by their children.

GGDM deals directly with the topic of interstellar governments, and indirectly with planetary governments. Earth has never had a planetary government, whether by conquest or any other means. It is possible that global technology and global problems will lead a drift toward an

eventual planetary government, but right now, it's hard to imagine how or by what process (short of heavy-handed external pressure) a planetary government could be achieved on Earth (e.g., Twilight Zone, "A Small Talent for War" (1986)). How much corruption, carelessness and incompetence do we witness on a daily basis in administration of businesses and tasks much less complex than a planetary, in-system or interstellar government would be? This, participants should keep in mind in imagining the complexity and logistics of an interstellar government.

Would Nick Bostrom's "Singleton" (2006) be better?

- ✓ "A singleton has both potential risks and potential benefits. Notably, a suitable singleton could solve world coordination problems that would not otherwise be solvable, opening up otherwise unavailable developmental trajectories for civilization. For example, Ben Goertzel, an AGI researcher, suggests humans may instead decide to create an 'AI Nanny' with 'mildly superhuman intelligence and surveillance powers,' to protect the human race from existential risks like nanotechnology and to delay the development of other (unfriendly) artificial intelligences until and unless the safety issues are solved. Furthermore, Bostrom suggests that a singleton could hold Darwinian evolutionary pressures in check, preventing agents interested only in reproduction from coming to dominate. Yet Bostrom also regards the possibility of a stable, repressive, totalitarian global regime as a serious existential risk." – from Wikipedia article, "Singleton," February 6, 2019.

Nick Bostrom seems to have appropriated a word – I know something about that! Merriam-Webster online dictionary at *singleton*: **1**: a card that is the only one of its suit originally dealt to a player. Merriam-Webster does not include Bostrom's use nor does it mention set theory:

- ✓ "In set theory, a singleton is a set with only one member, but as I introduced the notion, the term refers to a world order in which there is a single decision-making agency at the highest level. Among its powers would be (1) the ability to prevent any threats (internal or external) to its own existence and supremacy, and (2) the ability to exert effective control over major features of its domain (including taxation and territorial allocation). Many singletons could co-exist in the universe if they were dispersed at sufficient distances to be out of causal contact with one another. But a terrestrial world government would not count as a singleton if there were independent space colonies or alien civilizations within reach of Earth." – Nick Bostrom, "What is a Singleton," (2005) (available on his website).

'AI Nanny' is a theme that has appeared in many notable science-fiction works, for example, Kurt Vonnegut's The Player Piano (1952) where a large supercomputer functions exactly as described above (echoed in the backstories of other post-Singularity, post-apocalyptic works such as the board game Ogre (1977), the background stories of the movie franchises The Matrix (1999) and Terminator (1984)), and Isaac Asimov's Robot Eternals who decided that humans would only be happy in an all-human galaxy (The End of Eternity (1955), Foundation's Edge (1982)). It is no intellectual accident that opponents of the Patient Protection and Affordable Care Act (commonly known as "Obamacare") used the term 'nanny nation' to refer to 'big government' social safety nets.

- ✓ In a cute turn on the term, I heard 'singleton' used in a video to describe a single, usually orphaned kitten who may suffer from lack of socialization with other cats due to a lack of a mother and litter playmates, and may be a difficult pet if not socialized.

- ✓ **Rhetorical Question:** Would you be willing to be ruled by a ‘Deep Learning’ AI government, as in Buck Rogers in the 25<sup>th</sup> Century? Is that the solution? You saw this one coming! See The AI Problem excerpts, Corporations, *infra*.

*“Avoid overly pretentious job titles such as ‘Lord of the Realm, Defender of the Faith, Emperor of India’ or ‘Director of Corporate Planning.’”*

– Anonymous

**Forming a Government:** During the setup process, positions obtain their initial Government Titles, which must include one, and only one, Structural Title, and two to four other Social and Estate Titles. See The Power to Choose, 5 Beginnings, p. 50, *supra*. Thereafter, any *voluntary act* relating to restoring, abandoning, adding, or changing Government Titles, must be done by activation of the Order Power for the purpose of Government Formation. Any alteration in the government is a very serious matter that consumes the attention of society during the process, as groups struggle to achieve their agendas, place, or to gain power, therefore, activation of the Order Power for purposes of Government Formation requires two Acts and a Scene on the Capital Colony or three Acts *when and only if* the position currently does not have a Capital Colony.

- ✓ Positions should avoid Government Titles that conflict with **Fundamental Realities**.
- **Gone With The Wind:** The Concierge will not allow a position to exist for a long period of time without at least one undisrupted Government Title (unless the position is extinct and/or all players have dropped, or as part of the story arc, e.g., Somalia in the 1990s). A position which has no undisrupted Government Titles is a collapsing position, and a helpless position, e.g., a nation without a state, like Somalia in the 1990s, the Palestinians, or the modern Kurds, the largest nation in the world without a sovereign state. All three of these are ongoing ‘trouble-spots’ in our times. Somalia became the epitome of 1990s ‘failed state’ debates.

Each situation will be judged and acted upon independently by the Concierge, however, when a position has no undisrupted Government Titles, the Concierge *may do whatever is necessary* (not, ‘necessary and fair’) including taking Acts and Scenes from other places, shifting RPs, and blocking News Events, to restore the position to at least one undisrupted Government Title so that the position may activate a power to try to restore legitimacy and stabilize the situation. It is quite likely that such a situation will generate tremendous amounts of entropy in the game as well, and losses of resources, colonies, etc. Whenever this occurs, the situation will be posted by the Concierge as a Special Bulletin.

There are three options which could solve this ‘problem’ if participants prefer:

- ✓ The rule could be changed so that each position receives a number of Power Activations equal to the number of undisrupted Government Titles plus one, meaning that any position that has no undisrupted Government Titles will still have one Power Activation. This also means that with five undisrupted Government Titles, a position may (if it has sufficient Acts and Scenes) activate six Powers per Regular Turn.
- ✓ The second option includes the foregoing except that the number of Power Activations per turn is capped at five. In this case, a position is unaffected by the first disruption of a Government Title, making legitimacy less pressing. But the cap also preserves the scarcity restraints imposed by the normal Power Activation rules.

Neither option would grant more Acts and Scenes per Regular Turn as those are received based on undisrupted Government Titles, and thus a position may still have one Power Activation per turn but is receiving no Acts or Scenes. Likely such a position will still have some Acts and Scenes on the Power Strip.

As Power Activations, Acts and Scenes in GGDM represent the ‘scarcity of means’ (see Shoestring Production, 3 The Sidereal Stage, p. 122, *supra*, also Player Piano, 2 Eras, p. 770, *infra*), participants should be extremely careful and cognizant of any changes that increase the overall availability of any of those three in the game. It creates the same sort of problem as a Monty Haul role-playing campaign.

- ✓ Third, an Expose’ is also an attractive option to attempt to retrieve the situation *as no Power Activation is required* for an Expose’ (see In a Trice, 4 Writs, p. 448, *supra*). In game story terms, this may be most preferable and an Expose’ could be made a requirement whenever a position has no remaining undisrupted Government Titles.

Any of these options would alleviate the need for emergency Concierge action to artificially restore the position to minimum functionality. If any of these optional rules are preferred, they should be invoked before the beginning of the game.

- Alien Governments: A position’s Government Titles (and the Foresight) are secret, unknown to other positions, unless someone chooses to tell them. However, clever players may be able to see a silhouette profile of your position’s government (*Mens rea*) by observing acts (*Actus reus*) taken in the game – which, incidentally, describes the phenomenology of most relationships between humans, such that the exception is notable. Thus, a game of GGDM might be described as a bunch of people in the middle of an open field (i.e. the Galactic Space).

- ✓ This is why criminal law has found it necessary to develop the concepts of *Mens rea* (i.e. “the guilty mind”) and *Actus reus* (i.e. “the guilty act”) to establish criminal liability. However, these are *simply natural extensions* of what hunters and tribal warriors knew in prehistoric times – that the mind or intent of a creature can be determined *by observing acts and demeanor* (this may be the source of anthropomorphism, see also mythopoeic thinking, see discussion in 1 Temporal Technology, *infra*) – and people of classical antiquity applied these concepts to more complex relations with people. Strict liability laws are those that establish culpability on *Actus reus* alone.
- ✓ As James Baldwin might say, most people have guilty minds; “A reasonably sensible man is satisfied with thinking.” It is the guilty act + the guilty mind that is criminal. Thinking – whether in conformity or non-conformity – is not criminal.

---

*“Our democracy is but a name. We vote? What does that mean? It means that we choose between two bodies of real, though not avowed, autocrats. We choose between Tweedledum and Tweedledee.”*

– Helen Keller, quoted by Howard Zinn, [A People’s History of the United States](#), (2005), p. 345

---

**An Unlimited Term:** The term ‘government title’ has two meanings at any given moment. First, it is what the form of government is called, such as a republic, democracy, oligarchy, etc., and at the very same time, it is also the rights of ownership of power in that government, the rights (i.e. legitimacy, sovereignty) by which the governors claim to govern. Thus, the title is both the name and the right of the Government Title.

- ✓ **Rhetorical Questions:** What is the difference or relationship between rights and legitimacy; can the concepts be separated in any meaningful way? Do rights exist without legitimacy? Are legal ‘rights’ connected to morally *right*? Are freedom and sovereignty established (and synonymous) by rights or *vice versa*?
- **The Duality:** A Social or Estate Government Title within the game consists of two parts. Part of the Government Title is placed in the Public Space (i.e. occupies Monads), and will occupy a significant amount of the Public Space. The second part of the Government Title is called the Magna Carta,<sup>4</sup> which describes legitimacy requirements and Conflict Checks.

Dualism and duality have long been a part of at least Western civilization (cf. holism), possibly the center of it (e.g., the mind-body division of the Platonic philosophers that was ported to Christianity, or the pristine heavens vs. filthy, flawed Earth); consider the following:

- ✓ “In 1707 Pope Clement XI declared the Chinese rites idolatrous and ordered the Jesuits to repudiate them. [Manchu Emperor] Kangxi was infuriated that Europeans who could not even read Chinese characters were condemning practices the he himself considered to be civil, not religious, customs.... By now, however, the Chinese themselves were questioning the compatibility of Catholic orthodoxy with their traditions. They recalled that even some Jesuits had once depicted them as unimportant minor descendants of Old Testament Hebrews. Moreover, the dualism of Christian theology was unintelligible to them; the exclusiveness of Western religion was repugnant; its glorification of poverty presented a danger to society. Even China’s earlier receptivity to European technology and the fruits of inductive reasoning waned, and the country turned its back on Western-style modernization.” – Raymond Birn, Crisis, Absolutism, Revolution: Europe 1648 to 1789 (2<sup>nd</sup> Ed., 1992), p. 170.

Dominance of dualism in religion, politics, and all areas (and later, reductionism, positivism) of human cognition is the reason we now argue about holism as a view. Pristine heavens and the dirty Earth, inside my head, outside my head, mind vs. body, us and them. If *holism* dominated the worldview, would we be arguing now about a philosophy of dualism? Are both necessary?

*“No serious sociologist any longer believes that the voice of the people expresses any divine or specially wise and lofty idea. The voice of the people expresses the mind of the people, and that mind is made up for it by the group leaders in whom it believes and by those persons who understand the manipulation of public opinion. It is composed of inherited prejudices and symbols and clichés and verbal formulas supplied to them by the leaders.”*

– Edward Bernays, Propaganda (1928)<sup>5</sup>

Endnotes.

<sup>1</sup> **Commentary:** The Federalist Papers are all available for free online, e.g., The Avalon Project, Yale Law School.

<sup>2</sup> Citation: Star Trek fans may be reminded of the ST:OS “A Piece of the Action” episode (1968).

<sup>3</sup> Commentary & Citation: Stephen R. Donaldson explores one possible arrangement at in his Gap Cycle books:

- ✓ “All humans are citizens of one federal democracy, but that state has no military or police force equipped to operate in space. Instead, they delegated human interests in space to the UMCP. Although the United Mining Companies Police is a wholly owned subsidiary of a for-profit corporation, their charter grants them full police powers anywhere in open space. However, each space station has maintained its own security force with jurisdiction over the station itself. ... This seeming incompetence provoked widespread outrage and destroyed public confidence in local security. The legislature responds by passing the ‘Preempt Act,’ giving the UMCP the power to override station security essentially at will. The truth about the theft is that Warden Dios, the director of UMCP, and his boss Holt Fasner, CEO of the UMC, engineered the crisis in order to get the Preempt Act past the legislature. ... Rather than continue to allow Fasner to rule space through his private police, Warden wants the government to nationalize the UMCP, making them answerable to the state. Fasner’s political influence is so great that Warden doesn’t think the government can be persuaded by ordinary activism, and he fears that Fasner will have him killed if he supports a reform movement openly. Warden believes the only thing that could persuade the government to reform the police would be a scandal so devastating that it utterly discredits their moral authority and implicates the CEO, Fasner, and so Warden has decided to make that happen. His plan is to manipulate Fasner into using the police for a variety of heinous crimes – such as bribing station security, working with pirates, or murdering witnesses – and then deliberately fail the cover-up, without allowing Fasner to realize that he is trying to fail.” – from Wikipedia article, “The Gap Cycle,” (series of books by Stephen R. Donaldson).
- Basically, what happens when you send someone else to do your dirty work; the servant CEO Fasner was slowly making himself the master (i.e. *de jure* dictator) through control of the UMCP. As repugnant as this situation appears to us, it is, to Mr. Donaldson’s credit, not implausible:
  - First, it may have been the *de facto* situation already that a major corporation controlled all space traffic, domestic shipping, shipbuilding, technology, and trade and that corporation virtually ruled the Earth or exerted enough political pull to prevent Earth government from exercising sovereignty by forming interstellar police and military forces. Thus, it was easy for Earth government to simply charter the UMCP to do the job.
  - Second, the arrangement makes Earth and the colonies essentially a captive market of United Mining Corporation, a captive market – humanity – which it has a vested and existential interest in protecting. A civil war splitting sovereignty and creating competing military and police powers would be a disaster for that corporation.
  - And third, the human population does not pay taxes to support police and military forces (and what would democratic politicians campaign about if they couldn’t promise to lower taxes?), they do so instead by supporting UMC’s sovereign market monopoly. Recent history has shown the folly of the belief that by contracting out public services to private corporations, the public and politicians can get something for nothing; see the Carillion Collapse, Gross Domestic Product, 1 Construction, p. 662-663, *supra*. But this goes much, much further than that.
  - Finally, taking a page from history, by passing the Preempt Act, the Earth legislature, like the Reichstag’s passage of the Enabling Act in 1933, effectively voted itself impotent; and since it is past history, it is plausible future history in science-fiction literature.

✓ See also discussion of citizenship, Civis Sum, 3 Order, p. 559, *supra*.

<sup>4</sup> Commentary: The Magna Carta is an actual historical document dating from some centuries before the first UFO was shot down by United Earth Forces over Roswell, however, its literal meaning is “great charter” and it is in that sense that it is used here as part of a Government Title.

<sup>5</sup> Commentary: Consider the preceding in light of the 2016 U.S. Presidential Election, or, for that matter, every Presidential and major election in U.S. history. Words written in 1928 are revalidated by recent living memory. Three more U.S. Presidential Elections will occur to prove the point before these words are 100 years old.

*See Appendix GT – Emergent Government Titles*  
*See Appendix IP – Interventions Reference Sheet*

*“It does not matter whether the right to govern is hereditary or obtained with the consent of the governed. A State is absolute in the sense which I have in mind when it claims the right to a monopoly of all the force within the community, to make war, to make peace, to conscript life, to tax, to establish and dis-establish property, to define crime, to punish disobedience, to control education, to supervise the family, to regulate personal habits, and to censor opinions. The modern State claims all of these powers, and, in the matter of theory, there is no real difference in the size of the claim between communists, fascists, and democrats.” – Walter Lippmann, A Preface to Morals (1929)*

**Republics or Principalities:** Walter Lippmann’s idea of the state echoes both Max Weber’s classic definition of sovereignty and also Machiavelli’s famous introductory distinction of two types of sovereign states:

- ✓ “All states, all powers, that have held and hold rule over men have been and are either republics or principalities.” – opening lines to The Prince by Machiavelli (1513), translated by W.K. Marriott.
- ✓ Mr. Weber died in 1920, nine years before the Lippmann book, Mr. Bernays published Propaganda the year before.<sup>1</sup>

Note how Lippmann’s description parallels in many respects the Vital Powers described in GGDM – one of dozens of instances where the game design concepts (mainly from 2000-2002) preceded my discovery of intellectuals who already had pioneered the same concepts. This is not to say that I am any sort of intellectual prodigy – I am assuredly not – but that those concepts have become part of our milieu and in my youth, I picked up on the threads of the concepts without knowing or even asking, their origins. This process has been an intellectual version of Zeno’s Paradox, where I play Achilles, forever chasing the tortoise.

- ✓ I did read The Prince when I was about 20 years old. When I later read Albert Camus’ The Fall (1956) in World Literature in my senior year of college – I was 29 years old then – I felt it resembled somehow The Prince, though I still cannot say exactly why. It was just a connection I couldn’t shake. Just something about it...

*“Norway is a sovereign nation. Were we to accede to Germany’s demands, we would not be. The answer must therefore be no.”*

– Foreign Minister Koht, The King’s Choice (2016), from English subtitles

**The Earthly Entanglement:** Sovereignty is the necessary, exclusive property of an independent state or entity.<sup>2</sup> Max Weber famously defined a State as, any “...community that successfully claims the *monopoly of the legitimate use of physical force* within a given territory.”<sup>3</sup>

- ✓ Within the view of the Marxist-socialist, Max Weber’s formulation is but an expression of the capitalist-bourgeois ideology, to wit:
  - “In the works of the founders of the liberal tradition – that is, the founders of bourgeois ideology – liberty is security and security is liberty. For the

ruling class, security always has and always will triumph over liberty because ‘liberty’ has never been intended as a counter-weight to security. Liberty has always been security’s lawyer.” – George S. Rigakos and Mark Neocleous, “Anti-Security: A Declaration,” 2011, [https://www.academia.edu/2292255/Anti-security\\_A\\_Declaration](https://www.academia.edu/2292255/Anti-security_A_Declaration).

- ✓ See also, The Bargain discussion at the end of 5 Culture, p. 426, *supra*. ‘Supra-Legitimacy’ was also discussed in relation to Type 3 Fundamental Realities in 3 Beginnings, p. 42, *supra*, and in relation to the ‘Happiness Meta-Aspect’ in 4 Culture, pp. 409, 411, 414, *supra*.
- ✓ In this Marxist view then, security is not a ‘supra-legitimacy’ requirement of all governments, just those of the bourgeois ideology, and there only to the elite rulers, which view I believe would be rejected by the vast majority of humanity.

Sovereignty and legitimacy are the oldest known parts of the ‘structure’ of human civilizations and thus are properly included in any structural discussion.<sup>4</sup> However, sovereignty is not the application of force alone, it also requires a set of social, cultural, and economic forces that establish that force should not be needed but that if it is needed, it is legitimized.

- ✓ The *Ewiger Landfriede* passed in 1495 universally outlawed the medieval practices of feud and vendetta in the Holy Roman Empire. This created the state monopoly on the use of force in the modern sense, and required the creation of a judiciary to settle disputes, which removed dispute mediation from the direct power of the Emperor. It was the culmination of a medieval peace movement, and its eventual triumph over the next century shows that civilization found it preferable and internalized the idea.
  - A parody of this process must occur in any space-opera setting.
- ✓ The Peace of Westphalia in 1648, made religion a sovereign choice and established inviolate borders, ending the religious wars and establishing international relations.

The structure of a government or political union is determined by who holds sovereignty. Sovereignty in a unitary government system is held by a single person or very small group of elites who can impose their supreme authority on the rest of the population and delegate authority.<sup>5</sup>

Smaller political units hold sovereignty in a confederation and form an intergovernmental umbrella organization for mutual benefit without giving up their sovereignty. A federation is a compromise contractual or quasi-contractual/customary distribution of sovereignty. Civil wars, revolts, succession disputes and insurrections almost always involve a declaration of sovereignty by a group that is not considered to hold sovereignty. Conquest, Conversion and Naturalization of populations (and even reversion) all relate to progressive acceptance of alien or foreign sovereignty.

There is a judicial view that the American Colonies, individually, never at any point had sovereignty, and thus could not have given, granted, conferred sovereignty to or upon anyone, but that sovereignty was conferred upon the colonies collectively by the King of England at the Treaty of Paris (certainly, the Founding Fathers agreed with Judge Bradshaw, see Luther & Charles excerpt *supra*). This view runs counter to the commonly held notion that states gave sovereignty to the federal government in forming the Articles of Confederation, and to the authority under which the state and local police forces have jurisdiction – how can state and local police have jurisdiction if they are not somehow sovereign?

Changes in sovereignty are momentous and, usually not peaceful, events within a society or civilization. There is always some group who has a vested interest in the *status quo* and/or who will perceive a threat arising from any change in sovereignty. Sovereignty is not an abstract concept; it is very real and enforceable by the necessary monopoly on the legitimate use of violence. It is also zero-sum.

- ✓ It is an interesting question for debate, whether each person is sovereign – that is, born sovereign or sovereign at adulthood – and gives up sovereignty by being part of society/civilization, or whether individuals are not sovereign, but that sovereignty is created when a government is formed that claims a geographical territory and certain powers.<sup>6</sup> Is each animal sovereign? Do our criminal laws treat individual's bodies as sovereign and inviolate? Which side you choose to argue speaks volumes about your philosophical leanings, are you a naturalist, transcendentalist, formalist or legalist?<sup>7</sup>
- Dirty Hands: Monopoly on the legitimate use of physical violence implies death or injury, it implies the willingness to inflict death or injury to keep 'order' and enforce laws. We all like to think we agreed to this by supporting law and order, but really, on a daily basis, our support is irrelevant in that respect; the monopoly was inherited by the current government.
  - ✓ “Civilian authorities left all prerogatives to General Jacques Massu who, operating outside legal frameworks between January and September 1957, successfully eliminated the FLN from Algiers. The use of torture, forced disappearances and illegal executions by the French later caused controversy in France.... On 23 March following a meeting between Massu, Trinquier, Fossy-Francois and Aussaresses to discuss what was to be done with Ali Boumendjel, Aussaresses went to the prison where Boumendjel was being held and ordered that he be transferred to another building, in the process he was thrown from a 6<sup>th</sup> floor skybridge to his death.

Major Aussaresses was unapologetic regarding the actions he had undertaken during the battle, he said that ‘The justice system would have been paralyzed had it not been for our initiative. Many terrorists would have been freed and given the opportunity of launching other attacks .. The judicial system was not suited for such drastic conditions... Summary executions were therefore an inseparable part of the tasks associated with keeping law and order.’... The battle was the first clearly definable French victory of the war. The Paras and their commanders enjoyed immense popularity with the Pied-noirs and this sense of exuberance and strength would reach its zenith during the May 1958 crisis. ... As details of the use of torture and summary executions became public in the years following the battle and the end of the Algerian War, the French victory and the reputations of many of the commanders became tainted by the methods used in the battle.” – from Wikipedia article, “Battle of Algiers.”<sup>8</sup>

When the revolutionary characters in the movie *Snowpiercer* (2016) discovered that the guards had no bullets, the ultimate Why Not – the threat of instant death or punishment – vaporized in a second. The revolution was on!

- ✓ Irrelevance of consent to monopoly on the legitimate use of force on a daily basis is not the same as arguments about *police effectiveness* on a daily basis. Consent or cooperation of the population has a major impact on policing effectiveness daily (some neighborhoods are known to be or deemed hostile to the police); that is an argument related more to GGDM Enlightenment and Constructural Elements concepts.

- ✓ The core concept of non-violent resistance, non-violent protests is to deprive the authorities of any reason, any opportunity, to legitimize the use of force or violence against the dissidents to disperse the opposition. The second is to be willing to take the risk that they will anyway, the willingness to be victims of the government. Like the Soviets during the Berlin Airlift, if done correctly, with discipline, force of will, and intellect, the government is put into a difficult situation, and the bigger the protest, the better.

The development of the concept of sovereignty is inseparable from and intricately entangled with tribal warriors and heroic stories – the latter morphing into religion and tradition among warriors.<sup>9</sup> Who else was available to apply physical violence? And to rule and protect, they needed a monopoly on it and a leader to direct them. If for some reason you think this is not conceptually accurate, then we need a new definition of sovereignty. How would the concept of sovereignty develop among other races, for example, sheep or frogs or Emperor penguins? Thus global pacifist movements envision a world without borders – i.e. without sovereignty, and the more anarchist sorts also believe in limited or no government and/or police.

- ✓ “The script, titled *Dead Right*, by the husband-and-wife team of Harry Julian Fink and Rita M. Fink, was originally about a hard-edged New York City police inspector, Harry Callahan, who is determined to stop Travis, a serial killer, even if he has to skirt the law and accepted standards of policing, blurring the distinction between criminal and cop, to address the question as to how far a free, democratic society can go to protect itself.” – from Wikipedia article, “*Dirty Harry*,” September 29, 2019.
  - ✓ “Nothing wrong with shooting as long as the right people get shot.” – *Dirty Harry*, *Magnum Force* (1973).
  - ✓ “Gary Crowds wrote in *Cinéaste*, ‘We are left with the comforting assurance that when we need him, Harry (and all the cops like him who do the ‘dirty’ jobs no one else wants) will be there protecting us from the lunatic fringes of both Left and Right. Sure, Harry may be a little trigger-happy but at least he shoots the right people. The problem, however – one which the film raises but never resolves – is who determines the definition of ‘right’ people?’” – from Wikipedia article, “*Magnum Force*,” September 29, 2019.
    - One critic noted that it would require an hour to explain, for each movie, why *Dirty Harry* is not in prison.
- Glove Cleaner: Power and responsibility go hand in hand, when one exists without the other, chaos or tyranny ensues. In each of us, our megalomaniac and narcissistic inner-selves can imagine power without responsibility; many historical situations feature sovereign power over but without responsibility to select groups or input from those groups resulting in exploitation, discrimination, resistance, and revolts (e.g., the War of the Sicilian Vespers).<sup>10</sup>
- ✓ “Freedom, however, is not the last word. Freedom is only part of the story and half of the truth. Freedom is but the negative aspect of the whole phenomenon whose positive aspect is responsibility. In fact, freedom is in danger of degenerating into mere arbitrariness unless it is lived in terms of responsibility. That is why I recommend that the Statue of Liberty on the East Coast be supplemented by a Statue of Responsibility on the West Coast.” – Viktor Frankl.

- There is, in fact, a Statue of Responsibility Foundation for that exact purpose, see <https://www.statueofresponsibility.com/>. It's been around awhile, it doesn't seem to be very close to reality.

Power without responsibility is one of the great injustices that our political and judicial systems have sought to address, in a sense, for example, it might be a cause of the American and French Revolutions, Great Depression or the World Wars, and certainly of the dynastic wars that preceded them. And in our jobs and our lives, we have all experienced being held responsible for events and people we have no power over.

- ✓ Even Yahweh (aka Jehovah) in Robert Heinlein's *Job: The Comedy of Justice* (1984) was held to responsibilities by a higher power: The Branch Office. And Mr. Koshchei (probably related to Ambassador Kosh in *Babylon 5*, both from the Russian fables) had responsibilities to higher-ups, going back in infinite regression. Mr. Koshchei fined Yahweh for abuse of volitionals by forcing him to regenerate the Earth before the Rapture at his own expense from backup files.
- **Might Makes Right:** Implicit in the concept of sovereignty is the idea that might makes right. There is no avoiding it when resistance is removed and disputes are settled by legitimized physical force or resolved by the threat of it. In pre-Socratic societies, the concept had already become entangled with divine sanction, destiny, and heroic tales.
- ✓ “Rather than upholding a *status quo* and accepting the development of what he perceived as immorality within his region, Socrates questioned the collective notion of ‘might makes right’ that he felt was common in Greece during this period.” – from Wikipedia article, “Socrates.”

Thus Socrates was challenging both the concept of dynastic and aristocratic sovereignty preeminent in his day, but also the mythic religion that supported it. Thus, he was charged with religious impiety and corrupting the youth (see *Hand Me the Hemlock*, 1 Disruption, p. 256, *supra*).

And when hegemony is established by physical force or the threat of it, as is usually the case in history – there are millions of examples – the same problem occurs: Implicitly ‘might makes right.’ This then dovetails into the Hegemony discussion in 4 Order, p. 570, *supra*.

---

*“There’s a reason you separate military and the police. One fights the enemies of the state. The other serves and protects the people. When the military becomes both, then the enemies of the state tend to become the people.’ That quote comes from *Battlestar Galactica*’s Commander Adama. He says it in the second episode of the first season of the series, ‘Water,’ written by Ron Moore. That episode is 10 years old. It’s kinda crazy that a science-fiction story about interstellar warfare can so eloquently describe the horrifying situation in St. Louis County, Missouri. But it does. And so say we all...”*

– Alex Abad-Santos, “*Battlestar Galactica*’s timely warning about the militarization of policing,” *Vox* (vox.com), August 14, 2014

---

**The Roslin Maneuver:** The issue of the ‘militarization of the police’ came to a boil in the summer heat of August 2014 in Ferguson, Missouri. Generally the discussion involved three points: a siege mentality among the police (aggravated by racism), the heavy-handed militant response by the police to protests and rioting, and the questionable decision of the U.S. Government to provide police with discarded military equipment to enhance their ability to fight foreign terrorism and drug gangs (related to the problem created by the Prohibition, see *Flying the Banner*, 4 Government Titles, p. 632, *infra*; see also the Opium Wars, 3 Commerce, p. 1216, *infra*).

- ✓ “On August 14, United States Senator Claire McCaskill (D-MO) stated that ‘militarization of the police escalated the protesters’ response.’ St. Louis Chief of Police Sam Dotson stated he would not have employed military-style policing such as that which transpired. According to Chief Dotson, ‘My gut told me what I was seeing were not tactics that I would use in the city and I would never put officers in situations that I would not do myself.’ Another reason Dotson did not want the city and county police to collaborate was because of the history of racial profiling by police in that county.” – from Wikipedia article, “Ferguson unrest,” captured August 9, 2019 (five years later).

The civil state of any modern country can be judged by the relationship between the military, the police and the population; 2014 provided an unwholesome image of U.S. police departments as a hostile occupation force.<sup>11</sup>

Sometimes the media can be the police; *All the President’s Men* (1976) was a ‘procedural police crime drama’ with newspaper reporters instead of police because law enforcement authorities were politically conflicted, inept, and untrustworthy in a situation involving the President of the United States.

- ✓ See previous parallel discussion regarding separation of political and military leadership, sociopolitical boundaries, *The Fog of Lützen*, 4 Colleges, p. 510, *supra*.

One of the most effective comments I saw was a post by an Iraqi War (and occupation) veteran which included a picture of him on patrol in Baghdad, with just a rifle and a combat vest and helmet. He commented that he ‘patrolled one of the most dangerous cities in the world with less equipment and heavy-handed force’ than the Ferguson, Missouri police used in responding to an initially peaceful protest.

---

*“There is a contract and a bargain made between the King and his people, and your oath is taken: and certainly, Sir, the bond is reciprocal; for as you are the liege lord, so they liege subjects ... This we know, the one tie, the one bond, is the bond of protection that is due from the sovereign; the other is the bond of subjection that is due from the subject. Sir, if this bond be once broken, farewell sovereignty! ... These things may not be denied, Sir ... Whether you have been, as by your office you ought to be, a protector of England, or the destroyer of England, let all England judge, or all the world, that hath look’d upon it” – Judge Bradshaw’s response to Charles I at Trial in January 1649*

---

**Regals and Revolutionaries:** In the end, King Charles I lost his stutter and seemed to have understood very clearly the issues. The question he asked was fatal to the future of European monarchies (and of clerical-based legitimacy) and Louis XVI in 1793. Unfortunately, he was so convinced of his hereditary divine right to rule that he could envision no other basis for legitimacy. Judge Bradshaw knew already what position Charles I would take before the High Court convened by the Rump Parliament, and was waiting for the opportunity to *assert supra-legitimacy* as a principle over the King's claim of personal and exclusive sovereignty.

- ✓ See Luther & Charles excerpt, this section.

Giuseppe Garibaldi, the globe-trotting Freemason revolutionary hero of the Italian Unification (and also in South America) was in his youth a revolutionary seeking liberation and unification of Italy, as well as republicanism, social reform, and abolition of the Papacy and all clerical temporal power in Italy. After conquering Sicily and marching to capture Naples in 1860 (at age 53), he seems to have abandoned his campaign for social reform and republicanism – he sided against a peasant revolt in Sicily – instead fighting mainly for the unification of Italy, expulsion of foreign powers, and the recapture of Rome from the French (and abolition of the Papacy). This was a recognition that the forces in play (e.g., Emmanuel II), and his best possible chances for unification of Italy, were not either republican or interested in social reform. Thus, establishing sovereignty and restoring the ancient capital of Italy (and generating international sympathy) was the first priority (and this extended to the liberation of the Balkans, Greece, and Hungary) and the key to long-term self-determination of peoples. Garibaldi likely thought that social reform and republicanism would develop later if the people wanted it.

Subsequent history seems to confirm the validity of this idea; it took nearly a century and a national catastrophe for democratic forces to assert themselves in modern Italy. On July 25, 1943, King Victor Emmanuel III of Italy was able to finally reassert royal constitutional authority, dismiss Benito Mussolini from the government and have him arrested a few days after Rome was bombed by the Allies for the first time. The subsequent Armistice by Italy with the Allies and dissolution of the Fascist Party triggered the German occupation of Italy on September 8, 1943. Italy became a republic by referendum on June 2, 1946, and the King, Umberto II, was forced to abdicate and go into exile. Italy had grown tired of being Europe's centuries-long dynastic game of kick the can, tag, and king of the hill for every would-be conqueror.

- ✓ “I have seen three emperors in their nakedness, and the sight was not inspiring” – Otto von Bismarck (unsourced).
- Wake, Waking: Although the terms “imperial” and “empire” may be distasteful to modern Western citizens of democratic countries, empires are necessary for the development of the structures of human civilization by consolidating and centralizing economies, order, governance, political and military power and forcing the exchange of cultures – they were part of a historical process. In the chaos that follows the fall of the empire; the memory remains.
  - ✓ “‘Genesis, growth, time of troubles, universal state, and disintegration.’ British historian Arnold J. Toynbee published a twelve volume work in 1961 called A Study of History. Those five words are what he deemed to be the stages that all civilizations go through before they ultimately break down. Toynbee argued that civilizations are not brought down by loss of control over the environment or loss of control over the human environment. He also added that attacks from the outside were not necessarily responsible for a society's collapse. But rather it was the societies themselves that

- fail to solve new problems. Instead of creating new solutions to new problems, they overdevelop the structures for solving old ones.” – J.A. Willoughby, “The Promised Land,” This Side of Center (2014), p. 150 (Joseph Tainter seems to agree...).
- ✓ “The old civilisation, with all the brilliant qualities which make many moderns regret its destruction, rested on too narrow a base. The woman and the slave were left out, the woman especially by the Greeks, and the slave by the Romans.” – Dean William Ralph Inge, “St. Paul,” The Quarterly Review, Vol. 220, Nos. 438 & 439, January & April, 1914 (p. 61).<sup>12</sup>
  - ✓ “Quite often the fall of such early empires acquires for later peoples the status of a paradise lost, a golden age of good government, wise rule, harmony, and peace, when all was right with the world. This is clearly evident in the writings of, for example, Gibbon (1776-88) on the Antonine period of the Roman Empire, of the ‘Hundred Schools’ on Chou China (Creel 1970; Needham 1965; Fairbank et al. 1973), or of Nehru on Mauryan India (1959). The attempt to understand the loss of paradise is at the same time a grasping to comprehend current conditions and a philosophy of how a political society should be. Here then is another dimension to the study of collapse: it is not only a scholarly attempt to understand the past and a practical attempt to ascertain the future, but also, in many minds, a statement of current political philosophy (see, for example, Isaac [1971]). This last aspect will not figure highly in the present work, but does account for much of the perennial concern with collapse.” – Joseph Tainter, The Collapse of Complex Societies (1988), p. 39.

St. Augustine of Hippo in On Christian Doctrine (426 A.D.) argued against the complete rejection and abandonment of the cultural achievements of classic antiquity during the terminal decline of the Western Roman Empire (arguing against, for example, his contemporary, St. Cyril of Alexandria whose monks murdered and dismembered Hypatia), but rather that ‘pagan’ skills and knowledge, be incorporated into the new age and repurposed for a Christian world. In his youth, St. Augustine was a teacher of rhetoric in Carthage and was appointed Rhetorical Professor in Milan where he became friends with Ambrose of Milan, also a great orator and rhetorician, thus, St. Augustine saw value for Christianity in pagan arts and knowledge, of which rhetoric was key to spreading the new gospel.

---

*“I can picture in my mind a world without war, a world without hate. And I can picture us attacking that world, because they’d never expect it.”*

– Jack Handey, “Deep Thoughts” (Saturday Night Live)

---

**Earth Landing:** Most of the classic aliens-land-on-Earth stories involve a violation of some nation’s sovereignty, including – for those who believe – landings by UFOs that have been reported over the years, or even UFOs flying through our airspaces. If aliens, however, landed in the ocean (e.g., The Outer Limits, “Trial by Fire” (1996)), that would be a different issue as no nation can claim sovereignty over the oceans (per classic international law) – do the nations of the Earth as a group have sovereignty over the oceans and would an ocean landing be a violation of collective Earth sovereignty? That is problematical.

Of course, in the classic alien invasion movie, sovereignty is clearly violated, ignored, and is thus not addressed directly in the film. There are a couple of classic First Contact movies that

approach the sovereignty issue – either intentionally or unintentionally – in interesting ways. In *Close Encounters*, it is clear that the U.S. Government invited the alien mothership to land, so no violation of sovereignty occurred; whereas, in the 2016 movie *Arrival*, the heptapods clearly violated the sovereignty of many nations, and the Chinese – probably remembering two centuries of violation of their sovereignty and exploitation by Western powers – were about to initiate hostilities to destroy or eject the alien ship from their territory. Efforts to prevent this action provided the dramatic crucible of the film.

An alien invasion, in the mode of the classic Hollywood movies, would actually demonstrate that humanity is not so bad – because see, the rest of the universe is just like us! That would be the true danger. That is also probably the real reason why we like those kinds of movies. Note for example, that ancient gods of polytheistic religions were – just like us! They stole, they lied and deceived, they were vainglorious, they fought over territories, they were militaristic, jealous, they had craft and technology, they were masters of their realms, they even had children and died. In this sense, alien Earth invasion movies have simply replaced ancient gods.

---

*“The anti-slavery party contends that slavery is wrong in itself, and the Government is a consolidated national democracy. We of the South contend that slavery is right, and that this is a confederate Republic of sovereign States.”*

– Laurence Keitt, from Wikipedia article, citing to “Keitt, Lawrence [sic] M. (January 25, 1860). Congressman from South Carolina, in a speech to the House”<sup>13</sup>

---

**Crazy Men with Guns:** Though Mr. Laurence Keitt is certainly one of the more ... um ... colorful Congressional characters from that period (see 2 Order, EN 2, p. 544, *supra*), he did summarize the pre-Civil War *structural government dispute* perfectly. The Civil War Amendments (1865-1870, the 13<sup>th</sup>, 14<sup>th</sup>, and 15<sup>th</sup> Amendments to the Constitution of the United States) imposed the anti-slavery party’s vision of the structural relationship of the Federal Government and the States.

An argument has been made by historians that the raid on Harper’s Ferry in October 1859 was an important psychological turning point for the South leading to succession and the American Civil War. Prior to Harper’s Ferry, the South believed and assumed that no white man would ever risk his life or be willing to die for abolition of slavery; ironically, the first person killed by John Brown’s party was a free black man, Heyward Shepard, a baggage handler at Harper station who was shot in the back (looping back to the states had sovereignty argument, *ut supra*, p. 587).

Even though John Brown, who had military experience and a reputation from the 1856 Bleeding Kansas fights against the pro-slavery Missouri Border Ruffians, *was certifiably delusional* – he thought that seizing the armory would create a spontaneous slave revolt and he would gather an army at the arsenal and sweep through Tennessee to Mississippi freeing slaves<sup>14</sup> – *his fanaticism shocked the South* into realizing that militant abolitionist agitators in the North might eventually carry the general population to armed conflict.

The Estate of Southern Slavery was very alarmed by the size and organization of the Harper Ferry raiders, the number of people who knew beforehand (including two U.S. Senators), and by John Brown’s martyrdom in the Northern press. Every school child learns (and forgets as soon as the test is done) the historical coincidence: That future Confederate Army of Virginia commander Col. Robert E. Lee was in charge of retaking the arsenal from Brown’s hooligans, and

that his father was Col. “Light Horse” Harry Lee, who was relieved of command by General George Washington. The history of Arlington National Cemetery is bound up between the descendants of Martha Washington, Robert E. Lee, the American Civil War, and an 1883 Supreme Court decision.

- ✓ Delusional agitators are good excuses for Concierge Interventions in GGDM, *Interventions do not need to make strictly logical sense*. With technology, it takes only one crazy with a gun; imagine the effect of exponential technology and agitators?

**Structural Government Titles:** There are three types of Government Titles in GGDM. Structural Government Titles (hereafter, “Structural Titles”) reflect *the direction in which the power flows* in a governing system.

Among social creatures, there appear to be only three possible types of structures: Unitary, Confederation, and Dualistic. All positions must have at all times one Structural Title; no position may have at any time more than one *undisrupted* Structural Title.

- ✓ The distinctions really come down to a concept of sovereignty. Sovereignty in turn is a concept of kings. At some point in our early history, a chieftain said, this is my place, these are my people, I rule here, and thus was born the concept of sovereignty. That is, the sovereignty of the people was either vested in, or flowed from (can both be true?) their chiefs whose authority soon became hereditary property, flowing from generation to generation.
- **All Roads Lead To...:** Unlike Estate and Social Titles, Structural Titles do not occupy a separate, ‘exclusive’ area of the Public Space, but rather, dictate the arrangement of other Titles, Pathways connecting the Government to the Colonies, and the placement of the Capital Colony within the Public Space. Whenever the conditions required for the Structural Government Title cannot be met, it is *automatically disrupted* (a very rare occurrence):
  - ✓ A **Unitary Structural Title** requires that all undisrupted Social and Estate Titles be placed together in a bloc, all adjacent to each other, in the approximate center of the Public Space. Each Friendly, Naturalized, or Converted Colony owned by the position must be connected to at least one Social or Estate Title in the bloc by a Pathway of Monads *equal to or less than the total number of Social & Estate Titles plus one* at the time the Pathway is formed. One additional Monad may be added to the length of the Pathway if the Pathway joins another Pathway going to the bloc, but the total length of each Colony’s Pathway must individually comply. The Capital Colony must be connected by Pathways to three Social and/or Estate Titles, using the same rules as other colonies. If a new Capital Colony is declared, new Pathways must be created. The Public Space occupied by the Unitary Structural Title is congruent with the space required by the Estate and Social Titles and Pathways.
    - The Unitary Structural Title generally represents the classic ‘top down’ form of legitimacy (*dominus, basileus, homo summae potestatis*), what Justice Jackson called ‘negative legitimacy’ (e.g., monarchy, dynastic hegemony, divine right).<sup>15</sup> See Romantic Nationalism discussion, 3 Government Titles, p. 618, *infra*. The other Structural Titles are, in varying degrees, rejections of this ideology of force, recognizing *princeps* only

where necessary for military command, preservation of order, and law enforcement. *Führerprinzip* is synonymous with Nazi fascist dictatorship.

- ✓ A Confederation Structural Title requires that no two undisrupted Social and/or Estate Titles can be placed adjacent to each other in the Public Space. Each Friendly, Naturalized, or Converted Colony owned by the position must be connected by Pathway to both: 1) one of the Social or Estate Titles and 2) one other Friendly, Converted or Naturalized Colony controlled by the position. The combined length of the Pathways connecting any colony to both a Social or Estate Title and one other colony *must be equal to or less than* (in Monads) the number of undisrupted Social and Estate Titles plus the number of colonies at the moment the Pathway is formed. The Capital Colony must be connected by Pathways to all of the Social and Estate Titles using the same rules as regular Colonies, plus it must be connected to one other Friendly, Converted or Naturalized Colony controlled by the position. As such, the Confederation Structure may feature long and tenuous pathways that resemble a crazy 🌀🌀 or perhaps the runaround of our daily travels and relationships.

Page | 596

Confederations in GGDM’s interstellar setting represent a sort of bottom-up form of legitimacy (perhaps what Justice Jackson called positive legitimacy, though this is not certain) in terms of planetary governments and a central interstellar authority (without comment on the local planetary power arrangements or government structures).

- “In addition of being a military alliance, the Lombard League was one of the first examples of confederal system in the world of communes. Indeed, the League had a distinct council of its members, called *Universitas*, consisting of representatives appointed by individual municipalities, and which voted by majority in various fields (such as the admission of new members, war and peace with the Emperor), powers that grew more and more with the years, so that the *university* obtained regulatory, tax and judicial power, a system comparable to that of a present-day republic. In the first period of the League the communes had little to do with confederal affairs, and the members of the *Universitas* were independent; in the second period the municipalities gained some influence but, as a counterweight, members were more involved in the municipal council policy. In addition, the League abolished the duties, with the creation of a customs union.” – from Wikipedia article, “Lombard League,” December 11, 2018.<sup>16</sup>

Confederations may not be favored by modern people playing this game, but the Confederation is the most probable *voluntary* collective arrangement in an interstellar civilization and if treated in slightly non-standard ways, presents some of the most interesting science-fiction possibilities, for example, Cordwainer Smith’s Instrumentality of Mankind setting (1979).<sup>17</sup>

- ✓ A Dualistic Structural Title requires the position’s Titles to be arranged in two approximately equal blocs (in the manner of the Unitary Structural Title) that are not adjacent. Each Friendly, Naturalized, or Converted Colony owned by the position must be connected to both blocs, each by a Pathway *equal to or less than* the number of

Social and Estate Titles *plus two*, at the time the Pathways are formed. Thus the Dualistic Structural Title position will resemble the hemispheres and corpus callosum of the human brain. The Capital Colony must be nearer to one bloc than the other, but connected to both blocs following the same rules as other colonies. If the Capital Colony is relocated for any reason, the relocation must represent, in the Public Space, a power shift from one bloc to another. Thus, if the Capital Colony was previously nearer to one bloc of Titles, it must then be placed nearer to the other when moved. The space taken up by the Dualistic Structural Title is congruent with the space taken by the blocs and all of the Pathways.

The Dualistic Structural Title in GGDM represents more or less the modern Western notion of the nation-state and probably aligns most with Romantic Nationalism discussed in 3 Government Titles, p. 618, *infra*.

The worldwide trend over the last several centuries has been that the ‘cure’ for most security, social and economic ills has been increased power to national governments. In the United States, the very move from Confederation to Federalism was prompted, in part, by Shay’s rebellion and the external threat of foreign invasion. This trend, in combination with the advent of technology has seen more and more power going to the central constitutional government, making many citizens nervous. The problem is that all of the alternative cures suggested have not worked well. Thus, we are currently in the ‘down’ side of a historical cycle.

---

*“When in the Course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature’s God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.” – U.S. Declaration of Independence (1776)*

---

**The Claaw is Our Master:** The Pathways connecting colonies to Government Titles are inviolate, unmovable, and unavoidable; each colony (other than Conquered Colonies) on the Public Space *must be* connected to Government Titles pursuant to the type of Structural Title the position has chosen. Monads occupied by non-Structural Government Titles (*ut infra*) are inviolate, that is, they cannot be occupied by anything else or used for any other purpose, including connection of Research Groups or Fuzzy Groups. Inviolate means that Monads occupied by the Pathways cannot be used for anything else while the Pathway exists; however, other Pathways can cross a Pathway and Fuzzy Groups can be formed over and are unaffected by Pathways.

The Pathway should be as short and direct as possible and cannot be altered once established, notwithstanding any other items on the Public Space that may be in the Pathway when first laid – they must either be moved or removed at the discretion of the Concierge so that the Pathway can be created.

- ✓ The Pathway from each colony to a Government Title will use at least one of the adjacent Monads, leaving less adjacent spaces for Aspects and Research Pieces and anything else that must be placed adjacent to the colony on the Public Space. A combined Pathway running through a colony will use two adjacent spaces to enter and exit the Monad where the colony is placed, and thus might be disadvantageous.

- **Broken Escalator:** Pathways run between colonies and Government Titles generally, Pathways cannot and should not be connected to stars on the Public Space, connecting a Pathway to a star on the Public Space does not automatically connect all colonies located at that starsystem. For the purpose of Pathways, stars just occupy a Monad on the Public Space and can be moved as long as there is another legal place adjacent to the starsystem's planets on the Public Space.
- **Commons Footbridge:** Two or more colonies can join in a common Pathway as long as the Pathway does not run through a Monad occupied by a Colony. Careful placement of Fuzzy Groups, Government Titles and Pathways on the Public Space is an important aspect of play. Typically, colonies will group around the Government Titles, and the larger a position grows (in number of colonies) the more space will be taken by the Pathways. The economy of Pathways also favors larger colonies, because the same Pathway is required regardless of the size of the colony.
- **Roads Must Roll:** Positions may always choose to connect colonies to Government Titles by more Pathways than are required. This may be insurance against removal or abandonment of the Government Title, but it also consumes more Monads on the Public Space. Extra connectivity *could be interpreted* as extreme loyalty of the colony population.
- **Capitol Chaos:** At any time that the Capital Colony is moved and/or a new Capital Colony is declared, the target colony may need to be moved on the Public Space to a suitable, legal location and/or new Pathways be created to satisfy the requirements of the Structural Title. The Pathways take precedence; some things may be lost. Foresight and planning are key.

---

*“The term ‘citizen’ supplanted ‘subject’ in this country and others, although not in Great Britain, by a process of lexicographic delineation. Even in the period immediately before the American Revolution, there was no such difference in connotation between ‘subject’ and ‘citizen’ as would predicate reserving the status of ‘citizen’ to the people of a republic and ‘subject’ to those under the sovereignty of a monarch. Distinguished French lawyers, writing during the **ancien regime**, seem to have found nothing preposterous in their occasional use of the term ‘citizen’ with regard to the most absolutistically ruled subjects of the King of France. During the middle ages, ‘citizens’ lived in towns, and so were members of communities exempted from the then almost ubiquitous feudal system. But, when the medieval system of government was replaced by the principles of territorial state sovereignty, ‘subject’ and ‘citizen’ came to be used as synonyms, at least by such eminent writers as Bodin and Grotius, although others, including Pufendorf and Spinoza, obviously inspired by a passage in Aristotle’s **Politics**, attempted to re-establish a distinction between those two terms.*

*Spinoza’s abstractions remained without direct practical effect, until a passage in Rousseau’s **Social Contract**, adapting and somewhat coloring, but not quoting, Spinoza’s proposition, provided the stimulus which made ‘citizens’ the terminology for a self-governing people. An English version of the passage reads, ‘With regard to the associates, they take collectively the name of **People**, and are individually called Citizens, as participating in the sovereign power, and **Subjects**, as subjected to the laws of the state.’”*

– Maximilian Koessler, “‘Subject,’ ‘Citizen,’ ‘National,’ and ‘Permanent Allegiance,’” *Yale Law Review*, Vol. 56, Iss. 1, Art. 12, 1946 (emphasis in original)

---

**Subjects and Citizens:** A BBC article put forth the British view that the President of the United States is effectively an elected monarch; that the Founding Fathers had only monarchy to use as example and the presidency was created in that image.

The presidency of the United States combines what is often the president and prime minister in other countries, more or less. At the same time, U.S. Presidential elections, especially in recent years, have exposed the two greatest weaknesses of our democracy: That the process of candidate selection does not reliably produce the best quality candidates for President, and that our system of taxpayer-funded public education does not produce the best electorate either.

The true freedom of the United States was the singular opportunity to cast off the creaking order of the old world (British officers referred to English colonist as ‘Gillies’ – a Scottish term for a servant) to experiment with ideas that others had only dreamt of, such as Judge Montesquieu’s separation of powers and the ideas of Rousseau, Locke, and Hobbes regarding natural and inalienable rights and the duty of government; to rewrite the book. Few people who understand the concept of sovereignty would say that the sovereignty of the United States is in the person of the President (unlike a monarch who has *subjects*). As history has unfolded, the American break from the old order preceded the collapse of the European monarchies (and personal sovereignty of the head of state) and colonial systems into the 20<sup>th</sup> Century: Subjects became citizens.

- ✓ For example, look at the citizenship listings for Albert Einstein in the Wikipedia biographical article: He was a ‘subject’ of Kingdom of Württemberg (1879-1896), Austro-Hungarian Empire (1911-1912), Kingdom of Prussia (1914-1918) and a ‘citizen’ of Switzerland (1901-1955), Free State of Prussia (1918-1933) and of the United States (1940-1955).
- ✓ See also, Civis Sum discussion, 3 Order, p. 559, *supra*.

---

*“The political organization of space is a particularly powerful source of spatial injustice, with examples ranging from the gerrymandering of electoral districts, the redlining of urban investments, and the effects of exclusionary zoning to territorial apartheid, institutionalized residential segregation, the imprint of colonial and/or military geographies of social control, and the creation of other core-periphery spatial structures of privilege from the local to the global scales.”*

– Edward Soja, “The City and Spatial Justice,” JSSJ, January 2009

---

**Social and Estate Government Titles:** After the Structural Title requirement is met, each position may have as many Social and/or Estate Government Titles (chosen from the Foresight, see The Power to Choose, 5 Beginnings, p. 50, *supra*) in any combination, as desired up to the limit of five Government Titles, *including* the Structural Title.

The primary purpose of Structural Government Titles ... is to provide the ‘structure’ for a position and are also the most difficult to change or disrupt, they are the bastion of government. The Government Titles which have the most regular and direct effect on the position are the Social and Estate Government Titles.

- ✓ “Activists say these partisan maneuvers undermine democracy and *that politicians shouldn’t be choosing their voters*; politicians who gerrymander like to say that by

winning elections, they've earned the right to draw the districts as they see fit." – Jane C. Timm, "Gerrymandering is alive and well. The coming battle will be bigger than ever." NBC News, December 28, 2019 (emphasis added).

- Social Government Titles: The Social Titles represent the ideals held by the majority of the population (the 'ideal culture' in sociological terms), the way they regard themselves historically and philosophically, their identity. Social Titles answer the questions "Who are we?" and "What do we want?" The Conflict Check for each Social Title is based on the dual questions of how well the Title is fulfilling its own ideals and goals, and later, on how practically attainable those goals are in the current circumstances. Social Titles will tend to occupy larger, irregular shaped areas in the Public Space.
- Estate Government Titles: An Estate is a *cohesive and identifiable group* of people, organizations, or professions in a society that control a vital part of the functioning of the society, who are organized and recognize their potential power, have some leadership, and who actively apply or campaign to exercise or increase that power. Thus, an Estate Title represents a group that claims a share of the power due to their position in society. In any society there may be numerous, overlapping, and shifting Estates of different sizes, all claiming or vying for their share of the authority, trying to make their voices count; the Estate Title represents only the 'major Estates' who at the time the Estate Title is legitimate, control the authority in their society. Thus, the Conflict Check for each Estate Title is based on the goal of the Estate *remaining in power*, and whether or not the rest of society benefits from the Estate's continued power. Estate Titles tend to occupy smaller, regular shaped areas of the Public Space.
  - ✓ The historical inspiration for the Estates Government Title was the late French Estates General system and other similar late Medieval institutions that led eventually to established legislative bodies.
- Resources & Ideologies: A simplified version if you like, Estate Titles represent those who command the resources, while Social Titles represent those who command the ideologies and worldview. Those who have power, and those who have ideas. This does not imply that Estate Titles do not also foster, possess, or require a certain ideology or worldview, which is how Social and Estate Titles naturally overlap. They compete for and combine to form those who command legitimate authority in the civilization. They are not always mutually exclusive or at odds, but they are distinctly different functions, and thus must be regarded separately. In the classic European arrangement, the Church was the Social Title that provided legitimacy to the hereditary nobility and royalty who held Estate.
  - ✓ See discussion of sociopolitical origin of atheism in Europe in Legitimacy, 3 Government Titles, pp. 607-608, *infra*.
- New Kid in Town: The possibilities of Social and Estate Titles in the game are limited by:
  - 1) The words and concepts available to and understood by the designer and participants,
  - 2) What could conceivably work or be applicable to an interstellar civilization (as opposed to a planetary civilization), and,
  - 3) What can be expressed or translated into game terms, in the format in which this game is designed to operate, without granting any 'special powers' or creating new rules.

The game design obviously does not, and cannot, include every possible concept or idea, or every work ever written. Although some science-fiction literature has explored what sorts of governments might exist in the future, most of science-fiction continues with current governments or harkens back to older forms (e.g., Galactic Empires, monarchy, dictatorships, Republics); everything is the same in heaven as on Earth, rarely is anything better.

*“The tide turned and the war began to go against the English. This was due in great part to the influence of a young French peasant girl, Joan of Arc. Inspired by the belief that she had been given a mission by God to deliver France from its invaders and to place the Dauphin on the throne of his fathers, she appeared before him, secured his reluctant consent to allow her to lead some troops, inspired them with her own enthusiasm and confidence, and won a great success by driving away the English who were besieging Orleans. The Dauphin himself was then stirred to greater activity and under the persuasion of the Maid of Orleans, as she came to be called, made his way to Rheims, the ancient coronation city of the French kings, and was there crowned king of France. Joan now felt that she had fulfilled her mission and asked to be allowed to return to her home, but the Dauphin insisted that she should remain with the army.*

*Sometime after this she was captured by the English. After a trial which was planned to end in but one way she was burned as a witch in the marketplace of Rouen. Even one of the persecutors of the innocent French patriot girl wavered and turned away, crying, ‘God have mercy upon us, we have burned a saint.’ The movement of success which Joan had begun continued, and although the French frequently wasted their opportunities, yet on the whole the reconquest of their native land went steadily on. The English were driven out of one province after another; their expeditions from England were more poorly equipped and more unsuccessful. Finally the long war came to a close in 1453 by the defeat of an English army near Bordeaux, and the loss of all their territory in France except Calais.”*

– Edward Potts Cheyney, *A Short History of England* (1904), p. 269 (emphasis added)

**The Trial of Joan of Arc:** Medieval society, due to the late Roman and post-Roman Christianization, seems to have had the most direct and literal reliance on symbols: artifacts, places, and persons. This is the distinguishing feature of the European medieval period; there really were no competing ideologies or any such ideologies were subsumed under dynastic claims (the Renaissance and Reformation then stands as the emergence of competing ideologies in Europe).

A striking example is the affair between Henry VI and Charles VII. Henry VI, the 10-year old son of Henry V of England, was crowned as King of France at Notre Dame in English occupied Paris in 1431 (he had been King of England since 1422). Seven-year old Charles VII, who had been disinherited by his father, was escorted by 17-year old Joan of Arc to Rheims cathedral in 1429 to be crowned as King of France. Rheims cathedral was the usual place of coronation of French kings and thus, in addition to being the surviving son of Charles VI, Charles VII had the stronger claim to legitimacy and the ‘blessing’ of Joan of Arc. Meanwhile, the English Court of Henry VI was consumed with corruption, intrigue and Henry’s bouts of insanity leading to the War of the Roses and death of Henry VI while imprisoned in the Tower of London in 1471.

- ✓ “Of the love or hatred God has for the English, I know nothing, but I do know that they will all be thrown out of France, except those who die there.” – Joan of Arc, Trial records, March 15, 1431.

Joan of Arc was captured by the Burgundy faction, sold to the English and executed as a witch or heretic about a year and a half later in early 1431. Joan of Arc’s trial helped destroy any English

legitimacy in France. It was a political stage act, it broke every rule of ecclesiastical court procedure in that day, the court altered the transcripts of her testimony against her favor, fabricated evidence, and invented crimes on the fly, and it was considered a hideous affair even by the English (similar to Roland Freisler's People's Court in Berlin). All involved must have seen Biblical parallels which placed them on the wrong side of history and the English seemed to have taken extra precautions to insure she was really dead and had her body destroyed.

Further, by keeping her in a secular prison instead of confining her with nuns, the English left themselves open to charges of rape, and in fact, she did allege during her trial an attempted rape by an English Lord who entered her cell as well as groping, torment, and attempted rape by commoner English guards.

*“A movement is pioneered by men of words, materialized by fanatics and consolidated by men of actions.”*

– Eric Hoffer, The True Believer: Thoughts on the Nature of Mass Movements (1951)

---

## Endnotes.

<sup>1</sup> Commentary & Citation: Consider the following: “After nearly fifty years of practicing law it was really a relief to give so much of myself for a time to the questions that interested me most. I never missed a chance to speak or write against prohibition. It was a matter of fighting for the liberty of the individual. I had no delusions about mankind in general. I knew his origin and the method by which he received his ideas and opinions. I knew the weakness of his intelligence, his narrow experiences, his misinformation on all questions pertaining to life, the depth of his prejudice, and his inordinate conceit; and yet I liked him. Never did I blame him, but I always feared him. In the hands of the powerful and crafty he is like clay in the grasp of the potter. Under the leadership of the tyrant he is dangerous to the peace of the world. I enjoyed talking on social, political, and religious problems particularly. I wanted to make converts. I wished to make every one reasonable and tolerant. To be sure I realized that what really drew me to these endeavors was the self-satisfaction that I got out of it all, and so I am aware that it has not been a desire to help my fellows nearly so much as to gratify certain feelings of my own.” – Clarence Darrow's memoirs on the Sweet Trials, from his book, The Story of My Life (1932), Ch. 34.

- ✓ See Edward Bernays quote, 1 Culture, EN 1, p. 359, *supra*.
- ✓ Mr. Darrow most certainly was aware of and probably had read both Bernays and Lippman, his contemporaries, whom he seems to echo here. The writings of these three together might be taken as representing an intellectual pessimistic realism in post-WWI America.
- ✓ The other attraction of this quote that perhaps led to its inclusion (other than as stated above) here is that I concur in the opinion expressed by Mr. Darrow and likewise confess, with far less eloquence, the complicity of designing GGDM with my own satisfaction and gratification. See also 4 Culture, EN 2, p. 418, *supra*; Mr. Darrow and I are both talking about a sort of self-actualization.

<sup>2</sup> Commentary: To the extent that anyone else can tell you what to do or not do, you are less sovereign. Sovereignty is generally treated as zero sum by those holding it, and the extent to which you accept sovereignty as a zero-sum quality defines your theory of sociopolitical relationships.

<sup>3</sup> Commentary: The presence of two police officers – agents of the state who have legitimate authority to use physical violence – was key during the hostile rescue of Raja the Elephant in 2014. The owner and his friends were intent on intimidating the approximately 30 forestry officers, veterinarians and animal handlers involved, and on physically blocking the animal from being taken. But they were not willing to risk death, injury, or criminal punishment to block the enforcement of a court order for seizure of the animal. The police presence created room for rescue.

<sup>4</sup> Citation: “The two legal entities ... *Senātus* and the *Populus Rōmānus*, are sovereign when combined. However, where *populus* is sovereign alone, *Senātus* is not. Under the Roman Kingdom, neither entity was sovereign. The phrase, therefore, can be dated to no earlier than the foundation of the Republic. This signature continued in use

under the Roman Empire. The emperors were considered the *de jure* representatives of the people even though the *senātūs consulta*, or decrees of the Senate, were made at the *de facto* pleasure of the emperor. *Populus Rōmānus* in Roman literature is a phrase meaning the government of the People. When the Romans named governments of other countries, they used *populus* in the singular or plural, such as *populī Prīscōrum Latīnōrum*, ‘the governments of the Old Latins.’ *Rōmānus* is the established adjective used to distinguish the Romans, as in *cīvis Rōmānus*, ‘Roman citizen.’

The Roman people appear very often in law and history in such phrases as *dignitās, maiestās, auctoritās, libertās populī Rōmānī*, the ‘dignity, majesty, authority, freedom of the Roman people.’ They were a *populus liber*, ‘a free people.’ There was an *exercitus, imperium, iudicia, honorēs, consulēs, voluntās* of this same *populus*: ‘the army, rule, judgments, offices, consuls and will of the Roman people.’ They appear in early Latin as *Populus* and *Populus*, so the habit of thinking of themselves as free and sovereign was quite ingrained. The Romans believed that all authority came from the people. It could be said that similar language seen in more modern political and social revolutions directly comes from this usage. People in this sense meant the whole government. The latter, however, was essentially divided into the aristocratic Senate, whose will was executed by the consuls and praetors, and the *comitia centuriāta*, ‘committee of the centuries,’ whose will came to be safeguarded by the Tribunes. One of the ways the emperor Commodus (180–192) paid for his donatives and mass entertainments was to tax the senatorial order, and on many inscriptions, the traditional order is provocatively reversed (*Populus Senatusque...*)” – from Wikipedia article, “SPQR,” captured September 27, 2018.

<sup>5</sup> **Commentary & Citation:** The concept of sovereignty is perhaps demonstrated by the appointment of military commanders by essentially subletting or conferring a degree of sovereignty upon the person of the commander, e.g.:

- ✓ “In April, the diploma by which Suleiman confirmed Ibrahim Pasha’s appointment as *serasker* included the following: ‘Whatever he says and in whatever manner he decides to regard things, you are to accept them as if they were the propitious words and respect-commanding decrees issuing from my own pearl-dispensing tongue.’ Quoted by Rhoads Murphey in *Ottoman Warfare 1500–1700*, p 136.” – from Wikipedia article, “Siege of Vienna” (1529), n. 10, captured December 22, 2018.

The President of the United States is not a sovereign person, but is appointed by the Constitution as the Chief Executive and the Commander-in-Chief of the Armed Forces of the United States. The essential element, sans sovereignty, of transfer of authority remains; the President is responsible for the commissioning of officers and appointment of commanders under his command, though this process now has little actually to do with the President. But the concept is still a part of the oath of enlistment (which I have taken a few times) of the United States armed forces (excepting the National Guard oath which is slightly different):

- ✓ “I, \_\_\_\_\_, do solemnly swear (or affirm) that I will support and defend the Constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; and that I will obey the orders of the President of the United States and the orders of the officers appointed over me, according to regulations and the Uniform Code of Military Justice. So help me God.” (Title 10, US Code; Act of 5 May 1960 replacing the wording first adopted in 1789, with amendment effective 5 October 1962). From army.mil, the website of the U.S. Army, December 22, 2018.

It is notable that the oath first demands loyalty to the Constitution of the United States, the document of the sovereign nation, followed in due order, by an oath to obey the orders of officers appointed by the President. The President of the United States does not exist without the Constitution and has no authority without the Constitution, and thus is not a sovereign person.

<sup>6</sup> **Commentary:** See King Arthur’s encounter with the Annoying Peasant in Monty Python and the Holy Grail!

<sup>7</sup> **Commentary:** Philosophical ruminations about the ultimate source and nature of sovereignty should not be construed in any way as supporting the so called “sovereign citizens movement,” which I regard as utter nonsense in all its forms. ‘Sovereign citizens’ are people who want to manufacture an excuse to do whatever they want, weasel-worded anarchist wannabes, without consequence or responsibility – usually after they are caught by law enforcement. They are people who want to enjoy the benefits of civilization – roads, technology, goods and services, commerce, culture, emergency medical assistance, peace and good order – without doing their part, paying their fair share, and being responsible. They are the warped adult version of the juvenile who whines, why do I have to go to school (this is slavery!), why do I have to mow the grass if it’s all going to die in the fall, why do I have to shovel the snow ‘cause it’s all going to melt in two months anyway?

<sup>8</sup> **Commentary:** Considering the hatred of the French occupiers by the native population, why did the FLN lose? Of course, there were great material and manpower differences between the opposing forces, but the FLN was waging an offset campaign and should have at least survived. However, it is the classic conundrum of ‘terrorist’ resistance: 2 Government Titles – Earthly Entanglement

How can you convince the population that you are fighting for them when civilians are being killed by your planted bombs? When it is the civilian population who are being terrorized, essentially caught between sides and just wants it to end? This is the danger of radicalization of resistance, the more radical they are, the less likely they are to inspire support or even a general uprising. Radicalization leaves them isolated, with no exit, except death.

- ✓ In May 1958, General Jacques Massu, who had come to resent what the French had done in Algiers, was the leader of a military coup d'état that seized control of Algiers, then Corsica, and caused the collapse of the Fourth Republic in France, eight months after they had destroyed the FLN and 'won' the Battle of Algiers. So the victorious military leaders of one day became the rebels of the next day ... not uncommon in history.
- ✓ Three years later, in 1961, a group of four retired generals with some other officers (supporters of de Gaulle in 1958), organized another coup d'état to try to force the French de Gaulle government to stop negotiations for the independence of Algiers. The widespread use of transistor radios allowed the soldiers in Algeria to hear news from France that was not controlled or screened by their officers, which may have caused them to refuse to join the insurgent coup. This is a case where technology affected the outcome of a dicey affair.

<sup>9</sup> Citation: "When population in the Preclassic became sufficiently dense that productivity fluctuations were a matter of serious concern, the solution to each local group so affected must have been obvious: raid neighboring groups to make up a deficit. Since the only alternative over the short-term was famine, the development of warfare ... was entirely expectable. Long-term solutions included agricultural intensification and the establishment of a hierarchically managed economy. These were not permanent solutions, however, for the archaeologically-evident pattern of population growth indicates that, with each establishment of a higher-capacity production system, population simply rose further. The military option must have been perpetually tempting.

The establishment of competitive relations among local Mayan groups had important implications for the further evolution of ... society. It is no accident that population pressure, warfare, and sociopolitical complexity emerged together in the Middle and Late Preclassic and the Protoclassic, for as Webster has argued, they were systemically related (1976a, 1977). Organization for the initiation, conduct, and resolution of war provided a significant managerial/leadership role that contributed to the emergence of a social hierarchy. Economic stratification resulted from success at war, as the bounty of a successful campaign was subject to expropriation and distribution by the leadership (Webster 1976a, 1977: 349-51).

Although major fortifications did exist, the majority of conflicts (if they were indeed related to subsistence stress) would have involved raids on fields, as crops neared maturity, and on peasant villages and storage complexes, after the harvest. The insecurity that this created among the rural population selected for nucleation around secure, regional centers (Sanders 1981a: 361; Webster 1977: 348). This in turn further intensified subsistence stress, as populations aggregated into smaller areas, leaving large hinterlands with comparatively fewer people and less agricultural production (Webster 1977: 348)...

Complex feedback relations emerged among agricultural production, conflict, and complexity. Productivity fluctuations made military adventures tempting, even essential, while in turn military strategy came to influence agriculture. Dispersed, shifting swidden plots were essentially indefensible (at least at any reasonable cost), and yet were highly vulnerable and essential to subsistence. Concentrated, intensive systems, such as raised fields and terraces, were at the same time more easily defended (being compact, concentrated, and stationary) and productive enough to be worthwhile defending. The same consideration applies to centralized storage facilities. While it would be simplistic to suggest that warfare was the sole reason for agricultural intensification, it certainly made intensification that much more attractive. (And of course once present, such capital assets make tempting targets [Webster 1976a: 111, 1977: 367-8].) Similarly, management of conflict was probably not the only reason for the emergence of sociopolitical hierarchies, but both directly (through the need for military leadership) and indirectly (through the need for labor mobilization and agricultural management), it certainly influenced their development." – Joseph Tainter, *The Collapse of Complex Societies* (1988), pp. 171-172.

- ✓ "The first set consists of continental differences in the wild plant and animal species available as starting material for domestication. That's because food production was critical for generating large surpluses that could support non-farming specialists, and the buildup of large populations enjoying a military advantage over others. All developments of economically complex, socially stratified, politically centralized societies beyond the level of small nascent chiefdoms were based on food production. Pleistocene extinctions played a large part in the availability of domesticable animals, limiting options greatest in Australia and the Americas. In terms of technology, most societies acquired much more from other societies than they in-

vented themselves. Thus, diffusion and migration within a continent contributed importantly to the development of certain civilizations.” – Jared Diamond, Summary of Guns, Germs, and Steel (2017), p. 45, Kindle Edition.

- ✓ This is key to understanding also the plight of the Plains Indians as the white hunters wastefully decimated the bison population in 1872-1873 with long range rifles and intensive organized hunting to satisfy the demands of the east. They did not kill the bison for food – the whites had plenty of food – but to harvest certain parts that had high value in the markets. The Indians, birds, and wild dogs were left the carcasses to scavenge. In this light, it is understandable why leaders such as Comanche Chief Quanah Parker and Medicine Man Kwihnai Tosabitu (aka Isatai’i) were alarmed by the threat to their people’s existence, the threat of starvation due to the decimation of the bison, and the invasion of white settlers. This led to the Second Battle of Adobe Walls in June 1874, where hundreds of Comanche, Cheyenne and Kiowa warriors were defeated by a small group of white hunters with modern weapons and long-range rifles. A similar result occurred in September 1874 at the Buffalo Wallow Fight where two civilian scouts and four troopers held off over 100 Comanche and Kiowa warriors with accurate rifle fire, though five were wounded and one killed. Native American losses are disputed in both engagements but they were spiritually defeated.

<sup>10</sup> Commentary: Rotten eggs, have you ever smelled them? “Dirty Hands” and “Glove Cleaner” refer to an original Twilight Zone episode, but could just as well refer to Dirty Harry movies.

<sup>11</sup> Citation: “The Army is a broadsword, not a scalpel. Trust me, senator, you do not want the Army in an American city... Twelve hours after the President gives the order we can be on the ground. One light infantry division of 10,700 men, elements of the Rapid Deployment Force, Special Forces, Delta, APCs, helicopters, tanks, and of course the ubiquitous M16A1 assault rifle. A humble enough weapon until you see it in the hands of a man outside your local bowling alley or 7-11. It will be noisy. It will be scary, and it will not be mistaken for a VFW parade... I urge you – I implore you – do not consider this as an option.” – General William Devereaux “The Siege.”

<sup>12</sup> Citation: This entire volume of the Quarterly Review is in the public domain and has been digitized on Google Books, free to the internet public.

<sup>13</sup> Citation: From the *Congressional Globe*, 19<sup>th</sup> Century predecessor to the *Congressional Record*. Unfortunately the hundreds of pages of images from the record at <https://memory.loc.gov/ammem/amlaw/lwcglink.html#anchor36> are apparently not text searchable and display one page at a time for reading.

<sup>14</sup> Citation: However, see previous feature quotes by Frederick Douglass and Harriett Tubman that slaves didn’t know they were slaves, 3 Order, p. 546, *supra*.

<sup>15</sup> Commentary: As in the Concierge is always divine and always right!©

<sup>16</sup> Citation: Note that the Wikipedia article contains links to both the current and the 1911 Encyclopedia Britannica articles on the Lombard League. A comparison of those articles demonstrated that the Wikipedia article is more detailed than the 1911 Encyclopedia Britannica online article on the same subject. Yet, as mentioned previously, the former would not be accepted in many places whereas the latter would be authority without question in any school writing and research assignment paper.

<sup>17</sup> Commentary & Citation: Walter Jon Williams suggests that Dr. Paul Linebarger, one of the odder intellects of the science-fiction college, who taught at Duke University and John’s Hopkins Institute for Advanced International Studies in Washington, while he worked for the U.S. Government and wrote the manual on Psychological Warfare (Infantry Journal Press, 1948), wrote science-fiction stories under the famous pseudonym Cordwainer Smith to avoid government scrutiny of his fiction and that his fiction was not scrutinized because authorities at the time regarded the science-fiction genre as trivial, ridiculous and not worth scrutiny (consistent with the assertion of my white haired 12<sup>th</sup> Grade English teacher, in 1984 that science-fiction is not literature). See, Walter Jon Williams, “The What-He-Did: The Poetic Science Fiction of Cordwainer Smith,” October 7, 2016, Tor.com.

- ✓ The 1956 movie, Forbidden Planet, is considered a watershed moment in popular acceptance of science-fiction as literature. MGM, who had never made a sci-fi movie, jumped into the market. Two points distinguished Forbidden Planet: 1) the actors, directors and producers determined that they had to take the story *seriously* and 2) Forbidden Planet had a *serious budget* (along with astounding development of new techniques, sets, and post production) much larger than any of the previous (budget-starved) science-fiction movies. From “Everything you need to know about Forbidden Planet,” JonnyBaak YouTube Channel, August 1, 2019.

*“There is a natural and necessary progression from the extreme of anarchy to the extreme of tyranny, arbitrary power is most easily established on the ruins of liberty abused to licentiousness.”*

– George Washington, Circular Letter to the States (1783)

*“Liberty may be endangered by the abuses of liberty as well as by the abuses of power.”* – James Madison

**Tale of Two Revolutions:** Why didn’t the American Revolution implode, fragment, collapse, or become corrupted or diverted, as the French Revolution did twenty years later and so many others have done before and since? While some French people and Francophiles might be offended, no one can seriously argue that Emperor Napoleon was the *goal* of the revolution.

Suggested factors in favor of the American Revolution include the character of the leaders (level-headed, practical, educated farmers and businessmen of the Age of Reason), the frontier outlet, availability of resources, European self-preoccupation, protection of the seas, Protestantism, a break from the old world, the Enlightenment and a dose of geographic good fortune (*à la* Jared Diamond). Shay’s Rebellion and the Burr Conspiracy hint at what could have happened.

- ✓ “We seem convinced that majorities exist to impose their will with few concessions and that minorities exist to prevent the party in power from doing anything important. That’s not how we were meant to govern.” – Sen. John McCain, “It’s time Congress returned to regular order,” Washington Post, August 2017.

Note the date of George Washington’s Circular Letter to the States – *sixteen years* before Lucian and Napoleon Bonaparte’s coup of 18 Brumaire. Sixteen years before demonstration of his point in the land of America’s ally in the War of Independence when their revolution imploded.

- ✓ “A shabby compound of brute force and imposture, the 18<sup>th</sup> Brumaire was nevertheless condoned, nay applauded, by the French nation. Weary of revolution, men sought no more than to be wisely and firmly governed.” – Arthur William Holland, “The French Revolution” (Encyclopædia Britannica, 11<sup>th</sup> Ed., 1911).

I highly recommend reading about the events of both 18 Brumaire (1799) and 25 Luglio (1943), in the former, the lack of reaction on the streets of Paris from the obvious coup d’état sanctified the end of the Revolution and a weary return to absolutism, in the latter case, the Italian public poured into the streets after the late night announcement and celebrated the fall of the Fascist regime.<sup>1</sup> And in 1660, Charles II returned without opposition to England weary of radicalization.

- ✓ “And the men who spurred us on, sit in judgment of all wrong, they decide and the shotgun sings the song.” – The Who, “Won’t Get Fooled Again” (1971).

Successful coups *d’état*, putsches and revolutions, of necessity, *must retroactively legitimize* whatever process, violence or atrocities occurred during the revolution, regardless of political or social cost to the new regime. Had the American Revolution failed, the Declaration of Independence would be an obscure historical document. Revolutions also frequently feature lies, deceptions and falsehoods and questionable ethics (for example, the Amethyst incident in 1949, or the Great Leap Forward and subsequent Great Chinese Famine), and/or a cast of unsavory characters

(such as Aaron Burr or Han Solo), which acts are all justified by or in the name of the greater cause.

---

*“Al-Otaybi had turned against Bin-Baaz and began advocating a return to the original ways of Islam, among other things: a repudiation of the West; abolition of television and expulsion of non-Muslims.’ He proclaimed that ‘the ruling Al-Saud dynasty had lost its legitimacy because it was corrupt, ostentatious and had destroyed Saudi culture by an aggressive policy of Westernization.’”*

– from Wikipedia article, “1979 Grand Mosque seizure,” quoting Robin B. Wright, *Sacred Rage* (2001) <sup>2</sup>

---

**Legitimacy:** Legitimacy is a test of whether or not a Government, and hence the government’s authority, is generally regarded as *legitimate* by the civilization that it governs; legitimacy is “the quality of state of being legitimate.”<sup>3</sup> Legitimate relates to being regarded as true to purpose, lawful, and/or conforming to accepted principles (in part, the ‘legal-rational authority’); that is, what is “legitimate” is based solely on an interpretation of the people within their cultural framework (related to morality, ideology), and not an objective reality.<sup>4</sup>

- ✓ The Revolt of the Comuneros (1521-1522) in Castile, Spain, against Charles V (Holy Roman Emperor mentioned in Unintended Consequences, 2 Entropy, p. 236, *supra*) provides a good example of legitimacy and revolts of the period. The rebels gained legitimacy by claiming to fight for Queen Joanna of Castile (Queen Doña Juana, mother of Charles V, aka Joanna the Mad) as a rightful monarch of Castile (her pushy brother was King Ferdinand II of Aragon). The rebel commander, Pedro Girón, maneuvered himself out of position and opened the way for the Royalist forces – stealing a night march – to capture Tordesillas where Joanna had been confined by her brother on claims of insanity; you can envision this being a very bad chess move (i.e. ‘fool’s mate’). With the loss of Queen Joanna, the rebel’s claims to legitimacy (in the view of that period) vanished (cf. to modern people’s revolutions). Girón resigned command, and somehow avoided being executed by either side; he spent his remaining days in exile in Africa commanding forces against the Moors. Today, the Revolt of the Comuneros remains a *symbol* to Castilian nationalist of revolt against foreign rule.

Most legitimacy occurs in the form of passive acceptance of the *status quo*, ‘the way things are’ even to the point of creating divine<sup>5</sup> or cosmic reasons supporting the order of things or the rule of a particular group.

- ✓ For example, the MLA has legitimacy as the authority on style and grammar in the English language simply because all of the colleges require their students to buy and abide by the MLA style handbooks. No one ‘elected’ the MLA to be the authority on English style and punctuation (for example, the mid-1980s decision that the period goes inside the quotation marks and not outside, as I was taught in high school); they simply ‘are’ (i.e. were *de facto* appointed by college professors and editors) because of their established reputation which is perpetrated each semester upon unsuspecting college freshman and high-school students. The DSM is another example. And so is Merriam-Webster dictionary; if Merriam-Webster shows an entry as hyphenated, e.g., ‘spin-off,’ then it’s hyphenated, whereas if it doesn’t, e.g., ‘godlike’ instead of ‘god-

like,’ then it is not. You can cite the MLA and Merriam-Webster dictionary in any school paper grading argument and probably will win.

So globally entrenched are modern democratic ideals that non-democratic forms of government are usually considered automatically autocratic regimes who seek to suppress all dissent (which includes democratic leanings) and hold show trials, or hold sham elections in a bid for internal and external legitimacy. Legitimacy in the past has often been achieved by combining religious and secular authority into one person or marriage (e.g., king weds high priestess, the Papal States, 15<sup>th</sup>-century bishops<sup>6</sup>).

The ability to grant legitimacy literally became a business which was abused to licentiousness by most Popes in the late medieval period. While the Roman Senate had long been the grantor of legitimacy (e.g., Odoacer, Herod the Great), or sometimes the Praetorian Guard (e.g., Year of the Five Emperors, see Household Troops, 6 Government Titles, p. 653, *infra*), as the glow or shadow of the Empire faded, the Pope became more palatable as the adjudicator of legitimacy in Christian Europe.

A good example of this is shown by the War of the Sicilian Vespers:

- ✓ “Pope Alexander IV literally shopped around for a buyer for the crown of Sicily. In 1256 King Henry III of England agreed to buy the crown for his son Edmund for 135,541 German marks. He raised secular and church taxes in England and paid the Pope 60,000 marks, but could raise no more. The people and clergy of England refused to be taxed any further to enable an English prince to sit on the Sicilian throne. On December 18, 1258 Pope Alexander issued a bull releasing Henry from his obligation to buy the throne, but he kept the 60,000 marks already paid (cf. Runciman, Chapter 4).” – from Wikipedia article, “Sicilian Vespers,” captured November 21, 2018 (referencing Steve Runciman, The Sicilian Vespers: A History of the Mediterranean World in the Later Thirteenth Century, 1958).

It is certain that no one consulted the residents of Sicily on this matter, and thus the residents of Sicily were treated in a manner similar to shop employees whose new manager is appointed by the large business owner. The business of the Pope was selling ultimate legitimacy and the business of the nobles was local power and wealth. The commoners were just employees in the great enterprise of Western civilization and I believe that this generally describes the arrangements that we now call feudal Europe. The change from subjects to citizens in the west was the shift in the legitimacy granting power from Popes and Kings (via appointments and charters) to the people, when they began to assert themselves by force of arms (see Subjects and Citizens discussion, 2 Government Titles, p. 599, *supra*).

- ✓ “[Atheism] had only a limited amount to do with reason and even less with science.... In reality ... modern atheism was primarily a political and social cause, its development in Europe having rather more to do with the (ab)use of theologically legitimized political authority than it does with developments in science or philosophy.” – Nicholas Spencer, Atheist: The Origin of the Species, as quoted in Michael Robbins, “Atheists Used to Take the Idea of God Seriously. That’s Why They Mattered.” Slate Magazine, July 8, 2014.

- **Legitimacy & Authority:** Legitimacy is the first question of authority, just as jurisdiction is always the first question of any court of law. It simply cannot be avoided, they are axiomatic. Both are externally determined; a court cannot grant itself jurisdiction and an authority cannot grant itself legitimacy, not even by claiming divine sanction. The source of legitimacy is always the consent of those who are governed, regardless of what is claimed by those in power; for example, the legitimacy of a theocracy is the faith of the followers that allows the clerics to rule, not the power of some imaginary deity. In general, legitimacy of authority and government is that essence that captures the faith, confidence and hope of the majority of the governed, or at least, their passive acceptance of the current situation.
- ✓ The irony was not lost on anyone either inside or outside of the ‘workers’ paradise’ of Eastern Europe that protests were crushed by occupying Soviet troops, and the use of force blamed on the West. Loss of legitimacy is an inescapable cognitive dissonance.
- Consider the scene in the movie *Lawrence of Arabia* (1962). A member of one tribe kills another in a dispute. Immediately, the situation threatens to break into an open melee between the tribes, endangering the coalition that Col. Lawrence had assembled. He fires his pistol to get their attention and then intervenes: “The Law says the man must die.” After receiving assurances from the chiefs, he declares, “Then, I will execute the Law. I have no tribe and no one is offended.” The man he executed with his pistol is the man whose life he had previously saved (Ali: “That man he killed was the man he brought out of the Nefud.”) suggesting a circumstantial circle, but more importantly, in doing so, he placed himself above the tribal laws (in much the same way as the state) and their acceptance of this legitimized his authority was by at the minimum, passive acceptance.<sup>7</sup>
- ✓ “I have asked some of the Great White Chiefs where they get their authority to say to the Indian that he shall stay in one place, while he sees white men going where they please. They cannot tell me.” – Chief Joseph, a leader of the Wal-lam-wat-kain (Wallowa) band of Nez Perce Native Americans.
    - The return of the Diaspora to Palestine and the re-founding of Israel is a similar enough situation that the Palestinians in Gaza might ask the same question, feel the same way.
    - If my housecats, who have been in my house since they were all kittens, had the cognition and the communicative ability they might ask me the same, why must they stay in the house while they see other outside cats going where they please? On what authority do I keep them in the house?
    - The lawn and hedges might ask the same, why do they need to be trimmed and shaped when other bushes and grasses in empty lots and around abandoned, condemned houses, grow unhindered?
- **Sovereignty & Legitimacy:** Legitimacy should not be confused with official recognition by foreign entities and governments. In theory, recognition by foreign governments should not *matter* for internal legitimacy – but it does when related to sovereignty (as Napoleon III learned).<sup>8</sup> It is perhaps, by a stretch, similar to pitch framing by the catcher in baseball: Where the catcher’s glove ends up should not have any bearing on whether the pitch is called a strike, but everyone thinks it does influence the umpires’ determination of a called strike.

- ✓ The situation in Somaliland is illustrative. Somaliland succeeded from Somalia in 1991 at the beginning of the Somali Civil War, it has been *de facto* independent, stable and relatively calm (as opposed to the rest of Somalia) but *has not been recognized* by any foreign government (the opposite of Justice Jackson’s ‘quasi-state’). The region immediately south, Puntland, has been autonomous at various points since 1991, but has been at other times under control of the government.

This principle is also the reason why puppet regimes and foreign proxies have difficulty obtaining internal legitimacy:

- ✓ Herod the Great of New Testament infamy, was appointed King of Judea by the Roman Senate and then was sent to unseat another usurper backed by the Parthian Empire (making their internal fight a proxy war between two massive empires over a client state). Being appointed King by an external conqueror, along with other factors leading to questions of his Jewish piety, made Herod’s legitimacy tenuous at best. The Romans, who were masters of this game and held most of the trump cards, knew exactly what they were doing in appointing Herod as King of Judea. The New Testament’s Massacre of the Innocents, whether historically accurate or not to any degree, demonstrates Herod’s faltering legitimacy and he certainly would have had good reason to fear a prophecy of another one claiming to be King of the Jews (such a prophecy in this case acts like the knight in chess).
  - See also Prophecy discussion, 2 Wheels in the Sky generally, *infra*.

There could occur many similar legitimacy situations in the game on both the small planetary scale and on the interstellar scale as powers become entangled; situations for which the Concierge can and should exercise judgment beyond the formal checks of the game.

Thus, a government is not ‘true to purpose’ if the government cannot maintain sovereignty or meaningfully engage other powers in diplomacy and trade. Legitimacy can be lost or tarnished if sovereignty is violated, it cannot control trade, or the government is humiliated by foreign powers, for example, China (rightly) regards the 19<sup>th</sup> Century as the “Century of Humiliation.” See Opium Wars discussion, 3 Commerce, p. 1216, *infra*.

- ✓ **Dr. Who to Prime Minister Harriet Jones:** “I can bring down your government with a single word.” – Dr. Who, “The Christmas Invasion” (2005).
- **Samurai Crabs:** The most immediate connection between sovereignty and legitimacy is military victory, the most instant failure of legitimacy is a military defeat that destroys sovereignty and prestige (the three are inextricably intertwined). Thus, many conflict checks in GGDM relate to military victory, defense preparedness and prestige. Regarding the Battle of Tsushima, May 1905:
  - ✓ “Imperial Russia’s prestige was badly damaged and the defeat was a blow to the Romanov dynasty. Most of the Russian fleet was lost; the fast armed yacht Almaz (classified as a cruiser of the 2<sup>nd</sup> rank) and the destroyers Grozny and Bravy were the only Russian ships to reach Vladivostok. In The Guns of August, the American historian and author Barbara Tuchman argued that because Russia’s loss destabilized the balance of power in Europe, it emboldened the Central Powers and contributed to their decision to go to war in 1914. The battle had a profound cultural and political impact upon Japan. It was the first defeat of a European power by an Asian nation in the

modern era. It also weakened the notion of white superiority that was prevalent in some Western countries. The victory established Japan as the sixth greatest naval power while the Russian navy declined to one barely stronger than that of Austria-Hungary.

In The Guinness Book of Decisive Battles, the British historian Geoffrey Regan argues that the victory bolstered Japan's increasingly aggressive political and military establishment. ... Regan also believes the victory contributed to the Japanese road to later disaster, 'because the result was so misleading. Certainly the Japanese navy had performed well, but its opponents had been weak, and it was not invincible... Tōgō's victory [helped] set Japan on a path that would eventually lead her' to the Second World War." – from Wikipedia article, "Battle of Tsushima," January 15, 2019.

The destabilization of the balance of power in Europe by the Russian Baltic Fleet's defeat in Asia is a point not to be lost either in the current world or in the reach of star-spanning civilizations of GGDM. From a legitimacy point of view, the Soviets had to defeat the Japanese at Khalkhin Gol in 1939 or be seen as another Russian government that lost to the Japanese.

In GGDM terms, this game-changing, stunning defeat might translate as Disruption Checks, inactivation of Constructural Elements, failure of Conflict Checks and possible disruption of Government Titles, near annihilation of the main warfleet of the losing position in two Combat Rounds, after a long movement to the combat zone, losses of Acts, Scenes, Power Activations by the losing position, encouragement of other positions, encouragement of continued aggression by the victor, inability to protect smaller colonies, Cargo Ships, Colony Ships by the defeated power. We all know what happened in Russia in 1917 after more defeats.

- ✓ When Napoleon III overthrew the Second Republic to establish the Second French Empire (1852-1870), it is certain that there was a significant segment of the French population – the Victor Hugo crowd (see 4 Colleges, bottom p. 507, *supra*) – who thought, 'oh no, here we go again'; it would have seemed a step backward for France. It was predictable that in order to reestablish the absolute monarchy, the leadership would seek military adventures for glory and public distraction. Indeed, it soon followed that France won territory from Austria in a war over Italy (just as in 1796-1797 under Napoleon Bonaparte, before he embarked for Egypt) but infuriated the Pope and French Catholics, and failed to oust the Austrians; then involved itself in military adventures in Crimea, Syria,<sup>9</sup> China, and Mexico.

But there were a lot of moving parts, both internally and internationally, Machiavelli would say that Napoleon III never really established as Emperor of France. He was forced to make concessions, easing restrictions on the press, appealed to the masses, re-empowered the legislature, and the liberals, signed a trade union with the UK that hurt French industry, blundered in Italy, and failed to check the rise of Prussia, which was his doom in 1870 when he personally surrendered to the Prussians at Sedan. Having failed before the Prussian invasion, he lost legitimacy and moved to England where he lived out his days, while Wilhelm I, King of Prussia, was crowned Emperor of Germany at Versailles in 1871.

*“But what happens if there is no clear choice? Under the thin veneer of clear choices, the component worlds, nobles, businesses, and citizens of the Imperium harbor a maze of conflicting priorities and allegiances.”*

– MegaTraveller RPG, [Rebellion Sourcebook](#) (1988)

**Status Quo:** The *status quo*, in most cases, is the natural and automatic choice. This also reaches to Conversion and Naturalization; as the generations of captivity pass, faith, hope and confidence in their previous governing power fade. Even animals domesticated from the wild become accustomed (like my housecats, all but one of whom I caught as feral kittens), sadly often to their own detriment, even when abused and neglected.

- ✓ “Well, consider this. If a teacher asks a boy in front of the whole class if his father came home drunk again the night before, is the boy obliged to answer ‘yes’? No. Exactly, the teacher is abusing his power in asking the boy that question. The honest answer is for the boy to lie, defending his father. And lie for all he’s worth.” – Dietrich Bonhoeffer, *Bonhoeffer: Agent of Grace* (2000).<sup>10</sup>

Because most humans at least respect immediate authority, that rising dictatorships and fascist powers can jail opposition leaders with little actual resistance, gaining a large foothold on power.

- ✓ “If you put fleas in a shallow container they jump out. But if you put a lid on the container for just a short time, they hit the lid trying to escape and learn quickly not to jump so high. They give up their quest for freedom. After the lid is removed, the fleas remain imprisoned by their own self-policing. So it is with life. Most of us let our own fears or the impositions of others imprison us in a world of low expectations.” – John Taylor Gatto.<sup>11</sup>

There are arguments that legitimacy exists when there is only one clear choice and that choice is to support the *status quo*, the existing government system. On some level, this is true and required, it is a useful observation, but I feel that this definition alone only creates a grudging, surface legitimacy (e.g., Mike + The Mechanics, “Silent Running”); it is the type of definition that legitimizes control by foreign powers and tyrannical or otherwise repulsive regimes as long as there is no other choice (which can be created by oppression). Even the *Ancien Régime*, monarchy by primogeniture, required more than this, they needed the Church to legitimize the process.

The visible government in GGDM consists of the Structural Title, which provides the overall umbrella under which various social groups tussle and elbow for power (Estate Titles) and control of social ideologies (Social Titles) with the end result being some sort of worldview, national identity, and policy. This is clearly a constitutionalist view of government – which may not in the past have been shared by much of humanity – but the U.S. Constitution simply formalized a process that had begun generations earlier in Europe and has spread globally in the generations since. Nearly every nation-state has a written constitution now, whether or not it is followed.

- ✓ In one of the cases I worked on in a rural county of Western Pennsylvania, I downloaded the local Rules of Court, read them and followed the procedures. It didn’t work. When I spoke to the lady at the Prothonotary’s Office, I told her that I followed the rules. Her reply? That’s not how we do it, ignore the Court Rules, this is what you need to do...

- Kings, Queens, and Guillotines: The most basic form of legitimacy in tribal societies and monarchies, is that what is good for the king is good for the tribe or kingdom. This concept flows then to conquest and marriage; a successful king will attract followers who want to benefit from his success, and as the king is expected to take care of his own family first, marriage into the family becomes a most attractive option as well. This rationale continued almost uninterrupted until the mid-19<sup>th</sup> century in Europe, until dynastic wars and multiplying political, state, economic, religious, scientific, population, and cultural complexities pushed the concept to abstraction and collapse.
- ✓ The situation of Napoleon III is informative; France in the late 19<sup>th</sup> Century was a much different, probably more complex society than France in the late 18<sup>th</sup> Century, due in large part to the French Revolution and the experience of Napoleon I, and of course, rapidly increasing international complexity and technology.
    - “Marxist sociologist Göran Therborn has characterized the reign of Napoleon III as the ‘first modern bourgeois regime,’ one which combined a movement of mass support with ‘bourgeois’ rule, albeit through authoritarian statist means. According to Therborn, such a form of rule, ossified upon the point of crisis, proves fatal to such regimes once major external crises emerge, inevitable under Marxist exploitation theory.” – cited in Wikipedia article, “Napoleon III.”

Thus, Napoleon III found it much harder to establish absolute monarchy than did Napoleon I (see also George Washington quote above).

The final collapse was called World War I. It is now called a *conflict of interest* where the pecuniary and familial interests of the executive might exert influence on decisions of state. Nonetheless, monarchy has been a popular form of government in space-opera fiction; many have questioned whether an interstellar civilization could be held together without ironfisted monarchy of starships and heroic-princely captains, and much of imperial space-opera fiction reflects the basic ancient Earth rationale described above (and it makes for great drama in any case). But such stories also always carry with them the 19<sup>th</sup> Century (the beginning of SF) tensions that finally collapsed the monarchical systems: Complexity, untamed frontiers, dynastic and personal feuds.

---

*“Kings and queens and guillotines  
Taking lives denied  
Starch and parchment laid the laws  
When bishops took the ride  
Only to deceive”*

– Aerosmith, “Kings & Queens” (1977)

---

**Starch & Parchment**: Each Magna Carta (see The Duality, 1 Government Titles, p. 584, *supra*) contains a list of between one and four Conflict Checks. Each Conflict Check describes a condition that must be true or false in order for the government to maintain legitimacy.

- ✓ “The gist is, when you look at individual versus group framing, there is a very long history of people acting in ways that don’t seem to be optimized at their individual

level, but are optimized for their group. And as a result, they perceive that it will confer benefits on them.” – David Pakman talking about Jonathan Haidt’s theory, David Pakman Show, May 13, 2020.

The conditions described by each Conflict Check will be based on *objectively verifiable* conditions within the game, such that there should be little dispute about whether or when the conditions have not been met (i.e. when the Conflict Check fails). It is thus that governments seek to establish and maintain the *status quo*.

- ✓ Examples of Conflict Checks might include, Construction Power must have been activated within the last two Regular Turns, no other Government Titles are disrupted, Capital Colony must be the largest colony in population, alien population of position cannot exceed more than 10% of total population, position does not have any colonies on Balkanized Planets, etc. Each of these is objectively verifiable, if they are not true, then the Government Title *may* become disrupted if all Conflict Checks fail. The above examples may fail either voluntarily, through negligence, or through the acts of other positions.

In game play, Conflict Checks are not much different than any other game; in any game, there are things that a player must do, must avoid doing, and must not allow to happen. That is part of the definition of a game. For example, in the 1976 James Dunnigan classic game Panzergruppe Guderian, the Soviet player – to legitimately be the Soviet player – cannot allow the capture of Smolensk without stiff resistance and without bleeding the Germans severely in time and losses; all else in the game revolves around that.

- ✓ A position is not prohibited from an act or failure to act which will cause a Government Title to fail a conflict check or even to become disrupted.
  - ✓ A position may be required to or prohibited from acting in a certain way due to ***Fundamental Realities***, which always hover in the background behind Conflict Checks.
- Esteem & Prestige: Esteem and prestige are important elements of legitimacy (and diplomacy), to wit:
- ✓ “This is not mere mysticism. Most important institutions are protected and empowered by esteem. To the cynic, a judge is an average woman in a robe; a general is a poser in a costume; a priest is a balding man with sweat staining his armpits. But however accurate these depictions, they are not true. Because of the institutions they serve, these people represent the rule of law, the triumph of duty, the presence of God.” – Michael Gerson, Washington Post, February 12, 2018.

Does legitimacy grant esteem and prestige or does prestige and esteem grant legitimacy?

- True & False: Humans prefer True to False. I think this is because knowing what is true is (considered) more useful than knowing what is false. For example, I have a color. What is it? There are probably sixteen million false answers, many of them will be closer to true than others, but there will be only one true answer (in RGB hexadecimal-whatever terms). And the true answer is what we want and if we know what is true, we can say with certainty what is false (anything that is not true), whereas, it seems that false answers don’t often get us much closer to what is true (*ut supra*): Each false answer eliminates only half of the 15,999,999 false answers, the one true answer eliminates all of the false answers and there seems to be something metaphysical, sublime about that. Thus, when writing statements that

must be false in order for the Conflict Check to pass, careful wording is required, and a wider range of possible conditions exist that may allow the Conflict Check to pass.

- ✓ Human students may also prefer true/false answer tests, because it seems they have a 50% chance of guessing correctly if they don't know. Conflict Checks are not, however, a school test question, rather, they are a certain set of objective game conditions that a position wishes to maintain in order to keep the Government Title legitimate (and thus functioning to gain Power Activations, Acts and Scenes).<sup>12</sup>
- Carte Blanche: Conflict Checks for each Government Title are never-ending; theoretically, at all times, at any moment, the legitimacy of the Government Title is being tested. Theoretically, a Government Title loses *some* legitimacy at the moment that it is discovered that the Government Title has failed one or more of the listed Conflict Checks. This may be important in some matters and not in others, the Concierge will judge on a case-by-case basis how to deal with the instant effects of failure of specific individual Conflict Checks by a Government Title, probably including a chance to generate an Intervention Potential.
  - ✓ As a practical matter, the Concierge will perform the Conflict Checks for each of the position's Government Titles at the end of processing each position's Regular Turn.
  - ✓ As mentioned in *The Power to Choose, 5 Beginnings*, p. 50, *supra*, Conflict Checks will not be performed until the fourth turn of the game (a playability concession).

The honeymoon is over! Off with the King's head! Send in the next guy.

The conflict checks for Estate Titles can be somewhat difficult to grasp properly because they are required to be false. For interpretation purposes, a multi-part Estate Title Conflict Check that is partially true is not completely false (it is partially false), and completely false is what is required to pass the Conflict Check of an Estate Title. When a Conflict Check contains "*or*" the statement is not false if either part is true. When a Conflict Check contains "*and*" both parts must be true, or the statement is completely false. "Or/either" is a divisive, separating term, whereas, "and/both" are inclusive, cumulative.

- ✓ The Japanese claimed in the early part of their aggressions that they were protecting Asia against the Europeans; later that they were creating a Greater East Asia Co-Prosperity Sphere (a hollow propaganda conference was held in 1943 in Tokyo). Japan's actions in occupied territories soon made it all into a lie. The idea never gained legitimacy outside of the Japanese imperial government and was corrupted by Japan's military and nationalist agendas.
 

East Asia would only be trading one master or tyrant for another. Dr. Ba Maw theorizes that had Japan acted differently toward the Greater East Asia Co-Prosperity Sphere, "No military defeat could then have robbed her of the trust and gratitude of half of Asia or even more, and that would have mattered a great deal in finding for her a new, great, and abiding place in a postwar world in which Asia was coming into her own." (cited in Wikipedia article from Lebra, Joyce C. (1975). *Japan's Greater East Asia Co-Prosperity Sphere in World War II: Selected Readings and Documents*, p. 157). In short, Japan never acted in a way consistent with their outwardly expressed ideals, and thus the ideals never had legitimacy (e.g., *Mens rea & Actus reus*).
- Foreclosure of a Dream: "Yet Mr. Xi has consolidated power, sidelining or eliminating rivals, so there are few people left to blame when something goes wrong. 'Politically, I think

he is discovering that having total dictatorial power has a downside, which is that when things go wrong or have a high risk of going wrong, then you also have to bear all the responsibility,' said Victor Shih, an associate professor at the University of California San Diego who studies Chinese politics." – Chris Buckley and Steven Lee Myers, "Where's Xi? China's Leader Commands Coronavirus Fight From Safe Heights," *The New York Times*, February 8, 2020.<sup>13</sup> See similar discussion in *The Fog of Lützen*, 4 Colleges, p. 510, *supra*.

Any Social or Estate Government Title that is *currently failing all* Conflict Checks listed on its Magna Carta, is disrupted and *is removed* from the Public Space (past failures are irrelevant, only current status is checked). All Pathways leading to that Government Title are also removed and new Pathways must immediately be formed (even if objects on the Public Space need to be moved around, and some losses may occur) to connect all colonies to an undisrupted Social or Estate Title pursuant to the rules of that position's Structural Title.

- ✓ As noted in *Interesting Times*, 2 Disruption, p. 272, *supra*, the chance that a Constructural Element will become inactive due to a Disruption Event at a colony is 5% greater if the position has any disrupted Government Titles. Disrupted Government Titles can 'snowball' into an avalanche, collapsing the position.
- ✓ "Failure of the Taxation Power activation at any colony does not count as a Power Activation failure for Government Title Conflict Checks ... unless all eligible sovereign colonies fail Taxation (this could be really bad if you only have one colony...)." See *Tax Revolt and Revolting Taxes*, 1 Taxation & Census, p. 297.

When a disrupted Social or Estate Government Title is removed from the Public Space that Government Title has completely lost legitimacy and *ceases to function*. It does not provide Power Activations or Acts/Scenes (see *Exercise in Vital Powers*, 2 The Sidereal Stage, p. 114, and *On the Soapbox*, 3 The Sidereal Stage, p. 122, *supra*). It is now just a theory or history ripple and has no effect, except that an Intervention Potential Plus is automatically generated per Regular Turn for each instance of disruption of a Government Title (of any kind), see *Changing of the Gardener*, 2 Disruption, p. 271, *supra*.

- ✓ With five Government Titles (one of which is a Structural Title that does not have a Magna Carta, *ut infra*), a position could have up to sixteen Conflict Checks to navigate each Regular Turn, and *some Titles may have only one Conflict Check and be easily disrupted*. Among the Conflict Checks, some may be contradictory or at least, seem irreconcilable; thus it is expected that on any Regular Turn, several Conflict Checks may fail. In addition to passing Conflict Checks each Regular Turn, there is the rest of the game, the strategy, the events on the ground.<sup>14</sup> Some Titles may be good for some situations but are not good for the long term and will eventually fail or need to be replaced.
  - In the time when I worked on NASD/FINRA cases daily, and became increasingly aware of financial industry misconduct, it seemed that if there was a major U.S. headline financial scandal – except HealthSouth – Bear Stearns was somehow involved, e.g., Bear Stearns promoted Worldcom securities while their analyst had doubts,<sup>15</sup> praised Enron nine months before its collapse,<sup>16</sup> ending with Bear Stearns' famous collapse during the subprime mortgage crisis of 2008.<sup>17</sup> I wondered sometime in 2006, how many scandals, how much *reputational damage*, can a firm survive?

Though my impression may be inexact, it seemed that Bear Stearns was involved in a major scandal every couple of years. Thus, when Bear Stearns finally imploded in 2008 and was annexed by JP Morgan Chase (with some U.S. Government arm twisting), I thought ironically, ‘Well, it couldn’t have happened to a nicer, more upstanding firm’ (echoing Dirty Harry in *Magnum Force* (1973)).

Though the failure of Conflict Checks may or may not be scandalous,<sup>18</sup> the loss of legitimacy by Bear Stearns and final collapse is a parallel to the disruption of a Social or Estate Title.

- ✓ A sunny April 2<sup>nd</sup> morning, Bee Gee, a smallish white yearling tomcat being pursued by a large gray tomcat ran down the walk, turned the corner into my yard, giving him the slip through the hedges. The gray tomcat in pursuit ran past, then doubled back and sat on the other side of the fence staring at Bee Gee. My oldest large tomcat wandered into the yard, *touched noses with Bee Gee*, then sat down staring at the gray tomcat who shortly wandered off. King Tom I of my yard! Tribal. Sovereignty!

---

*“The earth starts to rumble  
World powers fall  
A’warring for the heavens  
A peaceful man stands tall  
Tall, tall.”*

– Megadeth, “Symphony of Destruction” (1992)

---

**World Powers Fall:** There are three conditions under which a *Structural Government Title* can become disrupted (but **does not** generate an IP+): A Structural Title is disrupted:

- ✓ If the position does not currently have a Capital Colony (**after** a position’s Capital Colony has been established, see Capital Colony, 2 Order, p. 532, *supra*),
- ✓ If the position has no remaining undisrupted Social or Estate Titles, or
- ✓ If the position is unable to comply with the requirements of the Structural Title for any reason, including but not limited to, having no undisrupted Social or Estate Titles to connect the colonies by Pathways or being unable to place Titles in required ways.

As *Structural Titles* do not occupy any Monads on the Public Space (except Pathways), there is nothing to remove when a Structural Title becomes disrupted. Rather, the disrupted Structural Title continues to exist in Pathways on the Public Space, but does not collect Acts or Scenes and is not able to provide a Power Activation while disrupted. While disrupted, the placement requirements of the Structural Title continue to apply on the Public Space, until and unless it is replaced by a new Structural Title. A Structural Title becomes undisrupted or restored at the end of any turn when there are no remaining conditions which would cause it to be disrupted.

- ✓ This *automatic restoration* applies only to Structural Titles; restoration of Social and Estate Titles requires an activation of the Order Power and is discussed later.
- ✓ Note that as Structural Titles have no Conflict Checks they are generally less susceptible to the vagaries of game events and decisions. Structural Titles are sort of the

bedrock or spine of the position’s government, and usually always insure a minimum of one Power Activation available each Regular Turn.

*“Romantic nationalism (also national romanticism, organic nationalism, identity nationalism) is the form of nationalism in which the state derives its political legitimacy as an organic consequence of the unity of those it governs. This includes, depending on the particular manner of practice, the language, race, culture, religion, and customs of the nation in its primal sense of those who were born within its culture. This form of nationalism arose in reaction to dynastic or imperial hegemony, which assessed the legitimacy of the state from the top down, emanating from a monarch or other authority, which justified its existence. Such downward-radiating power might ultimately derive from a god or gods (see the divine right of kings and the Mandate of Heaven).”*

– from Wikipedia article, “Romantic nationalism,” captured November 28, 2018 (emphasis added)

**Romantic Nationalism:** As I am a product of the 20<sup>th</sup> Century and the participants are of the 20<sup>th</sup> or 21<sup>st</sup> Century, there is little doubt that GGDM was designed and will be played from the view of romantic nationalism (defined, *ut supra*). Certainly the Conflict Checks discussed above, reflect romantic nationalism, but whether this is appropriate for an interstellar government with isolated colony worlds separated by vast distances is very questionable.

Notably, much of space-opera and interstellar-set science-fiction features heavy-handed imperial, dictatorial, or top-down legitimacy (“dynastic or imperial hegemony,” *ut supra*), the agents of which are the starship captains and crews, see *Nobless Oblige* discussion, 4 Movement, p. 869, *infra*; also Status Quo, *ut supra*. See also discussion of ethnic and ultra-nationalism in Hege-  
monic Empires and Invading Timelines, 4 Order, pp. 571, 576, respectively, *supra*.

- ✓ “...in the mid-nineteenth century, it was common to believe in collective spirits embodied in ‘the nation’ or, under Hegelian and Marxist influence, in other collectivities such as ‘the bourgeoisie’ or ‘the proletariat.’” – Michael Accad, M.D., “An introduction to praxeology and Austrian school economics,” alertandoriented.com (blog), April 13, 2016.
- ✓ “National mysticism (German *Nationalmystik*) is a form of nationalism which raises the nation to the status of numen or divinity. Its best known instance is Germanic mysticism, which gave rise to occultism under the ‘Third Reich.’ The idea of the nation as a divine entity was presented by Johann Gottlieb Fichte. National mysticism is closely related to Romantic nationalism, but goes beyond the expounding of romantic sentiment, to a mystical veneration of the nation as a transcendent truth. It often intersects with ethnic nationalism by pseudohistorical assertions about the origins of a given ethnicity. National mysticism is encountered in many nationalisms other than Germanic or Nazi mysticism, and expresses itself in the use of occult, pseudoscientific, or pseudohistorical beliefs to back up nationalistic claims, often involving unrealistic notions of the antiquity of a nation (antiquity frenzy) or any national myth defended as ‘true’ by pseudo-scholarly means.” – from Wikipedia article, “National mysticism,” captured November 28, 2018.

- “Ancient History Encyclopedia was founded in 2009 by Jan van der Crabben. He realized that the internet was missing a reliable and comprehensive resource for ancient history. What was available online was either scattered across various websites, illegible due to poor presentations or tainted with a distinct nationalist agenda.” – from About page, Ancient History Encyclopedia, August 30, 2019.

A possible early example of a national mysticism is the Novgorod Republic (1136-1478), ruled by a council (after expelling the Grand Prince of Kiev) who invited various Rus’ princes to rule at times when they needed military assistance and command. However, sovereignty always remained with the council, and *the city* (not the Prince) was referred to as “His Majesty Lord Novgorod the Great” indicating personification, gender, and possible mystical transcendent meaning assigned to the state.

- ✓ Information from Wikipedia article, “Novgorod Republic,” captured December 7, 2018.
- ✓ See also, *romantic narcissism*, Hand-Wringing Aspect, 3 Colleges, p. 487, *supra*.

---

*“Nietzscheans used to say we act out of enlightened self-interest. The problem with Bolivar and his ilk is that they’ve forgotten the most important word: Enlightened.”*

\*\*\*

*“Our people were meant to be living gods, warrior-poets who roamed the stars bringing civilization, not cowards and bullies who prey on the weak and kill each other for sport. I never imagined they’d prove themselves so inferior. I didn’t betray our people – they betrayed themselves.”*

– Telemachus Rhade, Andromeda, “The Unconquerable Man” (2003) <sup>19</sup>

---

*“The reality of the conflicts between the Europeans and Xhosa involves a balance of tension. At times, tensions existed between the various Europeans in the Cape region, tensions between Empire administration and colonial governments, and tensions within the Xhosa Kingdom e.g., chiefs rivalling each other which usually led to Europeans taking advantage of that and meddle [sic] in the Xhosa kingdom politics. A perfect example of this is the case of chief Ngqika and his uncle chief Ndlambe.”* – from Wikipedia article, “Xhosa Wars,” June 15, 2019

---

**Between Nietzscheans & Xhosa:** The Nietzscheans in the Andromeda television series (2000-2005) were predatory (like the colonial British), the Xhosa in real-world history were victims.

- ✓ There was considerable jostling going on; the Xhosa chiefs fought each other (e.g., the Battle of Amalinde in 1818) and were under pressure from other expanding or displaced South African tribes.
- ✓ The classic answer is that there must be a higher power to keep all smaller units in order, and that was, of course, the European colonial power, Britain.
  - “So this is not a situation where two states each mistakenly worry that the other is hostile. Rather, it’s what international relations scholars might call a classic problem of anarchy, in the sense *that there is no power above states that can enforce agreements they make with each other.*” – James D.

Fearon, “The Big Problem with North Korea isn’t that we can’t trust them. It’s that they can’t trust us,” Washington Post, August 16, 2017.

This classic answer is the basis of science-fiction’s galactic or interstellar empire trope (or in Star Trek, the Federation, an ‘Americanized’ form of interstellar empire). See also Hegemony discussion, 4 Order, p. 570, *supra*.

- ✓ After the Battle of Amalinde, fueled by opposing Xhosa chiefs and millennialist seers, the British intervened, destroyed one of the chiefs and settlers invaded and colonized large tracts of fertile lands which were never recovered to the Xhosa.<sup>20</sup> The loser of the civil conflict was the Xhosa Kingdom which vanished in three generations.

Page | 620

---

**Vir Cotto:** *“Politics and morality on the same side? That doesn’t happen every day, Deleenn.”* – Babylon 5, “Between the Darkness and the Light” (1997)

---

**And the Parting on the Left, Is Now a Parting on the Right:** Governments exist because of needs, conditions and circumstances. Morality and the common good only become part of the government when their absence is intolerable.

- ✓ When a bad, oppressive government survives, it is not solely because of the leader (who usually receives all of the blame), but because that leader had plenty of other people helping him mislead, oppress, rob, and murder his own or other people.<sup>21</sup> Thus, bad regimes are a result not of the leader who is blamed, but the state of the civilization, the ideals of the people, from whom it rose to absolute power.

The Conflict Checks necessarily focus on needs, conditions, and circumstances that brought about the Title, and how that Title maintains legitimacy. Good and morality are optional.

- ✓ For example, the primary question asked with regard to Estate Titles is “what condition or circumstances must have existed in order for this group to become a ruling Estate, what needs do they serve, and what conditions or circumstances must continue in order for the Estate to continue ruling?”
- ✓ Whereas Social Titles represent the ideals and prevailing beliefs of the civilization, and therefore, the question asked is, “what ideals or concepts prevail in this society to which standards the government will be held in the test of legitimacy, and what sorts of conditions and circumstances would ideally represent the beliefs of the people?”

As a practical matter, however, when looking at the Conflict Checks for various Estate and Social Titles, there may appear to be no major differences between the two or between the way that they play in the game (that is, the differences between Estate and Social Titles are ‘a little fuzzy’), and many may regard the designation of “Estate” and “Social” as window-dressing. Indeed, there is no special game mechanic for either one anywhere in the rules, however, beyond the rules, the Concierge will frequently take into consideration the position’s current Social and Estate Titles (the current sociopolitical milieu), as representative of the position, when deciding other matters, or applying Interventions, and the conditions imposed by the Conflict Checks do serve to guide the position’s activities and conduct (in the form of negative stimuli/negativity bias), gives the position a personality.

- ✓ Government Titles should not be viewed as any sort of *advantage* in the game, they do not grant any special ability (their game function is Power Activation and Acts and Scenes), rather, their effect is to guide the position's conduct and development by the conditions required to maintain their legitimacy.

**OV-VO Schemes:** Many years ago I wondered, what is the cognitive difference between:

- 1) Native speakers of languages where the *object comes first in the sentence* (i.e., the OV – object-verb languages, that is, SOV – subject, object, verb, [e.g., “Charles cereal ate”]) and OSV, OVS languages, e.g. Latin, Japanese, Korean and about half the languages in the world), and
- 2) Native speakers of languages where the *verb generally occurs first in the sentence* (i.e., the VO – verb-object languages, specifically SVO – subject-verb-object languages [e.g., “Charles ate cereal”]) VSO, VOS languages, e.g., English, Russian, Cantonese and about half the languages in the world)?

Does the word order of the language make one group of speakers more “object/noun oriented” and the other group of speakers more “verb/action/tense” oriented? And what, if anything, does that indicate about their cognitive processes and worldview? In case you are wondering, I don't have any great answers to these questions (or even a clue) and I doubt that it has been the subject of much research or literature. I have little idea of how it might be testable.

If you are having difficulty learning a foreign language, part of the problem may be a switch from VO to OV order (e.g., an English speaker learning Japanese or Korean), which demonstrates that there is a real natural, learned cognitive divide caused by the common preferred word order of the speaker's native language. In intro linguistics class, I even found the concepts of declination and masculine, neuter and feminine verbs (e.g., in Latin) difficult to *grok*.<sup>22</sup>

- 3) Another Angle: Justin, the narrator for *Fire of Learning* (<https://www.pat-reon.com/FireofLearning>), noted in the YouTube video “How Latin Works” that Latin derives meaning from word endings (i.e. noun endings are changed by location in sentence, but do not change meaning – I think this is the declination problem I couldn't grasp) and not word order (he suggests that Russian may be somewhat similar) and thus any word order is grammatically correct in Latin if the correct word endings are used. This is obviously much different than modern languages. He does go on to say, however, that the Romans preferred subject-object-verb order (like English) and that memorizing all of the word endings-placements in Latin is tedious. The first millennial shift from changing word endings to word ordering to create meaning is curious, it is difficult to discern what it means, if anything, cognitively.

The problem of distinguishing clearly between Estate and Social Titles feels similar to the OV-VO language cognitive schema discussion, but one more accessible and resolvable (i.e., cognizable), perhaps because it is outside us, or perhaps because I have developed mental tools for it.

---

*“If any one basic cause could be assigned to Europe's first great conflict since Waterloo, it might have been found in the consent of the various peoples. For half a century they had given their rulers full powers in the secret dealings of diplomacy and strategy, and during the summer of 1914 the blank check was presented for payment.”*

– Lynn Montross, *War Through the Ages* (3<sup>rd</sup> Ed., 1960), p. 683

---

## Endnotes.

<sup>1</sup> Commentary: Fascist Italy was like the kid who goes along with what the neighborhood bully is doing, then after things go bad, wants out, but finds out then that it is too late. The bully and his gang occupy the kid's apartment, antagonize the neighbors and ☹ the place until the police arrive.

<sup>2</sup> Commentary: I specifically remember the Iran Hostage Situation, Skylab and Abscam from 1979; I don't have any memory of the Grand Mosque Seizure. I turned 12 in 1979, it is likely that I remember the first three because they had to do with the United States, i.e. they were closer to home. It is also likely, for the very same reason, that the first three dominated the half-hour network evening news in a time when we still had 13 channels on the dial. Thus, the Grand Mosque standoff may not have received much air time in the United States.

<sup>3</sup> Citation: Merriam-Webster's 11<sup>th</sup> Collegiate Dictionary.

<sup>4</sup> Commentary: Did you ever notice that the Spanish, French, Native Americans (all major landholders in North America), and slaves were not invited to the *Continental Congress*? How continental was it? A group of white men from part of the east coast of North America. Nor did they deign to call themselves the Colonial Congress instead.

<sup>5</sup> Citation: "When he said in 2012 that the Constitution was 'either inspired by God or written by brilliant people, or perhaps a combination of both,' Romney was echoing Mormon teaching. The Church of Jesus Christ of Latter-day Saints (LDS) has a deep and doctrinal devotion to the U.S. Constitution, which it considers to be divinely inspired.

The first rumors of a possible 'Senator Romney,' which began to swirl in April 2017, brought new life to the long-whispered 'White Horse Prophecy' that combines this messianic constitutionalism with Mormon politics. Depending on whom you ask, the White Horse Prophecy holds either that Mormons will one day save the American constitutional system in its darkest hour, or that Mormons will overthrow American democracy to create a latter-day theocracy. The prophecy is attributed to Mormonism's founder, Joseph Smith Jr. In 1843, Smith purportedly told his followers that on the day when 'the Constitution of the United States is almost destroyed... hang[ing] like a thread,' out of the 'Rocky Mountains' the 'great and mighty' Mormon people will, like the 'White Horse' of the Book of Revelation, rush east to save the Constitution.

While the White Horse Prophecy itself is almost certainly apocryphal, Mormon leaders in the nineteenth century consistently taught, as Joseph Smith's successor Brigham Young did in 1868, 'if the Constitution of the United States is to be saved at all it must be done by this [Mormon] people.' Likewise, in the twentieth century, LDS Church leaders as well as Mormon politicians continued to invoke the spirit of the prophecy, if not the prophecy itself. During his own presidential run, in 1967, George Romney explained that what Smith, Young, and other early LDS Church leaders meant in their prophecies about the Mormons' special role in American political history: 'Sometime the question of whether we are going to proceed on the basis of the Constitution would arise and at this point government leaders who were Mormons would be involved in answering that question.' Forty years later, as Mitt Romney positioned himself for a White House bid in 2007, he denied that the prophecy had anything to do with his own political aspirations or religious beliefs.

Romney's forceful denunciation came in response to the virulent anti-Mormonism that helped derail his first presidential bid. After all, the negative attention Romney's campaign generated for the church, the LDS Church officially repudiated the prophecy in 2010. Mormon scholars downplay the prophecy as 'no more than a fun bit of Mormon folklore,' as political scientist Russell Arben Fox put it to me. But like all folklore it reveals something about the culture from which it emerges. And for that reason, 'the prophecy has long functioned as a kind of metaphor,' Fox said, 'helping to organize Mormon aspirations and ambitions for political service.'" – Max Perry Mueller, "Mitt Romney's Mormon Mission," *Slate*, February 20, 2018.

<sup>6</sup> Commentary & Citation: In 1459 Diether of Isenburg won election as Archbishop of Mainz. Although elected, the Archbishop was effectively a ruler-prince of the territory, controlling its foreign policy, military forces, taxation, law and order, etc. He lost a war against the Count Palatine the next year. After being elected, he had to pay 20,000 guilders to secure confirmation from the Pope, then the Pope sacked him two years later in 1461 for attempting to introduce reforms and for opposition to the Papacy and Holy Roman Emperor. Hmm... 1461 was five years before Erasmus was born, and 22 years before Martin Luther was born in Eisleben about 375 km (233 mi) northwest of Mainz, and 21 years after Gutenberg invented the mechanical movable type printing press in Strasbourg (his family left Mainz for political reasons 50 years earlier following a craftsmen revolt).

So the Pope took his money, then sacked him and installed his rival, Adolf of Nassau as Archbishop of Mainz. The people of Mainz however supported Diether and he refused to leave. With a conflict brewing, everyone else jumped in – bishops, archbishops, counts, and princes – all secular rulers of territories – and took sides. Towns, land, castles

and gold were ceded or exchanged to secure alliances. There was a big war called the Baden-Palatine War, the Baden allies sacked and burned towns on both sides of the Rhine River on the way to invading the Palatinate, until they were ambushed and defeated in a forest by the Prince of Palatine's forces after being deceived as to the location of enemy forces. The Prince of Palatine took high-level prisoners, held them as hostages in his castle until their huge ransoms were paid, and this ended the war between Baden and Palatine.

But not between the competing Archbishops of Mainz. Eventually, Adolf of Nassau snuck into Mainz with 500 men and captured the town, Mainz was plundered and damaged, outlying settlements were burned and plundered. Deither was deposed by force and expelled with about a hundred families from Mainz. One of those expelled from Mainz in 1462 was the elderly Johannes Gutenberg, who returned in 1465, died in 1468 and was buried in Mainz. Information from Wikipedia articles, "Johannes Gutenberg," and "Mainz Diocesan Feud."

<sup>7</sup> Citation: Earlier in the movie at their first – unfortunate – meeting, Lawrence had said to Ali: "Sherif Ali. So long as the Arabs fight tribe against tribe, so long will they be a little people; a silly people; greedy, barbarous, and cruel, as you are." *Id.*

<sup>8</sup> Commentary & Citation: Perhaps the concept of negative and positive sovereignty might be useful in GGDM:

- ✓ "As Jackson argued, negative sovereignty is focused on sovereigns, whereas positive sovereignty is more responsive to those who are subject to sovereign power." – Miriam Ronzoni, "Two Conceptions of State Sovereignty, and Their Implications for Global Institutional Design," <https://ecpr.eu/Filestore/PaperProposal/4ecd5722-de86-403f-ada9-a89c675765b7.pdf> (European Consortium for Political Research).

Justice Jackson is the foremost modern American judicial authority on sovereignty, his most famous book being about "quasi-states."

- ✓ "A controversial thesis underlies this theoretical book: much of the Third World consists of 'quasi-states' that exist because of their formal acceptance by the international community rather than their post-colonial attributes. These countries, it is asserted, are unable to protect human rights or provide social benefits and economic welfare. Thus they have 'negative' rather than 'positive' sovereignty." – Andrew J. Pierre, reviewing Justice Jackson's Quasi-States: Sovereignty, International Relations And The Third World, Foreign Affairs, Is. 22, Winter 1991.

<sup>9</sup> Commentary & Citation: The French had a long history in Syria ending finally in 1946, when the British invaded Syria to end spiraling-out-of-control protests and violent responses between the Syrians and French troops.

- ✓ "[T.E.] Lawrence had a sinister reputation in France, both during his lifetime and even today, being seen as an implacable 'enemy of France'; the man who was supposedly constantly stirring up the Syrians to revolt against French rule throughout the 1920s. The French historian Maurice Larès wrote that the real reason for France's problems in Syria was that the Syrians did not want to be ruled by France, and the French needed a 'scapegoat' to blame for their difficulties in ruling the country. Larès wrote that far from being a Francophobe, as he is usually depicted in France, Lawrence was really a Francophile. Larès wrote: 'But we should note that a man rarely devotes much of his time and effort to the study of a language and of the literature of a people he hates, unless this is in order to work for its destruction (Eichmann's behavior may be an instance of this), which was clearly not Lawrence's case. Had Lawrence really disliked the French, would he, even for financial reasons, have translated French novels into English? The quality of his translation of *Le Gigantesque* (The Forest Giant) reveals not only his conscientiousness as an artist but also a knowledge of French that can scarcely have derived from unfriendly feelings.' Larès concluded that the popular thesis in France that Lawrence had 'virulent anti-French prejudices' is not supported by the facts." – from Wikipedia article, "T.E. Lawrence," January 10, 2019, referencing Maurice Larès "T.E. Lawrence and France: Friends or Foes?" (1984). T.E. Lawrence is also commonly known as "Lawrence of Arabia."

<sup>10</sup> Commentary: You could 'read into' this scene that he is suggesting that humans are not entitled to the truth and thus it is hidden from them (by God). I trip over the word 'entitled' because it probably doesn't apply and I am not sure what it means in that context. Dietrich Bonhoeffer, by implication of his profession, believes that truth is completely objective in the form of God. But in the most literal sense, he is talking about the Nazis and specifically, about is interrogator, Manfred Roeder ("He's got no right to the truth" *Id.*); earlier in the film Bonhoeffer had preached that Adolf Hitler was trying to put himself in the place of Jesus Christ in demanding unquestioning obedience (e.g., the Nazi oath of allegiance to Hitler) to which he is not entitled even as the elected leader of Germany.

<sup>11</sup> Citation & Commentary: "Daniela described how she went from being a bright and promising high school student in Mexico with dreams of becoming a scientist to being pulled into the self-help curriculum of Nxivm, and eventually kept in isolation in a room for nearly two years at the direction of members of the cult-like group. 'Was

the door locked?’ prosecutor Moira Penza asked. ‘No,’ Daniela testified. ‘Did you feel like you could leave the room?’ Penza asked. ‘No.’ Daniela testified that Raniere and other Nxivm members convinced her own family that she had done something horrible enough to warrant being held in a room in isolation, and that they enlisted her family’s help to keep her there. She went years without seeing her family. ...

Daniela testified that Raniere and other Nxivm members enlisted the help of her own family to ‘work on her.’ They were told, ‘Your daughter is prideful and destructive.’ Her family didn’t know that the basis of Daniela’s ‘ethical breach’ was that she had developed feelings for another man. Instead, Raniere told her family about an incident years earlier in which she had stolen and promptly returned money. Raniere encouraged her family to be strict with Daniela. ... Every waking hour of her life was focused on how to repair her so-called ethical breach, Daniela testified. She said her parents and high-ranking members told her the only way to fix things would be to stay in isolation in a room in her family’s home indefinitely.” – Sonia Moghe, “‘Please let me out’: Former Nxivm member testifies about being held in a room for 2 years,” CNN, June 2, 2019.

- ✓ Think that humans have nothing in common with fleas? Authority is the legitimacy to put the lid on the dish. The real question to ask in the Nxivm case is why or how Raniere and his little group obtained legitimacy of authority over the ‘victims’ of the scam? Daniela’s door was not locked, but our prisons are locked and guarded at public expense to keep the criminals inside and the public outside. Disturbing?

<sup>12</sup> Commentary: Sometimes I wonder if I am ‘doing it right’? But what does that mean in the design of GGDM (or life even)? Does it mean I did it wrong because while GGDM is a game, it is likely never to be played? Did I do it wrong if it is deemed likely that few will ever read GGDM or give a damn about it? Did I do my life ‘wrong’ by being obsessed with GGDM? What would constitute ‘doing it wrong’ – or in this case, what would be a ‘false’ answer if ‘doing it right’ is the only ‘true’ answer? I can’t know if I am doing it right if I don’t know within what framework or objective it is to be measured. And thus, I do what seems right each time and the game evolves, emerges and slowly drifts toward some unknown destination. The goal post has been moved left and right and down the field many times since 1992. I continue to “comb and curl” my dialogues (Dionysius of Halicarnassus). I have read interviews and commentary by fiction writers who claim that when they begin a story, they don’t know where it will go and they are sometimes ‘surprised’ by what the characters do in the story and how it ends; that is, whether they are ‘doing it right’ or not is unknown until the work is finished. This has sometimes happened in GGDM too.

<sup>13</sup> Citation: “‘It’s a big shock to the legitimacy of the ruling party. I think it could be only second to the June 4 incident of 1989. It’s that big,’ said Rong Jian, a writer about politics in Beijing, referring to the armed crackdown on Tiananmen Square protesters that year. ‘There’s no doubt about his control over power,’ he added, ‘but the manner of control and its consequences have hurt his legitimacy and reputation.’ Mr. Xi himself has recognized what is at stake, calling the outbreak ‘a major test of China’s system and capacity for governance.’” – Chris Buckley and Steven Lee Myers, “Where’s Xi? China’s Leader Commands Coronavirus Fight From Safe Heights,” The New York Times, February 8, 2020.

- ✓ In a late March 2020 CNN interview with Jake Tapper, the head of the CDC suggested that the Chinese government may (intentionally) not be accurately reporting deaths from the coronavirus outbreak in China.

<sup>14</sup> Commentary: When I was about 9 years old, I was at a family get-together at a remote trailer. I decided to climb a huge evergreen tree on a hilltop. I got up into the tree and kept climbing up, wending my way around close branches and needles, as only a 9-years-old boy can. I was apparently quite determined, and having fun, and didn’t give much thought about how far up I was in the tree (some people would say I am still far up the tree) or all the bumps and scrapes I was receiving. Suddenly, I emerged at the top of the tree – literally the top of the tree – looking around at the tops of the other trees below me, and the wind started blowing. I was holding onto the swaying tree top for dear life! I hadn’t anticipated it. Legitimacy in GGDM Social and Estate Government Titles feels this way; in addition to the position’s own actions or inactions, actions of other positions (sometimes seemingly innocuous) and adverse News Events effects, and even some luck of die rolls, buffet against Conflict Checks each turn.

<sup>15</sup> Commentary & Citation: Laurence Vile Davidson (Bloomberg News), “Bear Stearns Analysts Had WorldCom Doubts,” Washington Post, November 3, 2004.

<sup>16</sup> Commentary & Citation: Bear Stearns was sued by Enron, settled with the Enron Creditors Group, a 2001 analyst memo from Bear Stearns praising Enron nine months before it collapsed was posted to Wall Street Oasis in October 2015 (Mike Bird, “A hilarious 2001 Wall Street research note praised Enron’s ‘revolutionary’ business model 9 months before it started to collapse,” Business Insider, October 26, 2015; Sloane Ortel, “Enron Revisited: Highlights from Bear Stearns Research,” <https://blogs.cfainstitute.org/investor/2015/10/28/enron-revisited-highlights-from-bear-stearns-research/>, October 28, 2015).

<sup>17</sup> Citation: Matt Egan, “The stunning downfall of Bear Stearns and its bridge-playing CEO,” CNN Business, March 16, 2018, describing the hands off management style at Bear Stearns:

- ✓ “Cayne served as Bear’s CEO for 15 years. He held that title until January 2008, when he stepped down as CEO but stayed on as chairman. In the tense months around that time, Cayne’s hands-off management style led him to miss critical events that foreshadowed the meltdown. When a pair of Bear Stearns hedge funds that bet on mortgages collapsed in July 2007, Cayne was playing a bridge tournament in Nashville, Tennessee, without a cellphone or email access, The Wall Street Journal reported at the time. Despite the tremors on Wall Street that summer, Cayne typically took long weekends to play golf at a country club in New Jersey. On Thursdays, the CEO would take a \$1,700 helicopter ride from Manhattan – he paid for it himself – to squeeze in a late-afternoon golf game and then another on Friday, the Journal reported.”

<sup>18</sup> Commentary: For example, I heard at various times in my youth an assertion that the U.S. government knew in advance that the Japanese were going to attack Pearl Harbor and either acted indifferently, or more sinister, deliberately allowed it to happen. There seemed to be some circumstantial evidence. The Japanese, aware of how the attack would be perceived in America without a formal declaration of war, instructed their ambassador to deliver the declaration of war shortly before the scheduled attack time. However, the ambassador was kept waiting for an hour and a half outside the Oval Office and thus missed delivering the war declaration in advance of the attack. Thus it was perceived in America that the Japanese attack was treacherous and without reason; however, unknown to most of the public, the U.S. had previously threatened to intervene against Japan in French Indochina (i.e. Vietnam) and moved the Pacific Fleet half way across the Pacific Ocean to Pearl Harbor (which did not have underwater torpedo nets) from San Francisco (which did have) which the Japanese took as a direct threat of force by the United States.

- ✓ Note however, that in November 1914, the British and French naval forces ‘tested’ the Ottoman Empire defenses of the Dardanelles with a 20-minute bombardment before any formal declaration of war was issued against the Ottoman Empire. This ‘test’ attack alerted the Ottomans who then added mines and new defenses, brought up more ammunition; the minefields caused the Allied fleets much difficulty and lost ships on subsequent attacks in February and March 1915, leading ultimately to failure.

<sup>19</sup> Commentary: The current trend toward ‘tribalism’ in our political culture – bemoaned by many over the last five years – is the next generation of 1960s to 1980s activism that became self-interest without the enlightened part.

<sup>20</sup> Commentary: The English had long practice at this; the Normans had done essentially the same to the Welsh and Irish in the 11<sup>th</sup> and 12<sup>th</sup> Centuries.

<sup>21</sup> Commentary: This is an adjunct of functionalism historiography holocaust arguments; that whatever focus is placed on Hitler by intentionalism holocaust historians, he was but one man: Germany as a nation with the help of local auxiliaries committed the crimes, especially in Poland, the Baltic States and the Ukraine.

<sup>22</sup> Commentary: My undergrad intro linguistics course was the worst course (even compared to pre-calculus with a professor who barely spoke English). In my last semester as an undergrad, I had to take six courses to complete the requirements to graduate. I had three law courses, world literature, intro linguistics, logic, and a graveyard shift security guard job at a tourist-trap mall, plus Marine Reserves drill at Anacostia Naval Base. The world literature and intro linguistics courses were taught by professors who were husband and wife, the first of two times that happened to me. The first two weeks of the linguistics course taught the IPA (International Phonetic Alphabet) which I recognized as similar to Speedwriting Shorthand, of which I had completed three courses in secretarial school.

But after that, we began the course textbook. I told the professor that reading the linguistics textbook felt like wading through mud (i.e. reading without comprehension), and that I had three law courses and a world literature course (all with substantial reading assignments), and with limited reading time, which books do you think I will spend my time reading? The intro linguistics course was such a disaster that the professor, who barely lectured or whose lectures were barely intelligible, ended up significantly curving the grades, which was the only reason I passed. The worst aspect of it was that I had been generally interested in linguistics since the time I had switched to an Anthropology major, I was looking forward to the course (it was an elective), and I felt that I should be able to *grok* it, that it was accessible. But alas it was a big concrete wall, apparently I do not have a linguistics (or pre-calculus) mind.

*See Appendix EGTEX – Emergent Government Titles Example*  
*See Appendix GT – Emergent Government Titles*

*“THE real trouble with this world of ours is not that it is an unreasonable world, nor even that it is a reasonable one. The commonest kind of trouble is that it is nearly reasonable, but not quite. Life is not an illogicality; yet it is a trap for logicians. It looks just a little more mathematical and regular than it is; its exactitude is obvious, but its inexactitude is hidden; its wildness lies in wait.*

*I give one coarse instance of what I mean. Suppose some mathematical creature from the moon were to reckon up the human body; he would at once see that the essential thing about it was that it was duplicate. A man is two men, he on the right exactly resembling him on the left. Having noted that there was an arm on the right and one on the left, a leg on the right and one on the left, he might go further and still find on each side the same number of fingers, the same number of toes, twin eyes, twin ears, twin nostrils, and even twin lobes of the brain. At last he would take it as a law; and then, where he found a heart on one side, would deduce that there was another heart on the other. And just then, where he most felt he was right, he would be wrong.”*

– G.K. Chesterton, Orthodoxy, Ch. 6 (1908) (emphasis in original) <sup>1</sup>

**Two Hearts:** Perhaps G.K. Chesterton is the origin of Dr. Who’s two hearts – he is distinguishable from humans in that he has two hearts, both physically and metaphorically. Sometimes the viewers forget that he is actually an alien in human form, he is not one of us, it is both human and an alien time lord.

- ✓ Mr. Chesterton also, probably not coincidentally, describes exactly why the ancient Greeks and Medieval scholars were wrong about Terra Australis Incognita.

**Cockeyed Universe:** Sometimes you wonder if the universe is ‘programmed’ in some cockeyed way and we occasionally get a glimpse of it. On Wednesday, November 28, 2019 the Pittsburgh Penguins were down 3-0 to the Avalanche in Colorado. Penguins captain Sidney Crosby then scored three consecutive goals – a natural hat trick in 5:35 of game time – to tie the game, but the Penguins lost the game 6-3. On Tuesday, December 4, the Colorado Avalanche were down 3-0 to the Penguins in Pittsburgh. The Avalanche scored three quick goals in the 2<sup>nd</sup> Period to tie the game 3-3. But in the 3<sup>rd</sup> Period (after an Avalanche goal was disallowed for goaltender interference), Penguins winger Patrick Hornqvist scored three consecutive goals – a natural hat trick in 2:47 of game time and a new Penguins record on hat giveaway night – to put the Penguins up 6-3 over the Avalanche, which was the final score. Many of the free hats ended up on the ice.

- ✓ Sometimes I think my life was programmed, every human has thought this at least once. Is it that we look back on our lives in see the inevitability of our current situation in the events of the past, or is it just the human need to try to assemble meaning out of random events? It is the source of the ideas of destiny and pre-destiny, ideas which any reasonable person rejects quickly, which is supported only by the barest stretched circumstantial evidence, but to which humanity holds onto intuitively.

**Emergent Titles:** About 15 years ago, I designed a set of 100 Government Titles by the process of first thinking of a name or concept (e.g., oligarchy, matriarchy) and then matching to it up to four Conflict Checks that seemed to reflect the requirements of the concept or ideology.

This was a decently useful process in forming the idea of Government Titles; however, game designers, especially those of tabletop games, long ago discovered that combinations of randomly generated attributes are superior for encouraging emergent game narrative (not to mention the

exponential number of possible combinations from just a few attributes) because sapient beings will naturally try to make sense out of apparent randomness. While such a system may not be suitable for fuzzy concepts such as Fundamental Realities, it is eminently suitable for concrete, objective at-the-moment game situations such as are Conflict Checks in Government Titles.

- ✓ The later switch to emergent Government Titles provided a structure supporting a much more diverse, thought-provoking range of Conflict Checks, a better distinction of Social and Estate Titles, and a more realistic depiction of existential realities of governments.<sup>2</sup> Much of the commentary and various discussion points in the GGDM text are reflected in the Themes.
  - ✓ There are 600 Conflict Checks in 60 Title Themes. Each Government Title will use at most 4 Conflict Checks and each position will have a maximum of 16 Conflict Checks to satisfy. The Themes and Conflict Checks cover all subjects important to the game that can be expressed in objective game data.
- Shaking the Bingo Balls: Construction of an emergent Government Title is accomplished in the following steps (a decision tree which easily can be automated):
1. It must first be decided whether the proposed title is a Social Title or Estate Title. This can be done by a 50-50 die roll, or it can be a conscious decision.
  2. Next must be determined the ‘scope of the concept’ in GGDM terms, a die is rolled to determine if the Government Title has 1, 2, 3, or 4 Conflict Checks.
    - During the 2016 Presidential Election, there was more than the usual talk about the rise of a third major party to break the monopoly and declining effectiveness of the two-party system instituted in 1858. I read an article (which I cannot find now, so I will paraphrase) written by a journalist who attended a fringe political party national convention where they nominated their 2016 Presidential candidate. The journalist noted that the convention was held in a hotel at the same time as a large comic book convention, and people from the latter wandered in and out of the political convention. He also vaguely mocked the list of fringe speakers at the convention and lamented the range of small, one-issue, limited appeal political parties. His suggestion in the end was that if one of these parties could get serious (and serious donors) and ‘get rid of their tin-foil hat,’ they might attract enough support to become a major party in the current climate. The two major parties, of course, have broad appeal and platforms covering all major issues. Thus, the number of Conflict Checks can vaguely equate to the major issues represented by the Government Title.
  3. The third step is to determine whether one of the Conflict Checks will come from the Interstellar Civilization Themes instead of either the Social or Estate Title Themes. This can be done on a 50-50 die roll as well. If the result is positive, one of the Social or Estate Title Theme Conflict Checks is replaced by using a randomly-determined Theme from the Interstellar Civilization Group to generate that Conflict Check. This is done even if the proposed Title has only one Conflict Check; that is, a single Conflict Check Social or Estate Title can arise from Interstellar Civilization Themes, and still act as either a Social or Estate Title in the game.

4. The forth step then is to make two rolls for each Conflict Check, one to determine which Emergent Government Titles Theme is to be used (#1-20), and the second roll is to determine which Conflict Check is selected from the Theme (#1-10). Do not re-roll duplicates of the first die roll (i.e. two Conflict Checks can come from the same Theme), but do reroll duplicates on the second roll (i.e. a Government Title should not have exact duplicate Conflict Checks). Conflict Checks can be contradictory.
5. After determining the Conflict Checks, the final step to creating an Emergent Government Title is to first roll a die to determine how many Vital Powers are associated with the Government Title and then to roll to determine which Vital Powers are associated with the Title, rerolling all duplicates.

For example, a new *Estate Title* is being generated, the die roll result indicates that it will have four Conflict Checks (Steps 1 and 2).

- A die is rolled and on an even result it is determined that one of the four Conflict Checks will be rolled from the Interstellar Civilization Themes (Step 3). So let's get to it! One d20 is rolled and the result is a 15 which is the Security and Survival Theme (i.e. ICT15). A d10 is rolled in that theme group and the result is a 1: "(T) No other **alien colonies** exist in systems where a Friendly Colony is located *or* all **alien colonies** in a starsystem with a Friendly Colony are owned by the position." This is the first Conflict Check for the new Estate Title. Hmm...
- A d20 is then rolled three times for the Conflict Checks from the Estate Themes (Step 4), with results of 1, 1, and 9, meaning that two Conflict Checks will come from EGT1 – First Estate – Legitimizers and one from EGT9 - Military-Industrial Complex of the Estate Title Themes.
- On EGT1, two d10 are rolled resulting in Conflict Checks: #5 "(F) Friendly population factors (including related Lost Colonist population) are under the control of alien sovereigns (i.e. other Major Positions)." and #9 "(F) The position has lost a colony to alien conquest within the last three turns."
- On EGT9, one d10 is rolled, resulting in Conflict Check: #4 "(F) Position has not lost any Warships, Logistical Ships, Bases, or Fighters or fired any Ship Missiles in Combat in the last two turns (in order to lose something in combat, you have to be involved in a combat...)."
- Note that Conflict Checks which begin with (T) pass if they are objectively true, and Conflict Checks which begin with (F) pass if they are objectively false.
- Taken together, the final Estate Title looks like this:
  1. (T) No other **alien colonies** exist in systems where a Friendly Colony is located or all **alien colonies** in a starsystem with a Friendly Colony are owned by the position.  
[Must be TRUE to pass]

2. (F) Friendly population factors (including related Lost Colonist population) are under the control of alien sovereigns (i.e. other Major Positions). [Must be FALSE to pass]
3. (F) The position has lost a colony to alien conquest within the last three turns. [Must be FALSE to pass]
4. (F) Position has not lost any Warships, Logistical Ships, Bases, or Fighters or fired any Ship Missiles in Combat in the last two turns (in order to lose something in combat, you have to be involved in a combat...). [Must be FALSE to pass]

Players are free to name Social and Estate Titles whatever they wish, I might call this one an ugly bit of xenophobia. To satisfy all of the Conflict Checks the position would 1) need to have exclusive control of all stars where they have Friendly Colonies, 2) control all population factors of their Native Population Type in the game, 3) not lose any colonies to alien attackers and 4) lose ships, bases, fighters or fire Ship Missiles in combat every two turns. This Title may be one of up to ten choices available to the position and the position may choose to install it when conditions warrant.

Finally, the last step, a die roll indicates that two Vital Powers are associated with this Estate Title, and two more rolls result in the Taxation Power and Combat Power being associated. I smell ‘evil’ empire! And it’s not a new type of cologne.☺

---

*“Here, again in short, Christianity got over the difficulty of combining furious opposites, by keeping them both, and keeping them both furious. The Church was positive on both points. One can hardly think too little of one’s self. One can hardly think too much of one’s soul.”*

– G.K. Chesterton, Orthodoxy, Ch. 6 (1908)

---

**Furious Opposites:** The two-party system of the United States is often one of furious opposites, more so lately. Contradictory or seemingly irreconcilable Conflict Checks are possible and allowed (the example above is rather straightforward); they should not be rerolled. Contradictions require creative and emergent explanations and are not unknown to history:

- ✓ For example, as a youth in Italy, Louis-Napoleon Bonaparte was involved with the Italian resistance to the Austrian occupation of Northern Italy. He and a friend eventually fled across the French border to avoid arrest.
  - Decades later, when he overthrew the French Second Republic and became Emperor Napoleon III (1852-1870), he personally led French troops to join those of Piedmont-Sardinia in a war to oust the Austrians from Italy in 1859 and was present at two battles (following his Principle of Nationalities). Like his famous namesake, he could claim to fight the Austrians in Italy, nominally for the liberation of Italy from the Habsburgs.
  - However, the French Catholics were a strong force in French popular politics such that, as Prince-President of the Second Republic, Louis-Napoleon Bonaparte was pushed into supporting French troops sent previously

to protect Rome (and to restore the clerical power in the Papal States), which was then temporally ruled by the Pope, and those French troops fired upon *Republican* Italian troops led by Garibaldi in 1851 who sought to liberate Rome for the new Italian Republic. The French troops in Italy were resented as occupiers propping up a corrupt regime by both the population of the Papal States whose clerical rulers were reactionary, inept and corrupt, and by the Republican elements in French society (similar to the U.S. experience in South Vietnam<sup>3</sup>). Thus the Prince-President (and future Emperor) was forced to attempt to broker compromises between the Pope, papal supporters (e.g., Ultramontane party) and radical republicans.

- Later, after the war with Austria, Emperor Napoleon III was forced to continue defending Rome (despite his own nationalist beliefs) against liberation attempts by Garibaldi in 1862 (Garibaldi was arrested by the Italian government) and 1867 (Garibaldi was defeated in battle with French and Papal troops); Garibaldi finally captured Rome in 1870 after the final evacuation of French troops following Sedan. Rome then became the capital of modern Italy and the Pope retained the sovereign Vatican.

- Pool of the Abyss: The pool of emergent Government Titles (the Foresight, see *The Power to Choose*, 5 Beginnings, p. 50, *supra*) generated at the beginning of the game will remain available to the position during the game for use whenever a change of Social or Estate Titles occurs. At the discretion of the Concierge, new emergent Government Titles may be generated from time to time during the game whenever necessary – for example, if all Social or Estate Titles have been used, or possibly some titles may ‘age-out’ of the pool every ten turns to be replaced by new potential Government Titles.

However, caution should be exercised in replenishing the pool before it is fully drained – as Government Title changes are made during the game, the players will first take those they like the most, are most comfortable with, leaving less immediately desirable titles in the pool. Later in the game, this may cause positions to ‘evolve’ in another direction, for example, from peace to xenophobia and war, or vice-versa, as their civilization changes with a succession of Titles. Replenishing Titles in the pool prematurely may alter the course of the game.

- Sides of the Coin: Conflict Checks that require a Power activation or event to have occurred within X turns, or that a certain condition currently exist, guide the position’s conduct by requiring the position to do or not do certain things in the game *as long as the position is interested in not failing that Conflict Check*, that is, the position players must be diligent and cognizant. A position may, at its own risk, allow or cause a particular Conflict Check to fail by action or inaction.
  - ✓ Most Conflict Checks are capable of multiple interpretations, for example, does “(T) Position has Naturalized a Converted Colony within the last five turns” imply an empire building or imperialist drive, or does it suggest a developing pan-galactic civilization? It depends which side of the argument you embrace, but within GGDM’s standard rules, only Converted Colonies can be Naturalized. And only Conquered Colonies can be Converted. And colonies don’t get conquered on their own will.

- ✓ Participants should be cognizant that some actions which seem positive can cause a Conflict Check to fail. For example, a Conflict Check that reads, “(T) No Naturalized, Converted or Conquered Colonies owned by the position are within Short Movement of the Capital Colony at the current best ship movement speed” can be caused to fail by increases in Ship Speed, by moving the Capital Colony, etc. It can also cause the position to destroy **alien colonies** by Orbital Bombardment if they are too close, rather than Conquering them, or it might cause the position not to attack and conquer those colonies, providing an umbrella of sorts. Or maybe the position simply doesn’t increase Ship Speed.
- ✓ While some Conflict Check fails are permanent and some Conflict Checks may fail as soon as the Government Title is active (as long as the Title isn’t instantly disrupted, see A House Divided, 5 Government Titles, p. 637, *infra*), in most cases, there is some grace period to restore the conditions necessary before all other Conflict Checks fail and the Government Title is disrupted. For example, “(T) The position had either a successful Research Attempt or Development Attempt last turn” can fail one turn and then ‘un-fail’ or pass the next turn, depending on many factors, including luck, in research and development. *Past failure has no effect on Conflict Checks*. As long as it was not the last Conflict Check to fail, the Government Title will not be disrupted.

---

*“My attitude toward progress has passed from antagonism to boredom. I have long ceased to argue with people who prefer Thursday to Wednesday because it is Thursday.”*

– G.K. Chesterton, *New York Times Magazine*, February 11, 1923 (from the website of The American Chesterton Society)

---

*“There are two kinds of fools: one says, ‘This is old, therefore it is good’; the other says, ‘This is new, therefore it is better.’”*

– Dean William Ralph Inge, *More Lay Thoughts of a Dean* (1931) <sup>4</sup>

---

**Second Sight:** The first group of Themes created were the Interstellar Civilization Themes which simply followed through the sections of GGDM rules in order, so the ICT (i.e. Interstellar Civilization Themes) are really ‘GGDM game themes’ and can be followed in that manner if participants wish to create or add their own.

- ✓ Second sight is another term for intuition, see discussion in Foresight, 2 Colleges, p. 472, *supra*. Sometimes I have felt second sight in the design of GGDM when decisions I make lead to unintended, unanticipated, but pleasing developments or incidentally solves design problems in other parts later. Here I use the term more literally and humorously in reference to ‘doing over’ the Government Titles design in 2018.
- Lowering the Drawbridge: In working through the Themes for emergent Estate Titles, I have found that it comes down to a couple of basic questions of understanding (for those who may wish to create or add their own Conflict Checks and Estate Title Themes):

- ✓ **What does X occupy?** It is said, not without reason, that possession is nine-tenths of the law. This is the question of what X group owns in society, more specifically, what critical real estate (the Castle, both literally and figuratively) is owned by X group. This is not a question of whether what they are doing with it is beneficial to society (that is more in the territory of Social Titles), only that it is critical enough to society to create power, control, wealth, etc. In this way, the medical profession is in the same place as a drug kingpin, excepting that one is legitimate and regulated and the other is illegal and prosecuted.
- ✓ **What is characteristic of X group?** This question I have found covers more diverse situations, such as the Youth Bulge, by allowing a historical approach. For example, what was characteristic of the post-Roman Scandinavian Youth Bulge? Viking raids, invasion of England and France, migration into the Ukraine (e.g., the *Rūsīyyah*, the Kievan Rus' polity). So this youth pressure can be translated then into objective game terms of what it would take to maintain an Estate Government Title based on the youth bulge (e.g., baby boomers, youth *as an Estate*). Occupy Wall Street?
- **Flying the Banner:** Social Titles can likewise be framed in a couple of questions similar to Estate Titles:
  - ✓ **What is their ideal result?** This is similar to what does the group want, however, distinguishable in that the social movement has the most power before the ideal result is achieved and significantly less power afterward or the closer they get.<sup>5</sup> Thus, social movements are often self-defeating. An egregious example is the early 20<sup>th</sup> Century Temperance Movement which reached the height of its power with the ratification of the 18<sup>th</sup> Amendment to the U.S. Constitution (i.e. the Prohibition). The unanticipated effects of the Prohibition were a massive jump in the power, wealth, and organization of criminal syndicates, an increase in their armaments and chaos, resulting in a substantial increase in Federal police power and further erosion of the power of the states to the central government to combat social ills that transcended state borders. The Prohibition was ended by the 20<sup>th</sup> Amendment fourteen years later, but the temperance idea collapsed, substance abuse was 'accepted' as a fact of civilization and it has been very hard for subsequent efforts to curb its growth or stop the sophisticated illicit power of violent criminal cartels.

Although the preceding is framed in terms equating a Social Title to a historical social movement, it is not helpful beyond basic understanding to equate all Social Titles with the type of social movements that are historically famous (e.g., the Civil Rights Movement or Gandhi). Social movements represent the ideals and desires of society (whether good or ill in the long run, e.g., the March on Rome 1922) and only those who meet the greatest resistance and have the greatest support on the other side become the conflicts we know in history. Many and rather tamer social movements are going on at any given moment in a civilization, e.g., current civilizations desire prosperity, some kind of conformity, obedience to authority, and continuation of whatever makes civilization work and continue into the foreseeable future.

- ✓ **What is the practicality of the ideal?** Seemingly, the greater the ideal, the less attainable it is in any practical sense. This works as a dynamic; the ideal survives because it is great and distant (*ut supra*), but at the same time, attracts little serious support because it is great and distant, seemingly unattainable and impractical. Social

movements that take hold are those that seem to offer some immediately attainable ideal or goal, but those movements are also the ones most likely to lose momentum after initial political success.<sup>6</sup> An example of this might be the triumph of labor in the U.S. in 1935 and 1938 with the Wagner Act, the FLSA, and the height of union power in the early 1960s, the Equal Pay Act of 1963 and Age Discrimination Act of 1968. Although additional rights have been created for labor, union membership and effectiveness has declined since the mid-1970s (I remember the ‘wildcat strikes’ in the 1970s) as organized labor has achieved all of its goals generally, corruption and organized crime had infiltrated the unions (e.g., Jimmy Hoffa), and parental government and successful litigation secured the results of the crusade. Much the same can be said of the Civil Rights Movement: Ultimate legal and legislative success has sapped momentum, leaving only a residue of political correctness and media reporting of continued systemic discrimination (e.g., disproportionate criminal sentencing).

This is useful in explaining much of the sociopolitical history of the 20<sup>th</sup> Century, to greater or lesser degree depending on circumstances, peculiarities and details of each situation. The initial goals of the Russian Communist revolution: Overthrow of the tottering *ancien regime* and establishment of a worker’s state, were immediately attainable in the shadow of WWI, even if at great cost. The practical realization of the rest of the ideology, the promises ... well, the history speaks to that. Within ten years (and after the defeat of the Soviet invasion of Poland in 1920), the same old power and corruption crept into the new institutions (“Meet the new boss, same as the old boss.” – The Who), and the German invasion of Russia in 1942 probably extended the existence of the Soviet Union by 30 to 50 years because they won the war (like a successful cancer treatment can extend the life of a terminal patient).

- Into the Breach: Estate vs. Social Titles might then be characterized as a contrast of control of civilization’s needs vs. wants (or possibly in philosophical terms, *is vs. ought*, see 2 Culture, p. 374, *supra*). At the bottom of all of these questions is the last question of how to form a true or false query from game data which will represent some aspect of the questions being asked for that Government Title Theme. In a larger sense, this is the entire process of GGDM design in a nutshell.

The actual process is one of picking your spots, especially when creating the Social Titles, I have found that there are thousands of words that express concepts about our civilization, history, what sort of society we are descriptively, but not all, in fact, a surprising few are actually expressible as Government Title Themes. Many words, such as you might describe our civilization as empirical or materialistic or oligarchic, are included within the range of other terms in GGDM, such as Constructural Elements, Colleges, or Technology. Many concepts do not have any expression in game terms, for example, the discussion of mythopoeic thinking and parallelism in *More Than a Feeling*, p. 808, and *The Fine Print-isms*, p. 811, 1 Temporal Technology, *infra*. What usually happens is that I am working, watching television, sleeping or walking to work, and my mind is deep processing; suddenly it will all come together, a theme and several possible Conflict Checks will emerge into my consciousness.

- ✓ “The architecture supporting our conceptual knowledge of abstract words has remained almost entirely unexplored. By contrast, a vast neuropsychological, neurolinguistic and neuroimaging literature has addressed questions relating to the structure of the semantic system underpinning our knowledge of concrete items (e.g. artefacts and animals).” – Sebastian J. Crutch, Elizabeth K. Warrington, from abstract of “Abstract

and concrete concepts have structurally different representational frameworks,”  
Brain, Vol. 128, Is. 3, March 2005, pp. 615–627 (free article on Oxford Academic).

*“And the world looks just the same;  
And history ain’t changed;  
‘Cause the banners,  
They are flown in the next war.”*

– The Who, “Won’t Get Fooled Again” (1971)

**Won’t Get Fooled Again:** For participants who wish to design their own new Social or Estate Title Themes, there are ‘cardinal sins’ to avoid when writing new Conflict Checks:

- ✓ Avoid Conflict Checks which can never fail, e.g., “(T) Position has stardrive technology” passes 99.99% of the time and cannot fail once it passes. Conversely, there are Conflict Checks that can fail permanently – perhaps a cosmic negativity bias.<sup>7</sup>
- ✓ Avoid self-fulfilling Conflict Checks, e.g., “(T) This title has never been disrupted” is bad because the Conflict Check can never fail, and so the Title can never become disrupted.
- ✓ Avoid Conflict Checks that do not require regular affirmative action (e.g., Power Activations, RPs spent) or that do not curtail the position from doing something the members may want to do (checks and balances, decisions are made) to pass each turn.
- ✓ Avoid turn requirements that are too long (e.g., “(T) Expansion Power has been activated at least once in the last 20 turns,” – one activation would allow the position to pass the Conflict Check for 20 straight turns, making the Title undisruptable).
- ✓ And avoid Conflict Checks that are impossible or convoluted (I certainly pushed the envelope a few times on this one).

*“But this involved accuracy of the thing makes it very difficult to do what I now have to do, to describe this accumulation of truth. It is very hard for a man to defend anything of which he is entirely convinced. It is comparatively easy when he is only partially convinced. He is partially convinced because he has found this or that proof of the thing, and he can expound it. But a man is not really convinced of a philosophic theory when he finds that something proves it. He is only really convinced when he finds that everything proves it. And the more converging reasons he finds pointing to this conviction, the more bewildered he is if asked suddenly to sum them up.*

*Thus, if one asked an ordinary intelligent man, on the spur of the moment, ‘Why do you prefer civilization to savagery?’ he would look wildly round at object after object, and would only be able to answer vaguely, ‘Why, there is that bookcase . . . and the coals in the coal-scuttle . . . and pianos . . . and policemen.’ The whole case for civilization is that the case for it is complex. It has done so many things. But that very multiplicity of proof which ought to make reply overwhelming makes reply impossible.”*

– G.K. Chesterton, Orthodoxy, Ch. 6 (1908)<sup>8</sup>

## Endnotes.

<sup>1</sup> Citation: The entire book is available for free online at LeadershipU (leaderu.com), a Christian apologetics website. The copyright would long ago have expired.

<sup>2</sup> Commentary: Admittedly, the Conflict Checks being written in 2018 are, unlike the previous Government Titles, being written on the assumption that the Conflict Checks will be assisted by automation and not involve the Concierge poking around the data. If the game data is properly tagged, and the checks are objective, I am certain that a query can be written for each of the 600 Conflict Checks.

<sup>3</sup> Commentary: The French occupation of the Papal States was similar to the U.S. experience propping up the corrupt, inept government of South Vietnam, except in one very important respect – the cultural, historical and linguistic differences, and climate and geography, between Western troops and Indochina was much greater and the environment much more alien and hostile. This is *the more likely condition* in GGDM situations.

<sup>4</sup> Commentary: One can imagine from this statement that Dean Inge had little patience with ‘old tyme religion’ tent revivalists who were popular across the United States in that time (e.g., the subject of Neil Diamond’s song, “Brother Love’s Traveling Salvation Show” (1969)).

<sup>5</sup> Commentary: Though it might not be considered a ‘social movement,’ the First Crusade is a perfect example of the phenomena. Though the leaders feuded, lingered and delayed after securing Antioch in June 1098 (this is the strange incident of the Holy Lance of Antioch described in White Rose, 1 Constructural Elements, p. 178, *supra*), eventually the rank and file forced them (on threat of mutiny and disorder) to continue to Jerusalem, the ultimate goal of the Crusade. *Jerusalem was the only objective that kept them together.* After five months of marching, the Crusaders finally reached Jerusalem in July 1099 and in a week, captured the city by a bloody assault that turned into a massacre of the population. After the capture of the final objective, the leaders continued feuding over rule of Jerusalem, and two factions left with their men for Jericho. The only event that brought them back together was the approach of the Fatimid army threatening to recapture Jerusalem. In August 1099, the reunited Crusader army, in an audacious surprise dawn attack routed the Fatimid army of twice their size at the Battle of Ascalon, looted their camp, and returned to Jerusalem. Satisfied that they had met their obligations, shortly afterward most of the First Crusade army returned to Europe, leaving a token force behind.

<sup>6</sup> Commentary: Placed in this context, it is not surprising at all that the sociopolitical ideals represented by the Articles of Confederation, ratified in March 1781, just over seven months before the British surrender at the Siege of Yorktown (thus, ratified in the height of the Revolution), quickly faded and were replaced by the dualistic U.S. Constitution in June 1788. In a certain pro-states or libertarian view of history, this was the innocuous beginning of the leeching of power from the states to the central government which has been continuous and accelerated significantly after the American Civil War and after the Great Depression-WWII era.

<sup>7</sup> Commentary: That is, every living thing is mortal, we have not yet discovered any life that is immortal. *See?*

<sup>8</sup> Commentary: I read from or about writers such as G.K. Chesterton, Alexandria Petri, Eric Hoffer, Nadja Kornith, Bertrand Russel, Kate Becker, J.B. Bury, Amanda Hess, or Joseph Tainter, and I think, wow, I’d like to sit and talk with these people. But the desire for conversation would be purely one sided, within a minute or less any one of them would figure out that I am a lightweight (a term I saw applied in an article to Sebastian Gorka) non-conversational schmuck. I would end up just mumbling my admiration for their work.

- ✓ I have thought from time to time since my youth of what I call the fantasy dinner; a gathering of intellects in a particular field around a dinner table for eight. I might imagine, for example, a dinner with Tom Clancy, Sir John Hackett, Frank Chadwick, Col. Harry Summers, Lynn Montross, Prof. Tom Nichols, and Col. Trevor N. Dupuy (yes, I know that most of them are deceased as of 2020 ... this is a fantasy dinner, that is the way those things usually work). And there I sit or stand in the eighth seat, which might appear empty since I am but a garden gnome peering from behind the edge of the table, over the table cloth, just quietly listening to these men talk shop, hoping not to be noticed because I have nothing useful to add. But for the fact that this is my fantasy dinner, the eighth seat could be better used, perhaps one of the West Point editors, or Rear Adm. Alfred Thayer Mahan, or Generals McMasters or Schwarzkopf would attend as guest speaker and I could just sit in the window behind the curtain. I am in any event expendable, and every military man knows what that means (life expectancy in combat, 3 minutes or less), mission first, don’t screw it up. Thus GGDM may actually stand for *Garden Gnome, Discarnate Manifestations.*☺

*See Appendix IP – Interventions Reference Sheet*

*“Broadly speaking, I would define the two camps as governing versus anti-governing. Ideologically, each camp shares many of the same principles. However, the difference in strategy is vast, to the point of total divergence. The governing conservatives actually want to, as the term suggests, govern. They want to win elections and affect public policy through available means. I emphasize the word ‘available’ because it’s the crucial distinction from the anti-governing crowd. The latter just wants what they want, with little to no regard for how things actually work.*

*Both camps are willing to ‘fight in the trenches,’ but to wholly different effects. The governing conservatives want to secure public policy consistent with their principles and values. The anti-governing crowd wants the cathartic affirmation of ‘being right,’ a feeling mostly secured through retweets, likes, and internet memes.... In lieu of statesmen, the intraparty contest has been between two types of impotents, those who get elected and accomplish nothing, and those who accomplish nothing because they can’t get elected. Neither proves particularly useful. We need a new breed.”*

– Walter Hudson, [pjmedia.com](http://pjmedia.com), October 10, 2016

**Immoderate Unhappiness:** *Is vs. ought.* Frustration, apathy and general ignorance lead people to “just want(s) what they want, with little to no regard for how things actually work” (*ut supra*). Frustration is our biggest enemy, impatience is its agent provocateur. This is just another long way of classifying certain parts of the electorate as juvenile or childish; as impatience, ignorance and inexperience are not considered virtuous in Western Civilization. When enough of the electorate or those who have a say, fall into this category, combined with other political circumstances, the result may be what is now called a populist movement or populist uprising, both of which terms are slightly derogatory in the current media. Frustration, apathy and general ignorance, populist movements and uprisings are common human factors the Concierge could consider in use of Intervention Potentials and storytelling in GGDM. Some group will *always be* ☹.

- ✓ “‘Immoderate people tend to view the world in black and white, as uniformly bad or good, and they are unable to appreciate positions in the middle,’ said Aurelian Craiutu, a political-science professor at Indiana University... ‘No doubt on health care, the final outcome will be something in the middle,’ Craiutu said. Trump’s ‘inability to appreciate that is a sign of immoderation. There are moments in history, where we are fighting against Hitler or Stalin, when that works. But there are certain issues, such as health care, where compromise is part of the democratic process.’” – David Nakamura (quoting Aurelian Craiutu), “Trump’s Penchant for Extremes worked on the campaign trail but hinders his White House,” *Washington Post*, July 19, 2017.

Their .012 Reich (12 actual years divided by the promised 1,000 years) crumbling around them and having met with complete futility for their radical ideology, the lower order officers of the Third Reich engaged in a flurry of vengeance killings in the last two or three months before the surrender. They, in addition to killing as many Jews as they could find, took out their frustration by killing political prisoners and dissidents, whom they blamed for their loss (particularly those of the Red Orchestra and members of the Confessing Church) without even the pretext of proceedings or due process (by drumhead court-martials or simply by orders, after the destruction of the People’s Court during an air-raid in February 1945). Many also committed suicide to avoid accountability or because they could not endure their own bitter futility.<sup>1</sup>

- ✓ “I hope that people can stay focused enough to realize that we need to make this an aberration and not our reality.” – John Meacham, Morning Joe, June 18, 2020.<sup>2</sup>

*“Man is a religious animal,’ Mark Twain once said, and while some claim that America is becoming a more secular nation, we never become less religious. We just trade formal religions for informal ones, politics being chief among the faiths in the latter category. When we view our presidents as either messiahs or anti-Christ, and when we believe that election results will yield either utopia or Armageddon, politics has become our religion, our preferred parties have become our creed, and those of differing persuasions have become the heretics whose blasphemy must not be tolerated.*

*So it shouldn’t come as a surprise when political sectarians sidestep actual discourse and pull the Peanuts football trick to score some cheap points against their rival zealots. It also shouldn’t come as a surprise when those who are invited to partake in the supposed interfaith dialogue refuse to play a game they know is rigged against them.”*

– Hans Fiene, “The Peanuts Football Trick Explains Why Conservatives Keep Quiet About White Supremacy,” August 16, 2017<sup>3,4</sup>

**A House Divided:** A disrupted Government Title cannot be used to *activate* a Power and will not receive *an Act or Scene*. When a Government Title is disrupted, it may be either restored or abandoned. A disrupted Social or Estate Government Title may automatically be restored by activation of the Order Power for the purpose of Government Formation when:

- 1) The Government Title would not automatically become *disrupted* as of the beginning of the turn it is restored. This amounts to an ‘instant’ extra Conflict Check.
- 2) There is sufficient open space to legally place the Government Title in the Public Space (positions should avoid placing new pieces in the empty space).
- 3) The position currently has less than five undisrupted Government Titles.
- 4) And no new Government Titles have been added since the Title to be restored was disrupted (restoration of other Titles do not count as ‘adding new Titles’).

If the Order Power is activated to restore a disrupted Social or Estate Government Title and it cannot be restored for whatever reason, the Power activation is wasted (thus positions may attempt many times to restore a disrupted Title). When a restored Government Title is placed in the Public Space, the position may, but is not required to (unless by a violation of the Structural Government Title), shift any number of Pathways to the restored Government Title, with possible adverse consequences if items occupying Monads need to be moved or lost.

Automatic restoration by activation of the Order Power for the Purpose of Government Formation *does not apply* to disrupted Structural Titles which has a different criteria, see World Powers Fall, 3 Government Titles, p. 617, *supra*.

- ✓ “When Americans think of public policy in terms of scoring wins or losses, dumpster fires like the last two Obamacare repeal efforts are inevitable. ... GOP legislators know that their base isn’t interested in the mumbo-jumbo of actual health care experts. These voters are not interested in analysis, or extended debate. They don’t care who’s in favor of it or who’s against it, or for what reason. They’ve been told that Obamacare – which they hate – would be repealed, and the Affordable Care Act

– which they like – would be improved. If that sounds strange, remember that a third of all voters and about a quarter of GOP voters don't realize these are the same things, and that's the rub. No amount of expert testimony is going to change anyone's mind about Obamacare. What the most vocal and angry part of the Republican base wants is a repeal of this thing called 'Obamacare' because it is a political symbol and because President Trump promised them it would be repealed, totally and completely, on day one of his administration. What that would mean is as much a mystery to those angry voters as it is to many of the senators who supported that repeal.”

– Tom Nichols, “Health Care Fail: GOP caves to ignorant voters who want revenge, not facts,” USA Today, September 29, 2017.

- **This Old House:** Restoration with a capital “R” is a term commonly used by historians for this exact process, the reversion of rule to the previous elites or authorities. Historical restoration examples include the Kenmu Restoration and Meiji Restoration in Japan, the European Restoration (post-Napoleonic, there are many sub-Restorations under this umbrella), and the Restoration of 1660 (Charles II of England). The term, with a capital “R,” can also be used doctrinally in organized religion. In fantasy fiction, the historical-fantasy writer, Katherine Kurtz, prominently featured the Haldane Restoration, where normal humans overthrew an entrenched Deryni (humans with genetic magic and psychic powers) invaders’ monarchy and peerage, and placed an heir to the last human king on the throne.

- ✓ Restoration is also used to refer to a resurgent period of a tottering state, e.g., the Komnenian Restoration of the Byzantine Empire beginning with the reign of Alexios I ten years after the disastrous defeat at Manzikart. The Komnenian Restoration did not involve either reversion to a previous form of government, or previous dynasty (e.g., the Bourbon Restoration) or elite ruling group, but rather, the restoration of the Byzantine Empire to vitality and viability. The Pechenegs were the first victims, in typical Byzantine fashion, Alexios convinced the Cumans to turn on the Pechenegs; they destroyed the Pechenegs and then he drove the Cumans back across the Danube. Such a restoration may occur in GGDM, but is not the use of the term here.

- **Three Kingdoms:** A disrupted Government Title may not be abandoned unless its holder is maintaining at least three undisrupted Government Titles. This can result in a quagmire if positions do not choose and act carefully. New Social or Estate Government Titles may be added while another Title of any kind is disrupted.

A new Structural Title may be added only if the current Structural Title is disrupted. However, a position may never have two *undisrupted* Structural Titles at the same time. Adding any new Government Title, of course, will prevent the restoration of any of the currently disrupted Government Titles and they are then considered abandoned, unless there are not currently three undisrupted Titles (*ut supra*).

Consider what events and conditions would need to occur to restore any of the monarchies that were toppled by popular revolutions, wars, and historical shifts of the 18<sup>th</sup>, 19<sup>th</sup>, and 20<sup>th</sup> Centuries. Curiously, there is a political party in France (Alliance Royale) that is still seeking to restore the monarchy and Prince, Jean d’Orléans, Duke of Vendôme, with aspirations of continuing the royal line to a day the monarchy might return. How serious are they?

However, it's always a matter of conditions: Consider the ‘managed democracy’ trajectory of Russia<sup>5</sup> – Russia is effectively a nuclear-armed 21<sup>st</sup> Century Roman *Principate*:

- ✓ “One of Russia’s most influential business magnates on Wednesday said the country has become a ‘quasi-monarchy’ – a sign of how President Vladimir V. Putin’s move this week to clear the way to rule until 2036 has changed the landscape of Russian politics. Not that the magnate, Konstantin Malofeev, was complaining. A nationalist financier with Kremlin connections and his own TV channel, Mr. Malofeev has spent decades agitating for a restoration of royal rule. In an interview with The New York Times, he said that after this week’s flurry of events, he had never been closer to his goal. ‘The quasi-monarchy that we basically now have is a very good thing,’ Mr. Malofeev said at his ornate office on Moscow’s Garden Ring. Referring to Mr. Putin, he went on: ‘If we were now to start calling him emperor, not president, then we wouldn’t have to change much in the Constitution.’...”

The message in the pro-Kremlin news media Wednesday was that Mr. Putin had chosen a democratic path to preserving stability in Russia by keeping himself in power. Mr. Putin emphasized that the amendment allowing him to run again would need to be approved by the Constitutional Court and by a nationwide vote. The April 22 plebiscite had already been scheduled as a vote on other, less consequential constitutional amendments that Mr. Putin introduced earlier this year. ... Success in the plebiscite and in the Constitutional Court appears assured, however, given the Kremlin’s control of the judiciary and the electoral system.” – Anton Troianovski, “A New ‘Emperor’: Russia Girds for 16 More Years of Putin,” New York Times, March 11, 2020.

- The Ends of the Circle: A disrupted Government Title that has been abandoned previously may only be subsequently re-added as a ‘new’ Government Title *at the discretion of the Concierge*. Positions will not generally be allowed to abandon disrupted Government Titles and then add them again later as a new Government Title. It is not impossible that this could happen, but improbable. In considering the issue, the Concierge will look at the current conditions, the story arc of the game, and the amount of time elapsed since the Government Title in question was abandoned. The addition of the previously abandoned Title may be related to other events, such as a Reformation or local revolt.
  - ✓ “If we beat the King ninety and nine times yet he is king still, and so will his posterity be after him; but if the King beat us once, we shall be all hanged, and our posterity be made slaves.” – Earl of Manchester, English Civil War (1642-1651).
    - The Earl of Manchester is historically recorded as having expressed this sentiment, but it is also included as dialogue in the 1970 movie Cromwell, where the Earl is erroneously shown sitting in the House of Commons. Cromwell replied, “Then why are we fighting this war?”

It is likely that the leaders of the American Revolution were familiar with this statement, as have all revolutionary leaders for the last three centuries. One solution to the problem is to execute the king, which they did in 1649. The French followed suit in 1792, the Russians in 1918, a century years ago:

- ✓ “The Tsar’s family was a victim of the principle that form the very axis of monarchy: dynastic inheritance” – Leon Trotsky.<sup>6</sup>
- ✓ Cromwell remains a ‘great Englishman’ because he refused what Napoleon could not: A Crown. At least as a formality. All the window dressing and trappings were there.

*“According to elite-focused theories of regime transitions, democracies remain stable when they are in a ‘self-enforcing equilibrium,’ meaning when all major political actors favor the status quo because it serves their own interests as they see them.”*

– Hubert Tworzecki and Radosław Markowski, “Why is Poland’s Law and Justice Party trying to rein in the judiciary,” *The Washington Post*, July 26, 2017

**Shattered States:** The 1990 board game, *Shattered States*, by Karstan Engleman and David Spencer, posits a future civil war between regional warlord factions of the United States following detonation of a nuclear weapon in Washington, D.C. by a terrorist during the State of the Union address. The game ends with no winner if the United States cannot be “reunited” in five to eight years (since this is a wargame that means military victory over rivals): *the memory and vision of the United States, and hope of restoration will begin to fade from the common memory as regional warlords carve out new polities*. I believe this idea was floating around in the 1970s and 1980s, as I have seen it once or twice in other literature from the late Cold War period.

- ✓ *Shattered States* should not be confused with the similar 2005 video game, *Shattered Union*. But this time, it is a nuclear weapon detonated in Washington, D.C. during the Inaugural Ball in 2012. Wonder where they got that idea?

What happened when the last Western Roman Emperor, Romulus Augustulus (of questionable legitimacy) was deposed by the Goth leader and Roman army officer Flavius Odoacer in 476 A.D.? Odoacer and the Senate of Rome placed the imperial insignia and emblems on a ship and sent them to Constantinople. The Eastern Roman Emperor Zeno, who had his own problems, granted Odoacer a meaningless title (*patrician*) and didn’t press the issue and the Senate of Rome proclaimed Odoacer King of Italy.

- ✓ “Odoacer advanced on Ravenna, capturing the city and the young emperor after the short and decisive Battle of Ravenna. Romulus was compelled to abdicate the throne on 4 September 476. This act has been cited as the end of the Western Roman Empire, although Romulus’ deposition did not cause any significant *disruption* at the time. *Rome had already lost its hegemony over the provinces*, Germanic peoples dominated the Roman army, and Germanic generals like Odoacer had long been the real powers behind the throne. Italy would suffer far greater devastation in the next century when Emperor Justinian I reconquered it in the Gothic War.” – from Wikipedia article, “Romulus Augustulus,” December 9, 2018 (emphasis added *for GGDM game terms purposes*).

When the last living, generally accepted, previous Western Roman emperor, Julius Nepos (predecessor to Romulus Augustulus), was assassinated in 480 A.D., nobody cared and no one sought to revive the Western Roman Empire at that point. Roman Emperor was a meaningless title, cursed with the weight of history, outmoded in the new age, no one was willing to fight for it or even to place a claim. Romulus Augustulus may have outlived Odoacer by more than 20 years (no one is sure when he died, how or where, no one cared), but never sought to reclaim the throne. Thus, the Western empire faded to black.

- ✓ However, Emperor Zeno persuaded the Ostrogoths to enter Italy in 489 A.D. and dispose of Odoacer, while they were fighting, the Burgundians started raiding, then the

Visigoths joined with the Ostrogoths against Odoacer. The various tribes and factions slugged it out until peace was negotiated by the Bishop of Ravenna in 493 A.D. Then the Ostrogoth leader killed Odoacer while they had dinner, and massacred his family and the rest of his army. The Ostrogoths then ruled Italy.

- ✓ Later Eastern Roman Emperors warred against the Ostrogoths from 535-554 A.D., the Ostrogoths were effectively destroyed and lost their politico-ethnic identity and suffered social collapse (like the Samnites after the Social War in 90 B.C.<sup>7</sup>), and the Byzantines reconquered (and depopulated) the Italian Peninsula temporarily, but lost most Italian territory to new invaders (e.g., Lombards in 568); the Byzantines held onto footholds here and there for a few centuries.
  - The word “byzantine” (not capitalized) comes down to us with a Machiavellian meaning for good reason. See also Manzikert discussion in 2 Construction, p. 671, *supra*.<sup>8</sup>
- The Last POTUS: A 16-year old was appointed President of the United States by his father, the Mayor of Pittsburgh, the final Capital of the United States of America. The U.S. Constitution long irrelevant, the appointment was confirmed by a single-candidate election held in western Pennsylvania, parts of eastern Ohio, northern West Virginia, southwestern New York, and some neighborhoods in Chicago and Cleveland; the rest of the United States being permanently lost to the Federal Government. Shortly thereafter, the Pittsburgh militia was defeated by mutinous migrant mercenaries in the service of the U.S. Army, stationed at the church across from Castle Village, at the Battle of Carrick.

The mutineers overran the headquarters at the Carrick Super-Mall (the largest remaining mall in North America) and fought their way up the broad hillside over sprawling hillside cemeteries – Carrick is where people have long gone to be buried – and over house-lined terrace streets to the top of Brownsville Road and Arlington Avenue. The Mayor in command and President were captured. The President of the United States resigned and his fate is unknown to history; allegedly he lived for a while in West Virginia under the supervision of the Duke and is said to have wandered away into the mountains. Afterward, there are no further Presidents of the United States; the world moved on. The U.S. Senate, meeting in the library of the former Duquesne University (now “Capitol Hill”), proclaimed the victorious mercenary general as King of Pittsburgh and Ohio and his four sons as Prince of New York, Duke of West Virginia, Captain of Cleveland and Mayor of Chicago.

- ✓ “At 127 years of age, Stewart Adler, the last living citizen of the former United States of America, is invited to his hometown university to speak about his once-great nation’s fall into a state of complete and total societal and economic collapse. But more interestingly he describes its transformation back into a new and very different country.” – J.A. Willoughby, author summary of “Promised Land” (2014) on Goodreads.
- ✓ See also the 2006 television series, *Jericho*, which ran for two seasons, and the third and fourth seasons have been published as official novels. These are examples where the Structural Government Title of the United States of America would be disrupted and/or abandoned.

---

*“The Tree of Liberty must be refreshed from time to time by the blood of patriots and tyrants.” – Thomas Jefferson*

---

*“The winds of change blow straight into the face of time.”*  
 – Scorpions, “Winds of Change” (1990) <sup>9</sup>

---

**Winds of Change:** If Thomas Jefferson were alive today, he would be on the FBI Terrorist Watchlist.

A position may attempt to *voluntarily* change any number of its Social and/or Estate Government Titles by activation of the Order Power for that purpose once for each proposed change. The ‘cabinet’ of Government Titles may be voluntarily changed by either adding a new Government Title and/or removing an undisrupted Government Title (like shuffling ministers and portfolios). At the end of any Regular Turn where there is a change in Social and/or Estate Titles, the position may not have more than four undisrupted Social and/or Estate Titles combined, and must have at least two undisrupted Social and/or Estate Titles in any combination (the min-max).<sup>10</sup>

Change or disruption of a Government Title may cause loss of Proficiencies on the Public Space. See, *And the Cradle Will Rock*, 3 Culture, p. 382, *supra*.

- ✓ “So the pendulum swings, now violently, now slowly; and every institution not only carries within it the seeds of its own dissolution, but prepares the way for its most hated rival.” – Dean William Ralph Inge, “Democracy and the Future,” *Atlantic Monthly*, Vol. 129, March 1922, p. 290 (available for free on Google Books).

Though Dean Inge was speaking of Western democracies, he was, of course, well aware of the demise of Roman/Classic Antiquity and polytheism, and it follows, might have also been speaking of Christianity as well. He continues:

- ✓ “The Church began by renouncing the world and ended by subjugating it. In the first century, it cursed the Babylon which sits on seven hills; a few centuries later, we find it firmly seated on the same eminence. The law of cycles, or, more accurately, of the swinging pendulum, is in fact, so generally valid, that no historian can afford to neglect it...”<sup>11</sup> *Id.*
- **The New Order:** A new Social or Estate Title may be added by activating the Order Power for that purpose when less than four undisrupted Social and/or Estate Titles are currently held. Prior to adding a new Social or Estate Title, the conditions for Legitimacy of the new Government Title must be met and there must be a sufficient space to legally place the new Title in the Public Space, in accordance with the rules governing the current Structural Title, *even if it is disrupted*. Adding a new Social or Estate Title means that a new social identity/philosophy is emerging and/or a new group is asserting its will to obtain a share of the power; in any event, the existing groups lose some power and prestige in the process.

The existing Titles and the groups they represent, despite their internal bickering, have a vested interest as a group in maintaining the *status quo*. Therefore, the chance of successfully adding a new Government Title on any turn is 100% minus 25% for each current undisrupted Social and Estate Government Title. Note that there can only be four total Estate

and/or Social Titles in each position, therefore, the minimum chance of adding a new Social or Estate Title is 25%, if the position had three undisrupted Social or Estate Titles already. The Structural Title has no effect on the process of adding a new Social or Estate Title.

- ✓ Note that, per the preceding section (*ut supra*, p. 638), adding a new Social or Estate Title will cause any *currently disrupted* Social or Estate titles to be abandoned.
  - ✓ The change of government described in these rules is not of the trivial sort that happens every few years, it's not a matter of a new executive being elected, or forming a new coalition, or a confidence vote. It is more akin to the centuries-long process where monarchies around the world were replaced by 'modern' states.
- A New Place, Old Face: Upon successfully adding a new Social or Estate Title, the Title must be immediately placed in the Public Space consistent with the Structural Title requirements, and must be done in such a way as to not cause the immediate disruption of any other Title. Thus, there must be sufficient Public Space to place the new Title, and this requires some foresight. The placement of the new Title cannot be delayed. When the Title is placed, new Pathways from the colonies may be formed if necessary, moving aside or losing items from the Public Space. New Titles are automatically legitimate on the turn they are placed ('the honeymoon'). The Concierge and players will cooperate in placement of new Titles.
- ✓ Mr. Putin, in an interview, has called the collapse of the Soviet Union, to paraphrase, 'the greatest geopolitical catastrophe of the 20<sup>th</sup> Century.' This goes far in explaining much of what has happened in the last 10 years in relation to Russia. There are, of course, many who disagree, but those who live in Russia have to keep very quiet.
- The Corridors of Power: Abandonment of an undisrupted Social or Estate Title (not to be confused with abandonment of a disrupted Title, *ut supra*) is not an automatic event, there are always those who have a vested interest in the *status quo* and when the majority of the civilization has this vested interest, and the rest are mostly silent, there is no force for change.

The chance of successfully removing a currently undisrupted Social or Estate Title is 10% plus 20% for each currently failed Conflict Check for that Title. Thus, it is easy to remove a Title that is near disruption, and difficult to remove a Title that is solidly legitimate. It is possible for players to engineer the demise of a Social or Estate Title toward removal or disruption by making moves that intentionally cause the Title to fail Conflict Checks; however, this could also harm the position and has its own cost, so it should not be assumed that positions would or should intentionally disrupt their own Titles.<sup>12</sup>

- ✓ There is a curious dynamic here; Social or Estate titles that have only one Conflict Check on the Magna Carta are easiest to disrupt, but hardest to remove voluntarily: There is a maximum 10% chance of success in voluntary removal, but if it fails the sole Conflict Check, it instantly becomes disrupted! Thus Social or Estate titles with one Conflict Check seem to represent single issue, radical, and momentarily popular movements. Single Conflict Check Social and Estate Titles are good for positions that want to keep stirring the pot during the game.
- ✓ Simon de Montfort's problem was twofold: 1) Holding the king and his relatives hostage did not grant legitimacy and 2) His parliamentary reforms – inviting lower ranking lords into parliament – were seen by his allies as diluting their power privilege.

- **Stain Removal:** When an attempt to remove a Social or Estate Title is successful, the Government Title is removed from the Public Space and abandoned (i.e. it is not disrupted and cannot be restored) at the end of the turn. As previously, this may cause loss of Pathways and the necessity of immediately forming new Pathways from colonies to the government, including movement or loss of items on the Public Space as necessary to form the Pathway.
  - ✓ “It turned out to be an unforgiving landscape – threatened by Russia, plundered by oligarchs, plagued by indecisive leaders and overrun by outsiders hoping to make a quick buck off the chaos.” – Glenn Thrush and Kenneth P. Vogel, “What Joe Biden Actually Did in Ukraine,” New York Times, November 10, 2019.
- **Perestroika Will Destroy Ya!:**<sup>13</sup> In addition to the cost of Order Power activations and forming new Pathways, adding a new or voluntarily abandoning an *undisrupted* Social or Estate Title will also assess one Intervention Potential Plus (IP+) against the position (there’s always someone who has a problem with the change).<sup>14</sup>
  - ✓ “[Kathryn Dunn] Tenpas says changes in key posts cause a domino effect, with deputies she didn’t even track in this research moving on. Tenpas argues all those staffing changes have consequences, especially ones at the top. ‘Turnover creates disruptions, it creates inefficiencies, it affects the morale. If you see people around you getting fired at a very high level, there’s a lot of angst about that,’ she says.” – Tamara Keith, “Turnover in Trump’s White House is ‘Record Setting,’ and it isn’t even close,” NPR, January 19, 2018 [citing Dr. Kathryn Dunn Tenpas, senior fellow at Brookings Institution].

---

*“There are plenty of Marxist-Leninist textbooks about taking power; but there are none about giving it up.”*

– Victor Sebestyen, Revolution 1989: The Fall of the Soviet Empire (2009)

---

**The Day I Became History:** The publication of GMT’s 2012 card-driven boardgame, 1989: Dawn of Freedom, made me feel like history.

I suddenly realized how long it had been since those events of which I still have living memory. I am part of the last cohort of the Cold War. That day, I became history; the world now belongs to the millennials and post-millennials. I have never played the game; I haven’t seen it in several years, I recall it being played maybe twice at the monthly game club.

- ✓ One of my personal memories is of watching the evening news broadcast of the U.N. relief agencies driving through Romania in early 1990 after the revolution that overthrew the government of Nicolae Ceaușescu. The convoys drove through towns, handing out soap, water, and other essentials. Mainly soap. Every house, every building – I could see the houses used to be covered in white siding – were black from industrial soot. The mud in the streets was black from industrial soot, as was the rain water. Everything was black and filthy and the captive population was living in it, the sky was dark, overcast. As I asked in *Nothing to Offer*, 1 Colleges, p. 454, *supra*, at what point does sovereignty equate to holding an entire population hostage?

And then there were the crowded orphanage nurseries ... due to the official policy promoting explosive population growth. I remember this for two reasons, the rapid

fall of the Warsaw Block and the Soviet Union was something I thought I'd see when I was 50 or 70 years old (that is, about now 2020), so the revolutions of 1989 were a very important event to me, and secondly, I was simply appalled by the images I saw and the irresponsibility in the name of ideology, ambition, and a personality cult.

**1989:** What was most amazing about the revolutions of 1989 was that they were mostly non-violent, in most cases, the police refused or delayed firing on the protesters and/or the army defected to the protesters side, no one – even those whose position, wealth, and lifestyle gave them a vested interest in maintaining *status quo* – was willing to kill to preserve an old and discredited ideology or the personality cult of a national leader. Absent police and military physical force or legitimized violence, the stand-off between the politically active part of the populace and the established government was a symmetrical conflict.

In most places, after Solidarity won in Poland – the Polish Round Table discussions served as a good model for others – the Soviet puppet regimes melted away; the process usually started with resignation of the current Communist old baldheaded, pudgy head of state, appointment of a younger, more liberal, charismatic Communist head of state, followed by the rapid collapse of the one-party system and deletion of the provision from the Constitution.

The exceptions to this were Romania where Nicolae Ceaușescu was executed along with his wife on December 25, 1989, after violent overthrow when the army went over to the protestor's side, and, of course, Yugoslavia. In Yugoslavia, which was a federation (likely, a Justice Jackson-esque 'quasi-state') and never a member of the Warsaw Pact, leaders who sought to succeed from the federation stoked ethno-nationalist sentiments (see John R. Schindler bottom feature quote, 4 Order, p. 577, *supra*) that exploded into the 1990s conflicts whose fires have been hard to put out – for example, incidents of Ultras racism at soccer games in southern Europe.

➤ Venezuela 2019: The situation in Venezuela since the death of Hugo Chavez is instructive on this point, especially the spiraling national, economic, and cultural crisis of 2017 to the present. It seems to me that as a group, the highest officials of the Maduro government (like the people in the 1953 Robert Sheckley short story "Fool's Mate") are caught in a bind: The situation is unsustainable and getting worse, it cannot go on interminably (and may end the same way as the short story: irrationally). But through their conflicting concerns, fears, loyalties, suspicions, they cannot find a non-violent way out as a group.

In April 2019, in a potential senior ministry coup to overthrow President Nicolás Maduro that failed to materialize, guarantees of amnesty were not sufficient (Anthony Faiola, "How a plot filled with intrigue and betrayal failed to oust Venezuela's president," Washington Post, May 3, 2019)<sup>15</sup> to persuade the potential plotters to denounce Maduro and the spy chief fled the country afterward. The police have refused to detain or arrest the opposition leader (the 'acting president' Juan Guaidó), but have fired on demonstrators, killing some.

Venezuela is not the first nor will it be the last, this is likely the situation (more or less, with different details) in many such cases, and thus, *'abandoned' titles are not fully sent into the night until a new title is added.* Likely, whatever happens in the Venezuela situation, "socialism" is dead as a title in that society.

- ✓ The crisis in Venezuela appears superficially similar to the situation in Poland in 1989, and that situation was resolved with the famous Poland Round Table Talks (February 6 to April 5, 1989) that encouraged ripple effect revolutions across Eastern

Europe. The parties there were cooperatively trying to defuse the situation and find a way out; no such cooperation appears in Venezuela where two men claim to be president.

- ✓ It is also likely that some of the loyalist who were in the plot were Maduro spies and that the opposition is using the media reporting of the failed coup to sow doubts among Maduro's government. Both of these possibilities can be addressed in GGDM by News Events, 2 Dreamtime, *supra*, Special Operations, *infra*, possibly even Thesis Statements, see Disputations, 2 Reformation, p. 1391, *infra*, might do the trick.

---

*“President Trump on Monday accused Democrats who did not clap during his State of the Union address of being un-American and even treasonous. His remarks came in a rambling, discursive speech at a factory in Ohio, during which he celebrated his revival of the American economy as the stock market plummeted by more than 1,000 points.”*

– Mark Landler, “Trump Accuses Democrats of ‘Treason’ Amid Market Rout,” *New York Times*, February 5, 2018

---

**Treason Everywhere:** What did he think after the 2020 SOTU...? The way in which a person uses the word ‘treason’ is indicative of their state of mind: Nicolae Ceaușescu, the leader of Romania, accused Vasile Milea, the Defense Minister, of treason because he did not order the police to fire on the protestors. Thus, in the mind of Nicolae Ceaușescu, *the protestors were the enemy of the state* (by definition of “treason”), *as if they were a foreign invading army*. When Vasile Milea committed suicide, the army believed he had been executed by the government and went over to the protestors’ side; it was over at that point for Nicolae Ceaușescu and his wife, Elena, who was also the First Deputy Prime Minister of Romania. Elena Ceaușescu would be an interesting subject for a feature biopic film; there are already some biographies published.

---

*“Plutarch says very finely, that a man should not allow himself to hate even his enemies, because, says he, if you indulge this passion in some occasions, it will rise of itself in others; if you hate your enemies, you will contract such a venomous habit of mind, as by degrees will break out upon those who are your friends, or those who are indifferent to you.*

*I might here observe how admirably this precept of morality (which derives the malignity of hatred from the passion itself, and not from its object) answers to that great rule which was dictated to the world about an hundred years before this philosopher wrote; but instead of that, I shall only take notice, with a real grief of heart, that the minds of many good men among us appear soured with party-principles, and alienated from one another in such a manner, as seems to me altogether inconsistent with the dictates either of reason or religion. Zeal for a public cause is apt to breed passions in the hearts of virtuous persons, to which the regard of their own private interest would never have betrayed them.”*

– Joseph Addison, “Mischief of Party Spirit” (1711) <sup>16</sup>

---

Endnotes.

<sup>1</sup> Citation: “I was born in Austria in 1947, shortly after the Second World War. Growing up, I was surrounded by broken men, men who came home from the war filled with shrapnel and guilt, men who were misled into a losing ideology. And I can tell you that this ghost that you idolize spent the rest of their lives living in shame. And right now, they’re resting in hell.” – Arnold Schwarzenegger, video message to Donald Trump (available on YouTube), attn: news, posted on Global News (Canada), by Chris Jancelewicz with related article and quotes, August 18, 2017.

<sup>2</sup> Citation: See also GGDM cover page regarding controlling reality.

<sup>3</sup> Citation: “I’ve been thinking more deeply about what the relationship is between Christian faith and political life. I had drawn much more of a separation between politics and faith in my past, and I need to rethink that. I certainly don’t want to do what mainstream Christianity has done and make politics indistinguishable from faith – especially on the left, and now on the right. But is there a way to talk about our nation’s issues that is not merely partisan, but raises questions of ethics and morality and ideals?” – Mark Galli, interview by Nicholas Bogel-Burroughs, “Christianity Today Editor Laments ‘Ethical Naïveté’ of Trump Backers,” *The New York Times*, January 2, 2020.

<sup>4</sup> Commentary & Citation: David Rosenhan performed a “Peanuts football trick” in a similar fashion that infuriated the mental health profession, but proved his point rather well:

- ✓ “The staff was informed that at some time during the following three months, one or more pseudopatients would attempt to be admitted into the psychiatric hospital. Each staff member was asked to rate each patient who presented himself at admissions or on the ward according to the likelihood that the patient was a pseudopatient. A 10-point scale was used, with a 1 and 2 reflecting high confidence that the patient was a pseudopatient. Judgments were obtained on 193 patients who were admitted for psychiatric treatment. All staff who had had sustained contact with or primary responsibility for the patient – attendants, nurses, psychiatrists, physicians, and psychologists – were asked to make judgments. Forty-one patients were alleged, with high confidence, to be pseudopatients by at least one member of the staff. Twenty-three were considered suspect by at least one psychiatrist. Nineteen were suspected by one psychiatrist and one other staff member. Actually, no genuine pseudopatient (at least from my group) presented himself during this period. The experiment is instructive. It indicates that the tendency to designate sane people as insane can be reversed when the stakes (in this case, prestige and diagnostic acumen) are high. But what can be said of the 19 people who were suspected of being ‘sane’ by one psychiatrist and another staff member? Were these people truly ‘sane’ or was it rather the case that in the course of avoiding the Type 2 error the staff tended to make more errors of the first sort – calling the crazy ‘sane’? There is no way of knowing. But one thing is certain: any diagnostic process that lends itself too readily to massive errors of this sort cannot be a very reliable one.” – David L. Rosenhan, “On Being Sane in Insane Places,” *Science*, Vol. 179 (Jan. 1973), pp. 250-258.

<sup>5</sup> Commentary: The people of Russia had a rare opportunity for self-determination, but allowed themselves to be bamboozled that ‘democracy’ was dangerous and chaos (the similar argument that the Soviets used) and that managed democracy (muzzled Caucasian Shepard Dog style) led by a bitter ex-KGB officer – another word for autocracy as it turned out – was better. The choices they have made will be inherited by their children. And humanity.

<sup>6</sup> Commentary: I believe that my entire 4th grade class watched the 1971 British movie *Nicholas and Alexandria* on a big screen at a small art association theatre across the street from my elementary school. It may have been split into two afternoons. I was interested in the movie (I didn’t get to watch many movies at that time), probably more interested than my classmates, but I also recall having difficulty staying awake.

<sup>7</sup> Citation: The Wikipedia article, “Social War (91–88 BC)” notes: “By the 2nd century BC the Italian allies contributed between one half and two-thirds of the soldiers in Roman armies. Rome also had virtual control over the allies’ foreign policy, including their interaction with one another. Aside from the Second Punic War, where Hannibal had limited success in turning some Italian communities against Rome, for the most part the Italian communities were content to remain as client states of Rome in return for local autonomy. The Romans’ policy of land distribution had led to great inequality of land-ownership and wealth. This led to the ‘Italic people declining little by little into pauperism and paucity of numbers without any hope of remedy.’ A number of political proposals had attempted to address the growing discrepancy whereby Italians made a significant contribution to Rome’s military force, while receiving disproportionately small shares of land and citizenship rights.”

- ✓ Captured October 17, 2018, quoting Greek-Roman historian Appian of Alexandria (95-165 A.D.) from his book, *Civil Wars*. As his copyright has expired, © his works are available online in various places.

<sup>8</sup> Citation: “Zambelli, if you start outmaneuvering yourself to no purpose, we’ll be here all night.” – Pope Alexander III, Becket (1964).

<sup>9</sup> **Commentary:** This anthem will always have a special meaning to those who remember the Cold War and the summer of 1989. It seems most fitting that it was written by a West German band after they performed at the Moscow Peace Festival, August 12 and 13, 1989 and during the summer of the German Unification (October 1990).

<sup>10</sup> **Citation & Commentary:** “Rouhani, 69, suggested there was a generational element to the unrest, which appears to have been spearheaded by under-25s. ‘We cannot pick a lifestyle and tell two generations after us to live like that. It is impossible... The views of the young generation about life and the world is different than ours,’ he said.” – Bozorgmehr Sharafedin, “In a jab at rivals, Rouhani says Iran protest about more than the economy,” Reuters News Agency, January 8, 2018.

- ✓ In the subtext of this statement, Rouhani was also perhaps criticizing Wahhabism and the colossal tragic absurdity that the Islamic State forcibly inflicted upon Islam.
- ✓ “But the nuclear deal didn’t provide the ... regime with the means or motivation to expand its regional aggression. The government is overextended, which has taken a toll on average [Citizens], and is now animating the demonstrations. There’s a lot going on in the country that has nothing to do with the nuclear deal, including the desire of many [Citizens] for a modern state and a government that isn’t corrupt, oppressive or preoccupied with meddling in the affairs of its neighbors.” – Y.J. Fischer, formerly of the US State Dept., Washington Post, January 4, 2018.

<sup>11</sup> **Commentary:** And there the quote must end, because what follows is both irrelevant and disagreeable. This is the tricky part of quoting others; Dean Inge was a good mind, and an eloquent writer – of his time – and while I respect his opinions *in his time*, I very much disagree with some of his subsequent assertions; he and I are of different eras, different opinions. If you want to see what he said beyond the end of the quote, it’s free to read on Google Books.

- ✓ Probably someone else may do the same to me someday. Perhaps this is what we call a topical truth function? We all cherry-pick; after thoughts have been chewed over and over by succeeding generations of writers and thinkers, what remains is the rough pit of thoughts that might be regarded as human truths.
- ✓ See the Inge Process, 5 Diplomacy, p. 1161, *infra*.

<sup>12</sup> **Citation:** “First, having played Zarek for the past four years I would like to say that never did I play this character as a villain nor did I think he was one and I still feel that way. After paying the price of 25 years in prison for standing up for human rights and seeing both his family, friends and cohorts killed by a suppressive government on his home planet he had every right to distrust the powers that be on Galactica that seemed to think that only they had the right to make decisions for the people. And since Zarek was blocked illegally by Roslin and Adama at every turn including from winning a fair election he had to resort to any leverage he could gain to assert some kind of voice in what had become an almost dictatorial government run by Adama and Roslin, who looked with disdain upon the council of the 12 and did pretty much what they wanted without consensus of the people....

Did everyone forgot what democracy is about or do we just shut our eyes when the government no longer listens to the democratically elected representatives of the people just because we love the characters. And by the way I love both these actors and the character they play too the fact is they broke as many laws as they claim Zarek did. The truth is from everything I’ve read and from all the scripts I played it was clear to me that Zarek’s actions were always about making a positive difference which is what his whole life was about. My god he paid with 25 years in prison for it and with his life....

The government of Adama and Roslin as much as we love these character broke every constitutional rule or law to stay in power and to assert their will, regardless of their positive motivations they had destroyed a true democracy on the Galactica and yet Zarek is looked upon as the power hungry bad guy because he was one of the few to stand up and challenge them.... In truth Zarek, Adama and Roslin all wanted power for the same reason, to make a positive difference but Zarek still idealistically believed that the government should always be accountable to the people represented in this show by the council of the 12.” – Richard Hatch comments (authenticated by the blogger) reprinted in “Richard Hatch speaks out about Battlestar Galactica’s Tom Zarek,” February 9, 2009, found at: [http://featuresblogs.chicagotribune.com/entertainment\\_tv/2009/02/battlestar-galactica-tom-zarek-richard-hatch.html](http://featuresblogs.chicagotribune.com/entertainment_tv/2009/02/battlestar-galactica-tom-zarek-richard-hatch.html).

<sup>13</sup> **Citation:** Historical irony in translation: “Paranoia, they destroy ya!” – The Kinks, “Destroyer” (1981) often misheard as, “Paranoia will destroy ya!” (which works just as well) because of the way it is sung.

<sup>14</sup> **Citation:** Dr. Paul T. Mason, Jr., Duquesne University Dept. of History: ‘When there is going to be violence, when violence is certain, the side that controls when and where it occurs has the advantage,’ part of a lecture about partisan riots in Paris during the French Revolution and the Reign of Terror.

*“The problem with that approach, of course, is that being against what the last guy did isn’t a proactive set of policy solutions. Unlike in a campaign – in which saying, essentially, ‘I’ll do the opposite of what the last guy did’ – where running against something often works better than running for something, governing is a very different animal.”*

– Chris Cillizza, CNN Editor at Large, October 13, 2017

*“Mr. Renzi, speaking in the Senate, argued that while populism works well on the campaign trail, ‘it works less good when we are dealing with governing.’ ... Mr. Renzi spent the past few years vowing never to join forces with Five Star, accusing it of spreading hate, misinformation and a dangerous anti-expertise ethos.”*

– Jason Horowitz, “Italy’s Government Collapses, Turning Chaos Into Crisis,” New York Times, August 20, 2019

**Populism a priori:** Thus, what Mr. Callizza pointed out in 2017 (*ut supra*) is not *novel*, but rather a long-standing generalization, possibly also a synthetic *a priori* proposition of political science, probably since the first polis, of which we have needed reminder in the last decade on both sides of the Atlantic. That is, a deductive principle from reflection, to which there are probably no historical incidents to refute its universal validity. Oddly, Five Star Movement is described in the article as Italy’s “anti-establishment” party but was part of the governing coalition with “the hard-right, anti-migrant League.”

✓ See also Tom Nichols, The Campaign Against Expertise excerpt, Colleges, *supra*.

*“While candidates make great efforts to project positive images to the public, it appears to be campaign gaffes that attract voters’ attention. This is consistent with psychological research which suggests that negative information is weighted more heavily than positive information when impressions of others are formed: negative items appear to have a stronger ‘pull’ on overall impressions. Such a tendency is known as the negativity effect....*

*Negativity also characterizes political judgments. In an analysis of the 1968, 1972, and 1980 National Election Studies (NES), Lau (1982, 1985) found that reasons offered by respondents for disliking a candidate were more predictive of overall evaluations than were reasons for liking a candidate. The 1984, 1988 and 1992 NES surveys each included a trait inventory of positively-worded attributes, and respondents were asked how well each attribute described the candidate. Thus, respondents could indicate a perceived character strength by saying that the trait was descriptive of the candidate, or they could indicate a perceived weakness by saying that the trait was not descriptive of the candidate.... Perceived candidate weaknesses were found to be more predictive of overall evaluations and voting than were perceived strengths.”*

– Jill Gabrielle Klein, abstract of “Negativity in Intradimensional Judgments of Presidential Candidates,” *Advances in Consumer Research* Volume 25, 1998, pp. 574-577 <sup>1</sup>

**Condemnation Notice:** Structural Government Titles do not have Conflict Checks, but they may still be disrupted by other means, though it should happen very rarely. As stated previously, a Structural Title can only be disrupted: if the position does not currently have a Capital Colony (**after** a position’s Capital Colony has been established, see Capital Colony, 2 Order, p. 532, *supra*), if the position has no remaining undisrupted Social or Estate Titles, or if the position is unable to comply with the requirements of the Structural Title for any reason, including but not limited to, having no undisrupted Social or Estate Titles to connect the colonies by Pathways, see World Powers Fall, 3 Government Titles, p. 617, *supra*.

- ✓ “Since the fall of the Republic, the authority of the Roman Senate had largely eroded under the quasi-monarchical system of government established by Augustus, known as the Principate. The Principate allowed the existence of a *de facto* dictatorial regime, while maintaining the formal framework of the Roman Republic. Most Emperors upheld the public facade of democracy, and in return the Senate implicitly acknowledged the Emperor’s status as a *de facto* monarch. Some rulers handled this arrangement with less subtlety than others.” – from Wikipedia article, “Domitian,” captured December 31, 2019.
  - “All states, all powers, that have held and hold rule over men have been and are either republics or principalities.” – opening lines to The Prince by Machiavelli (1513), translated by W.K. Marriott.
  - Julius Caesar was assassinated because the plotters feared he was making himself *Rex* (‘king’); his nephew and adopted heir, Gaius Octavius as Emperor Augustus, finished the process. The third party to the story was the Praetorian Guard (*ut infra*, p. 653).
  - “After the demise of the Second Triumvirate, Augustus restored the outward façade of the free Republic, with governmental power vested in the Roman Senate, the executive magistrates, and the legislative assemblies. In reality, however, he retained his autocratic power over the Republic. By law, Augustus held a collection of powers granted to him for life by the Senate, including supreme military command, and those of tribune and censor. It took several years for Augustus to develop the framework within which a formally republican state could be led under his sole rule. He rejected monarchical titles, and instead called himself *Princeps Civitatis* (‘First Citizen’). The resulting constitutional framework became known as the Principate, the first phase of the Roman Empire.” – from Wikipedia article, “Augustus,” captured January 3, 2020.
- ✓ Independence Day 2021 is the 245<sup>th</sup> ‘birthday’ of the United States of America and both sides of the political aisle admit that we have already drifted far from the original republic in only about half the time it took for the Roman Republic to evolve (progress, transition, or deteriorate if that is your view) into the Roman Empire. Where will the United States be in two centuries? Are we on the well-traveled path?
- Extreme Makeover: Changing a Structural Title is an extreme measure. Because a position may only have one Structural Title at a time, and cannot be without a Structural Title (whether or not disrupted), a position cannot remove or add a Structural Title as it would other Titles (see, A New Order and Corridors of Power, 5 Government Titles, both p. 642,

*supra*); rather it can only change Structural Titles by doing both at the same time with one activation of the Order Power for the purpose of Government Formation. A moderate change, which would be any change from a Unitary or Confederation Title to a Dualistic Title and *vice versa*, has a 20% chance of success. A radical move from a Unitary to a Confederation Title, and vice versa, has a 10% chance of success. The chance of success is increased by 20% if the Structural Title is currently disrupted.

- ✓ “Though her vision energized many liberals – the unlikely chant of ‘big, structural change’ rang out at her rallies – it did not find a wide enough audience among the party’s working-class and diverse base.” – Shane Goldmacher and Astead W. Henson, “Elizabeth Warren, Once a Front-Runner, Drops Out of Presidential Race,” New York Times, March 5, 2020.
- Thirty Tyrants: A disrupted Structural Title is the most awful tyrant; it continues to exert structural control, but is powerless and wobbly.<sup>2</sup> Changing Structural Titles is probably more painful and costly than taking steps to restore the current Structural Title. It will be interesting to see under what circumstances and for what reasons a position would make this change during the course of the game. But we know it has happened historically and such moves are usually monumental; commonly cited examples would include the collapse of European monarchies to be replaced by dualistic republics, and the transition from the Articles of Confederation to the Constitutional Republic in the fledgling United States (from which there has been considerable drift). What events would be required for the United States to return to a Confederation, or more likely, become a dictatorship?
  - ✓ History provides plenty of examples. The pattern for movement from ‘confederation’ or scattered vaguely allied sovereigns to central authority is usually conquest. But there are historical cycles in motion and the history of central and western Europe from the 4<sup>th</sup> Century to the 11<sup>th</sup> Century shows the process of fragmentation of authority due to raids, invasions, division, and the preeminence of defense over offense.
- Home-Wreckers: A change in Structural Title requires a rearrangement of the existing undisrupted Titles. Upon a successful change in Structural Title, the Concierge will rearrange the position’s Titles so that they are legally placed according to the new Structural Title, old Pathways may be dissolved and/or new ones formed.

This may/will require considerable rearrangement with possible losses of Cultural Traits, Fuzzy Groups, and other game items on the Public Space. Colonies will not be lost, but they can be moved out of the way to another place in the Public Space, but anything not representing population (such as Culture and Research) may simply be removed if necessary.

---

*“Hindenburg told me he would serve another term as president, but the office must be laid in his hands as an accomplished fact, because he is not inclined or in a position to undertake a new election campaign.”*

– Heinrich Brüning, German chancellor in early 1932

\*\*\*

---

*“A presidential cabinet led by Hitler would develop into a party dictatorship, with all its consequences for an extreme aggravation of the conflicts within the German people.”*

– President Paul von Hindenburg, November 1932

\*\*\*

*“Gentlemen, I hope you will not hold me capable of appointing this Austrian corporal to be Reich Chancellor.”*

– President Paul von Hindenburg, January 1933 <sup>3</sup>

**In the Hall of Mirrors:** In 1871, *delegates from the parliament of Northern Germany* petitioned Wilhelm I, King of Prussia, to declare himself Emperor of Germany, which was accomplished in the Hall of Mirrors in Versailles after the French surrender to end the Franco-Prussian War. Prior to becoming the German Empire, Germany was a complex federation of states bound by agreements, nationalism and economic ties, from the end of the Napoleonic Era and the dissolution of the Holy Roman Empire.

Five centuries of nearly endless strife, invasion and plague had constantly displaced and mixed the German populations (Saxons, Bavarians, Prussians, Rhinelanders, East Prussians, Hessians, Silesians) thoroughly such that they emerged into the 19<sup>th</sup> century with a homogeneous cultural and national identity.

- ✓ “In the late 20<sup>th</sup> century, many social scientists argued that there were two types of nations, the civic nation of which France was the principal example and the ethnic nation exemplified by the German peoples.” – from Wikipedia article, “Nation,” captured November 1, 2018.

In 1933, *the Reichstag effectively voted itself out of existence by passing the Enabling Act* that allowed the government to pass laws without the Reichstag.

- ✓ “The Enabling Act of 1933 was renewed by a purely Nazi Reichstag in 1937 and 1939. In 1941 and 1943 it was renewed by decree, in 1943 without temporal limit. Although it states that it is valid only for the duration of the current Hitler government of 1933, it remained in force even after major changes of ministers. In any case, Hitler called the cabinet together only very rarely after the first months of 1933. The last cabinet meeting happened in 1937. He preferred to govern via decrees and personal orders.” – from Wikipedia article, “Enabling Act,” September 28, 2018.

On August 1, 1934, the day before President Hindenburg died, Chancellor Adolf Hitler with his cabinet, passed a decree that upon the death of President Hindenburg, the office of the President would be merged with the Chancellor into a single office, *Führer und Reichskanzler*. This, along with the Reichstag Fire Decree, issued by President Hindenburg in February 1933 at the recommendation of Chancellor Adolf Hitler, made Adolf Hitler the *legal dictator* of Germany as *Führer und Reichskanzler* with an impotent Reichstag and the government controlled by his party.<sup>4</sup> The German people approved of the merger in a referendum on August 19, 1934, in which 90% of the votes were ‘yes’ votes (95% of voters voted).

- ✓ President Hindenburg does not come out of this situation smelling of roses, Hitler appears to have played him for a chump. Hindenburg is blamed at least for his part in

the rise of Adolf Hitler (though there certainly were circumstances beyond his control), and it is clear that he miscalculated, his military ‘genius’ did not translate to politics (not an unusual occurrence in history). The discussion for the last 80 years has been about figuring out how all of this happened, and where mistakes were made, for example, I remember my mother saying to me when I was young, “They put Hitler in power because they thought they could control him.”

*“It has been the experience of history that large forces of ‘household troops’ are maintained at any nation’s peril, and Rome’s Praetorian Guard was no exception. Established on a moderate scale by Augustus, these cohorts had grown into an army of 50,000 which made and broke emperors at pleasure, even to the extent of auctioning off the purple to the highest bidder. The pay and privileges of the Praetorians set an example of insolence which spread until it corrupted the fighting men on the frontier.”*

– Lynn Montross, *War Through the Ages* (3<sup>rd</sup> Ed., 1960), pp. 87-88

**Household Troops:** The *praetorians* were originally personal bodyguards of various Roman generals; the *praetorians* of various generals grew in size, forming an elite, last reserve unit to be committed to battle at the decisive moment. When Octavian defeated Anthony in 30 B.C., his large *praetorian* became the famous Praetorian Guard permanently housed in Rome.

In 23 A.D., *Casta Praetoria*, a permanent high walled, fortified barracks, was constructed for the Guard in the north east corner of Rome (opposite and across the river from Vatican). Possession of a major fortification just outside the central areas of Rome was a turning point in the power ascent of the Guard, making them nearly unassailable in Rome. *The Emperor ruled the Empire from Rome, the Guard ruled Rome.* To be proclaimed Emperor, one had to come to and live in Rome. It was thus that from 30 B.C. to 68 A.D., Roman emperors of the Claudio-Julian Dynasty maintained a separate personal guard unit, the *cohors Germanorum*, recruited from the German border tribes along the Rhine, and considered politically neutral. When the *cohors Germanorum* was dissolved in 68 A.D., the Praetorian Guard was the sole force in Rome.

➤ **Impertinence of Pertinax:** One hundred twenty-five years later, on **March 28, 193 A.D.**, the Emperor Pertinax was killed by the Praetorian Guard after he revoked their privileges and reduced the pay of the troops. The Praetorian Guard then determined to – literally – auction off the crown to the highest bidder. Titus Flavius Claudius Sulpicianus, the father-in-law of Emperor Pertinax, inside the walls of *Castra Praetoria* with the guard, began the bidding. A wealthy man, Didius Julianus, arrived outside the gates of *Castra Praetoria* and began bidding against his rival, both bidders shouting out bids to the soldiers on the wall. Didius Julianus won the bidding, was declared Caesar by the Praetorian Guard, for promising to pay each soldier 25,000 sesterces, and the Senate, under threat of the Guard, confirmed Didius Julianus as the new Emperor. Subsequently, Septimius Severus, in command of three legions in Pannonia (and closest to Rome), marched to Rome, defeated the Praetorian Guard forces sent to stop him, and reached Rome. The decadent Guard surrendered, the Senate proclaimed Severus as Emperor, sentenced Julianus to death: He was killed on **June 1, 193 A.D.**<sup>5</sup>

✓ Despite the Praetorian Guard example, the practice continued well into the Byzantine Empire. The Varangian Guard, deliberately composed only of distant foreigners, was an elite unit and the personal bodyguard of the Emperor who led the second attack on the Pecheneg wagon lager at the Battle of Beroia in 1122 A.D., using Dane axes to

hack through the defenses. In the last two centuries of the decline, the Guard was dominated by locals, lost status and faded away between 1350 and 1400 A.D.

- On Being Roman: A ripple effect of the payment of bribes by pretenders and newly-appointed Emperors to secure the loyalty of not only the Praetorian Guard in Rome, but also frontier legions, and various officials, wealthy families, and senators, was the devaluation of Roman currency over centuries. Bribes were not often paid from the personal fortunes of the new Emperors, nay, they were paid out of the Roman treasury in the form of coins. Over time, as sources of silver petered out at an accelerated rate due to increased production demands and territorial losses, the silver purity of Roman coins decreased substantially so that more coins could be minted with less silver, allowing large amounts of coins to be minted in short time periods to pay the bribes, lest the troops become unruly. This then decreased the wealth prestige of Rome, making external trade more difficult.

- ✓ “When introduced, the denarius contained nearly pure silver at a theoretical weight of approximately 4.5 grams, but from the time of Nero onwards the tendency was nearly always for its purity to be decreased. ... The denarius continued to decline slowly in purity, with a notable reduction instituted by *Septimius Severus*. ... This was followed by the introduction of a double denarius piece... The coin is commonly called the antoninianus by numismatists.... Although nominally valued at two denarii, the antoninianus never contained more than 1.6 times the amount of silver of the denarius. The profit of minting a coin valued at two denarii, but weighing only about one and a half times as much is obvious; the reaction to these coins by the public is unknown.”  
– from Wikipedia article, “Roman currency,” April 21, 2020 (emphasis added).

The 1984 board game, *Conquest of the Empire*, was innovative for its crude attempt to introduce the effects of Roman inflation due to civil wars. Similarly, the Seven Years War forced Prussia to revalue the Thaler through the Mint Act of 1763 to bring it into line with the depreciated coins circulating in the economy and to lower inflation; this began a ripple effect of currency reform through Europe as other nations also revalued, devalued, or debased their own currencies. Although GGDM does not operate on a monetary economy, participants may imagine that such exists within position’s civilizations and apply these effects.

---

*“That’s one of our speculations, by the way. That the prior version of history that this one overwrote was horrible. Complete geopolitical mayhem; half of New York City is underwater. The United States is headed toward civil war, or ruled by an artificial-intelligence construct, or some such other thing. Real end-of-days stuff. That the instances of ourselves who existed in that history figured out what we have: that the invention of the causality violation device was the cause. That in that prior version of history, Rebecca did not die in a car accident. That she went back to the past on a mission, as a volunteer, well aware of her sacrifice.”*

– Dexter Palmer, [Version Control](#) (2016)

---

**Alternating History**: It seems silly to say, but in order for there to be an alternate history, the observer must remember another version of history and consider that version ‘real.’ Perhaps an ‘eigenstate’ of memory. Without that belief and memory, history is not alternate. As to whether history is ‘real,’ see *Five Types of Facts*, 1 Dreamtime, pp. 135-137, *supra*.

- ✓ When I saw the ending of the movie *Gladiator* (2000), I immediately said, ‘that’s not what happened!’ History records as ‘facts’ that Commodus reigned for 15 years of increasing megalomaniac insanity, he renamed Rome as *Colonia Lucia Annia Commodiana* after the fire of 191, renamed the months of the year after himself, renamed the Senate, renamed the fleet, and renamed the Roman Legions too. He was poisoned by his mistress, then strangled by his wrestling partner when the first didn’t work. He died on New Years Eve 192 A.D. As soon as he died, most of his acts were shortly undone, Rome was restored to its original name, and he was declared a public enemy by the Senate. The Year of the Five Emperors followed (193 A.D.), *ut supra*. I later watched an interview with the director of *Gladiator* who quipped, “Well, I never let a little history get in the way of a good story!” Yeah, really?

**The Year of the Five Presidents:** The year 193 A.D. is known as The Year of the Five Emperors in the history of the Roman Empire, 1,782 years later, the year 1975 A.D. is the Year of the Five Presidents of the United States of America. Since you may not remember 1975, allow me to recount it for you here.

On January 9, 1975, the embattled President, Richard Nixon (R-CA), resigned as President of the United States, and was succeeded by Vice President Gerald Ford (R-MI) who had earlier succeeded Vice President Spiro Agnew who resigned under charges of bribery and money laundering. President Ford nominated Nelson Rockefeller (R-NY) to the Vice Presidency, which was confirmed after lengthy and embarrassing Congressional hearings.

September 5, 1975, President Ford was assassinated by Lynnette “Squeaky” Fromme, a follower of Charles Manson, in front of the State House in Sacramento, California. Immediately afterward, Nelson Rockefeller was sworn in as President of the United States and nominated Speaker of the House, Carl Albert (D-OK), to the Vice Presidency, which – following initial political shock of a party ceding the Vice Presidency, a return to the original Constitutional roots – was quickly confirmed by a bipartisan Congressional majority, in part to show political solidarity and in part to avoid further instability and embarrassment to the United States.

Sarah Jane Moore assassinated President Rockefeller in front of the St. Francis Hotel in San Francisco, California on September 22, 1975. President Rockefeller served for just 16 days. Upon taking office, newly sworn President Carl Albert took a week to consider the situation and the sense of panic gripping the country, and – despite calls for a Republican Vice President, emerged with a nomination of the nationally unknown Democratic former Governor of Georgia, Jimmy Carter (D-GA) of the “New South,” as his Vice President. Initially shocked by the nomination, the media and Congress came to see the wisdom of the choice and hastily confirmed the nomination of Jimmy Carter for Vice President.

Francisco Franco, the dictator of Spain died on November 19, 1975. President Albert attended the funeral of Franco, but mysteriously disappeared without trace during the event; his body was never found. How could that happen? While an intense investigation followed the frantic manhunt and international crisis, after 10 days missing, Congress declared that President Albert was presumed dead or unable to discharge his duties, and as such, on November 30, 1975, Vice President Jimmy Carter was sworn in as President of the United States, exactly 193 years after the initial agreement leading to the Treaty of Paris was signed, on November 30, 1782.

Three weeks later, the *Washington Post* and the *New York Times* jointly exposed the Secret Service “Praetorian Guard Plot.”

- ✓ Although critics later commented on the misappropriation of the term Praetorian Guard as the name of the plot – chafing at the false comparison between the Secret Service and the ancient guard, the essence of the plot struck a newsroom editor as being Praetorian in nature and the term became the headline.
- The POTUS Not: The Vice Presidency of the United States is the most curious position and the weakness of our system. The problem is that the current vision of the Vice Presidency amounts to little or nothing but a ‘president in waiting.’ No one during an election ever asks or considers how the Vice President will handle his duties as the President of the Senate or to what extent the VP will be involved in the day to day activities of the Senate. Perhaps forgetting their civic lessons, the electorate and media mainly considers the ‘running mate’ in terms of political coalition building during the election cycle, and as the first in succession to the Presidency in case of death or disability. Recent experience shows that the main job of the Vice President is to be quiet, to sometimes act as the mouthpiece and faithful defender of the President, to go on some foreign trips, and other times, to disappear smiling, like a certain famous cat, rather than disagree publically with the President.
- ✓ An example is the ‘shoot down order by’ Vice President Dick Cheney during the 9/11 attacks. The Commission report, as summarized by the Washington Post,<sup>6</sup> indicates that there is no documentary record of a phone call from President Bush in Florida to Vice President Cheney authorizing U.S. fighter jets to shoot down civilian aircraft after the initial attacks, however, the record is incomplete.<sup>7</sup> The Vice President of the United States is not the ‘vice commander in chief’ of the armed forces,<sup>8</sup> he is not in the chain of command, unless the President is disabled or unable to communicate.<sup>9</sup>

This was not the case on 9/11, as President Bush did have several phone calls with the Vice President in the bunker and other high ranking military and civilian officials. Further, Chaney made erroneous comments to Secretary of Defense Donald Rumsfeld located at the Pentagon, when relaying the alleged authority and order to shoot (Rumsfeld had a more accurate understanding of the situation than Cheney); in fact, the fighters from Langley AFB had not been ordered to shoot down aircraft over Washington, D.C. and no aircraft had been shot down anywhere over the U.S. Cheney’s order to shoot was finally relayed to the commander at Andrews AFB while those fighters scrambled, by a Secret Service Agent (a person not in the chain of command) who said it came from VP Cheney – who was not in the chain of command.

- See also discussion of President Eisenhower’s pre-delegation of nuclear authority, 4 Combat, EN 23, p. 1004, *infra*.

---

*“It is the nature of ambition to make men liars and cheats, to hide the truth in their breasts, and show, like jugglers, another thing in their mouths, to cut all friendships and enmities to the measure of their own interest, and to make a good countenance without the help of good will.”*

– Gaius Sallustius Crispus aka Sallust (86-35 B.C.)

---

**Bitterness & Murder:** Like Aristotle's definition of time, and select other ancient writers on various human subjects, Sallust in his bitterness, stated the point so perfectly that it has become axiomatic. Sallust, a Senator, opponent of Cicero and supporter of Julius Caesar, and not exactly a moral man himself (by our standards, but probably was by Roman standards), spoke from personal experience. Such *dictum magna* can be spun, expanded and expounded upon, but not bettered. Everyone in every time and place of human history would grasp the applicability of these sorts of statements to their own times and pass them on to the next era.

Sallust's opponent, the better known Cicero, though not involved in the plot to assassinate Julius Caesar, nevertheless, subsequently expressed joy at the political lynch mob murder on the Senate floor, and failed to be appalled or repulsed by *political murder* (the surest sign that the Republic was dying). And rather than repudiate the process that made them masters of Rome, Mark Anthony and Augustus used Caesar's murder as pretext to embrace political murder for vengeance and to eliminate their opponents by reinstating public proscription. Cicero subsequently was killed by two Roman soldiers on orders from the Second Triumvirate and specifically, Mark Anthony, while being carried on a litter from his house and his head and hands cut off and displayed in Rome. See additional discussion, Equilibrium Epiphany, 1 Kairotic Moments, p. 1421, *infra*.

- ✓ Rome is the epitome of why political murder cannot be allowed to take over a civilization (however, the world has an endless litany of examples). Those who may have the ability to solve problems in new ways gain some popularity and then are killed in the ambitious tussle for power. Many Roman and later Byzantine politicians were killed in the streets by 'mob attacks' or during rioting, one of which took the life of St. Augustine's friend inspiring him to convert to Christianity (that's the story I heard in rhetorical theory class or perhaps read) and later, early Christianity adopted the mob agitation and riot mentality, e.g., Hypatia of Alexandria was seized and killed by a Christian 'mob' in the streets when Christians sought to take over Alexandria. Thus the late Roman Empire mob political murder and violence ironically became the tool of local Christian ascension. Nations such as Germany and Russia have feasted on themselves in a frenzy of political murder; once it is fully unleashed, the process also turns on those who are not a threat to the leadership or to the state, but who simply disagree (e.g., the White Rose group and most of the victims of Stalin).
- ✓ Political murder, as we know from history, subsequently became the normal day in the Roman Empire. But it is an odd thing. The conspirators of the July 20 Plot in 1944 are celebrated (with some reluctance, e.g., von Stauffenberg, a *loyal army officer*, had served in the Poland, France, the Eastern Front, and North African campaigns and had been promoted, awarded and compensated) as heroes who tried to stop a madman, and this is the way that Caesar's assassins may have been regarded for a short while in 44 B.C. So sometimes it appears that political murder is condoned when it is generally appreciated *that no other option remained*, as in the Nazi dictatorship of Germany leading down the road to the ultimate national disaster. It also appears generally a rule of history *that would-be assassins and conspirators are more celebrated for trying when they fail than when they succeed* (e.g., John Wilkes Booth and the assassins of Julius Caesar), probably because they didn't actually kill their target – noting however, that four people – but not Hitler – were killed by the assassination bomb on July 20, 1944 and 20 more were injured. The July 20 plotters in fact, implicitly, intended to kill everyone in the room, but the meeting was moved.

While Sallust's works are mainly plays and a history of interest to scholars, Cicero is much better known because he was sanctioned by the early Church as a 'righteous pagan' (despite his failure to condemn political murder in the Senate) and his works were copied and preserved through the Middle Ages.

- ✓ In GGDM play, while individual characters are not encouraged, late Rome provides many \*bad\* examples that can be creatively used for Interventions by the Concierge if it fits the story and the target position. So while individual characters may not be assassinated or murdered for political purposes, it is possible for positions (unless they are angelic) to go through periods of time, perhaps represented by a chaotic Regular Turn, of political murder with all of its consequences expressed in an Intervention or two.

#### Endnotes.

<sup>1</sup> Commentary & Citation: The executive summary version from Wikipedia: “The presumption that negative information has greater diagnostic accuracy is also evident in voting patterns. Voting behaviors have been shown to be more affected or motivated by negative information than positive: people tend to be more motivated to vote against a candidate because of negative information than they are to vote for a candidate because of positive information. As noted by researcher Jill Klein, ‘character weaknesses were more important than strengths in determining...the ultimate vote’” – from Wikipedia article, “Negativity Bias,” captured April 16, 2018 citing to Jill Gabrielle Klein (1998), “Negativity in Intradimensional Judgments of Presidential Candidates,” in NA – Advances in Consumer Research Volume 25.

<sup>2</sup> Commentary & Citation: A similar example, “Although Elphinstone was a man of high birth and perfect manners, his colleague and contemporary General William Nott regarded him as ‘the most incompetent soldier who ever became general’ ... By the fourth day, a few hundred native soldiers deserted and tried to return to Kabul but they were all either killed or enslaved. By now Elphinstone, who had ceased giving orders, sat silently on his horse ... The leadership of Elphinstone is seen as a notorious example of how the ineptitude and indecisiveness of a senior officer could compromise the morale and effectiveness of a whole army (though already much depleted). Elphinstone completely failed to lead his soldiers, *but fatally exerted enough authority to prevent any of his officers from exercising proper command in his place.*” – from Wikipedia article, “1842 retreat from Kabul” (aka the Massacre of Elphinstone’s Army), captured October 16, 2018 (emphasis added).

- ✓ Gen. Elphinstone was 60 years old in 1842 and had been in the British army for 38 years. Though I am closer to 60 than I want to admit, people age at different rates, and if not senile, Elphinstone might best be described as an ill dotard in a waistcoat and epaulettes. See previous discussion of 19<sup>th</sup> Century European post-Napoleonic leadership in Interdisciplinary Approach, 4 Colleges, p. 507, *supra*.

<sup>3</sup> Citation: Unsourced quotes found on Alpha History website.

<sup>4</sup> Commentary & Citation: The daily reality of dictatorship: “The Gestapo had the authority to arrest citizens on the suspicion that they *might* commit a crime, *and the definition of a crime was at their discretion.* The Gestapo Law, passed in 1936, gave police the right to act extra-legally. This led to the sweeping use of Schutzhaft – ‘protective custody,’ a euphemism for the power to imprison people without judicial proceedings.” – Wikipedia article, “Reinhard Heydrich,” citing to Chris McNab, The SS: 1923–1945 (2009), captured September 27, 2018 (emphasis added).

- ✓ Rinse & Repeat: “In September 1970, the [Somali] government introduced the National Security Law No. 54, which granted the NSS [National Security Service] the power to arrest and detain indefinitely those

who expressed critical views of the government, without ever being brought to trial. It further gave the NSS the power to arrest without a warrant anyone suspected of a crime involving ‘national security.’ Article 1 of the law prohibited ‘acts against the independence, unity or security of the State,’ and capital punishment was mandatory for anyone convicted of such acts. From the late 1970s, and onwards Barre faced a shrinking popularity and increased domestic resistance. In response, Barre’s elite unit, the Red Berets (*Duub Cas*), and the paramilitary unit called the Victory Pioneers carried out systematic terror against the Majeerteen, Hawiye, and Isaaq clans. The Red Berets systematically smashed water reservoirs to deny water to the Majeerteen and Isaaq clans and their herds. More than 2,000 members of the Majeerteen clan died of thirst, and an estimated 5,000 Isaaq were killed by the government. Members of the Victory Pioneers also raped large numbers of Majeerteen and Isaaq women, and more than 300,000 Isaaq members fled to Ethiopia. By the mid-1980s, more resistance movements supported by Ethiopia’s communist Derg administration had sprung up across the country. Barre responded by ordering punitive measures against those he perceived as locally supporting the guerillas, especially in the northern regions. The clampdown included bombing of cities, with the northwestern administrative center of Hargeisa, a Somali National Movement (SNM) stronghold, among the targeted areas in 1988. The bombardment was led by General Mohammed Said Hersi Morgan, Barre’s son-in-law, and resulted in the deaths of 50,000 people in the north.” – from Wikipedia article, “Siad Barre,” captured October 12, 2018.

<sup>5</sup> Commentary: Sometimes people in the past did things that are so contrary to our current worldview as to be shocking and unbelievable. But history records they happened, and this is a function of history as an ‘empirical’ study. Will participants in GGDM dare to venture outside our current worldview? To act unapologetically in different ways consistent with the beliefs of an interstellar setting or just to experiment?

- ✓ Over a thousand years after the Praetorian Guard, the same strategy was employed during the War of the Sicilian Vespers (see Legitimacy, 3 Government Titles, pp. 607-608, *supra*): The ability to sell legitimacy – whether by force of arms or by divine sanction – for personal enrichment. And a version of the same scam is employed today: the non-refundable down payment, and the buyer receives nothing.

<sup>6</sup> Citation: Dana Milbank, “Cheney Authorized Shooting Down Planes,” Washington Post, p. A-01, June 18, 2004 reporting on the 9/11 Commission’s Report issued the previous day (the article is available online for free at [http://www.washingtonpost.com/wp-dyn/articles/A50745-2004Jun17\\_2.html](http://www.washingtonpost.com/wp-dyn/articles/A50745-2004Jun17_2.html)).

<sup>7</sup> Commentary: According to the article, both men testified afterward that the phone call occurred and that the authorization was given by President Bush to Vice President Cheney; National Security Advisor Condoleezza Rice testified that she overheard Cheney discussing rules of engagement on the phone with President Bush.

<sup>8</sup> Commentary: Although in the case of Spiro Agnew, the Vice President might have been the “Commander and Chief of Vice,” a post that passed to President Nixon as “Fibber in Chief” after Agnew’s resignation.

<sup>9</sup> Commentary & Citation: Oddly, this situation was raised in the Babylon 5 television series episode “Point of No Return,” five years *before* 9/11, to wit, Captain Sheridan addressed the trapped Nightwatch mutineers:

- ✓ “As of now 03:15 Earth Standard Time, I’m placing you under arrest for conspiracy to mutiny and failure to obey the chain of command. The order for Nightwatch to take over Babylon 5 Security came from the Political Office. The Political Office, despite its connection to the President, is a civilian agency outside the direct chain of command. Orders affecting Military Personnel, must come from within the Military hierarchy. Starting from the President, through the Joint Chiefs of Staff to your immediate superior officer. A Senator CANNOT give you a direct order. A GOVERNOR cannot give you a direct order! And neither can the Political Office. Make no mistake this is an illegal order. Now we’ve contacted Earthdome and requested confirmation of this order through proper channels, but since we seem to be having trouble with communications, this may take several days. Until then, you have two choices, you can stay where you are, or YOU CAN LEAVE... one at a time. On your way out, you’ll turn in your link, identicard, and weapons. You’ll be restricted to quarters until the revised orders come in. WHEN that happens anyone who wants to file a complaint against me, can do so. Otherwise have a pleasant stay.” *Id.*, CAPS IN ORIGINAL.

**Excerpts from “The city and spatial justice”**

Edward Soja, Paper prepared for presentation at the conference *Spatial Justice*, Nanterre, Paris, March 12-14, 2008.

The specific term “spatial justice” has not been commonly used until very recently, and even today there are tendencies among geographers and planners to avoid the explicit use of the adjective “spatial” in describing the search for justice and democracy in contemporary societies. Either the spatiality of justice is ignored or it is absorbed (and often drained of its specificity) into such related concepts as territorial justice, environmental justice, the urbanization of injustice, the reduction of regional inequalities, or even more broadly in the generic search for a just city and a just society.

\*\*\*

**Why spatial ? Why now ?**

1. Whatever your interests may be, they can be significantly advanced by adopting a critical spatial perspective. This is the premise that lies behind practically everything I have written over the past forty years and is the first sentence in *Seeking Spatial Justice*, the title of a book I am currently writing.
2. Thinking spatially about justice not only enriches our theoretical understanding, it can uncover significant new insights that extend our practical knowledge into more effective actions to achieve greater justice and democracy. Obversely, by not making the spatial explicit and assertive, these opportunities will not be so evident.
3. After a century and a half of being subsumed under a prevailing social historicism, thinking spatially has in the past decade been experiencing an extraordinary diffusion across nearly all disciplines. Never before has a critical spatial perspective been so widespread in its recognition and application—from archeology and poetry to religious studies, literary criticism, legal studies, and accounting.
4. This so-called spatial turn is the primary reason for the attention that is now being given to the concept of spatial justice and to the broader spatialization of our basic ideas of democracy and human rights, as in the revival of Lefebvre’s notion of the right to the city, of particular relevance here in Nanterre. Whereas the concept would not have been easily comprehensible even five years ago, today it draws attention from a much broader audience than the traditionally spatial disciplines of geography, architecture, and urban and regional planning.
5. Thinking about space has changed significantly in recent years, from emphasizing flat cartographic notions of space as container or stage of human activity or merely the physical dimensions of fixed form, to an active force shaping human life. A new emphasis on specifically urban spatial causality has emerged to explore the generative effects of urban agglomerations not just on everyday behavior but on such processes as technological innovation, artistic creativity, economic development, social change as well as environmental degradation, social polarization, widening income gaps, international politics, and, more specifically, the production of justice and injustice.
6. Critical spatial thinking today hinges around three principles:
  - a) The ontological spatiality of being (we are all spatial as well as social and temporal beings).
  - b) The social production of spatiality (space is socially produced and can therefore be socially changed).

c) The socio-spatial dialectic (the spatial shapes the social as much as the social shapes the spatial).

7. Taking the socio-spatial dialectic seriously means that we recognize that the geographies in which we live can have negative as well as positive consequences on practically everything we do. Foucault captured this by showing how the intersection of space, knowledge, and power can be both oppressive and enabling. Building on Foucault, Edward Said states the following: “Just as none of us are beyond geography, none of us is completely free from the struggle over geography. That struggle is complex and interesting because it is not only about soldiers and cannons but also about ideas, about forms, about images and imaginings.”

8. These ideas expose the spatial causality of justice and injustice as well as the justice and injustice that are embedded in spatiality, in the multi-scalar geographies in which we live, from the space of the body and the household, through cities and regions and nation-states, to the global scale.

9. Until these ideas are widely understood and accepted, it is essential to make the spatiality of justice as explicit and actively causal as possible. To redefine it as something else is to miss the point and the new opportunities it opens up.

\*\*\*

Los Angeles has been a primary center not just in the theorization of spatial justice but more significantly in the movement of the concept from largely academic debate into the world of politics and practice. I believe it can be claimed, although it is almost impossible to prove conclusively, that a critical spatial perspective and an understanding of the production of unjust geographies and spatial structures of privilege have entered more successfully into the strategies and activism of labor and community groups in LA than in any other US metropolitan region. Spatial strategies have played a key role in making Los Angeles the leading edge of the American labor movement and one of the most vibrant centers for innovative community based organizations....

Perhaps the most dramatic example of the impact of specifically spatial approaches in the search for justice is the Bus Riders Union, an organization of the transit-dependent immigrant working poor that successfully challenged the locational biases of the Metropolitan Transit Authority and their plans for creating a multi-billion dollar fixed rail system that would primarily serve relatively wealthy suburban population at the expense of the more urgent needs of the inner city working poor, who depend on a more flexible bus network given their multiple and multi-locational job households. A court order was issued in 1996 that demanded that the MTA give first budget priority to the purchase of new buses, reduction of bus stop crime, and improvements in bus routing and waiting times. ... In LA, the notion of spatial and locational discrimination, the creation of unjust geographies of mass transit, was added to the racial discrimination arguments and helped to win the case. There are many complications to the story, but the end result was a shift of billions of dollars of public investment from a rail plan that would benefit the rich more than the poor, as is usually the case in the capitalist city, to an almost unprecedented plan that would benefit the poor more than the rich.

*“If you would see how interwoven it is in the warp and woof of civilization ... go at night-fall to the top of one of the down-town steel giants and you may see how in the image of material man, at once his glory and his menace, is this thing we call a city.” – Frank Lloyd Wright*

**View from a Height:** The two basic ‘units’ of the game (or any science-fiction interstellar ‘4X’ game) are ships and colonies. Colonies contain the position’s population base (in most cases, just expressed as industry or output numbers), and ships protect, expand, explore, enforce, and keep it all connected. It is possible that players may add, through game play, additional basic units. In some instances, Technological Devices might also be considered ‘units.’

‘Units’ are the top hierarchy game items, the main items in the game setting on which everything else is based. Units exist and operate independently within the game and the game rules; they are the driving force of the game. Physical Item Technology Patents (PITs) allow players to build units. Since you cannot build a colony (and there are no units other than colonies and ships to start the game), Physical Item Technologies essentially mean the technology to build starships.

Continuous Operational Technology Patents (COTs) allow for small improvements in the performance of existing units and installations, while Enhancement Technology Patents (ETs) are the only means to add new abilities to existing physical items, colonies, and installations.

Installations are ‘enhancements’ to colonies (as they cannot exist independent of the colony) and anything built on (‘added to’) a colony must either be an Installation or an Enhancement. Populations cannot be ‘built,’ colonies and installations (and in most cases, even ships) cannot exist independent of population, so population is not considered an ‘installation.’

Technological Devices (TDs) are most likely to stand alone (as units, physical items), and could in many cases, be considered a ‘basic unit’ of the game, but in other cases, TDs may act as Installations or Enhancements to colonies or ships or other Installations.

- ✓ ‘4X’ is a common game hobby abbreviation for “eXplore, eXpand, eXploit, eXterminate” type space games. There are some ‘3X’ games, though they are rarely called by that name; my favorite is the boardgame *Ad Astra* (2009), which has no combat.
- **The Fine Print:** System Boats – ships without stardrives – are equivalent to ships, and thus are ‘game units’ and their Tender ships are obviously game units because they are ships. See *System Boats*, 3 Construction, p. 677, *infra*.
  - ✓ Ground Units, introduced in *GROPOS*, 4 Combat, p. 985, *infra*, are a special case. They are colony enhancements when at a sovereign colony, but they are game units when not on a sovereign colony or being transported on sovereign ships, and are game units in any location *for the purposes of Special Operations Lodging* rules (see *French Vanilla*, 2 Special Operations, p. 1292, *infra*).
  - ✓ Special Operations Missions are not units nor are they enhancements in game terms. Conversely, a Fighter Complement (see *How Big is Your Flight Stick*, 1 Carriers & Fighters, p. 1050, *infra*) is never a game unit as it cannot exist independently of either a Carrier or Colony, even though in other effects and senses, it is similar to a Ground Unit.

It’s weird but you can handle it, no unhandled exceptions allowed in GGDM!<sup>1</sup>

- ✓ You can build colony ships and colony infrastructure, but the essential part of a colony – people, living biological beings of some intelligence – cannot be ‘built.’ But in science-fiction-dom this can get a bit fuzzy...clones, cyborgs. *For game purposes*, colonies cannot be built by activation of the Construction Power but Colony Ships which are Landed to create new colonies wherever a colony of that Native Population type does not exist currently (see The Landing, 4 Expansion, p. 920, *infra*), can.

*“A city is made of bricks, Pharaoh. The strong make many, the starving make few, the dead make none.”*

– Moses (Charlton Heston), *The Ten Commandments* (1956)

**Construction Zone:** The Construction Power must be activated for any kind of unit building or enhancement tasks in the game. Positions may only build at colonies that they own, and specifically, construction may only occur at colonies. Construction is a location-specific act; each activation of the Construction Power for any purpose requires one Act and one Scene, and the Scene must be on the *colonized Planet* where the Construction occurs, Scene snitching can occur. Construction at two colonized planets in the same starsystem on the same Regular Turn, requires two separate activations of the Construction Power for that purpose and a Scene on each planet.

The Construction Power may be activated for the following six purposes:

1. Colony Enhancement,
2. Colony Defense Era Upgrade,
3. Laying Keel,
4. Shipbuilding,
5. Ship Supply,
6. Scrapping.

Each activation of the Construction Power allows construction tasks to occur only for the specific purpose for which the Construction Power was activated. **With the exception of Scrapping**, the Construction Power may only be activated for *one purpose* per Regular Turn at each colony.

- ✓ However, activation of the Construction Power for the purpose of *Scrapping* may be combined with any other activation of the Construction Power for any purpose and/or *activation of the Commerce Power for the purposes of Loading or Unloading Cargo Ships* in the same turn at the same colony, *using a single Scene to satisfy all of those Power activations at that colony.*

The Construction Power should not be confused with Constructural Elements introduced previously. There is no direct relationship between the vital Construction Power and Constructural Elements in GGDM, except perhaps, that inactive Constructural Elements may cause failure of activation of the Construction Power!

- **An Industrial Action:** *All activations* of the Construction Power, for any purpose, must specify a target colony (and ship in the case of Ship Supply) and thus can fail due to inactive Constructural Elements at the target colony. Activations of the Construction Power are vitally important and thus, are an area where inactive Constructural Elements can have the greatest adverse effect.

- ✓ An ‘industrial action’ is a British term for a ‘job action’ i.e. a workers’ strike in the U.S. See Merriam-Webster online dictionary. Your workers are on strike. Even the most totalitarian state will not kill more than a few workers (i.e. ringleaders) for being on strike, preferring terror and kangaroo courts, because if they kill many workers, who is going to do the work? Workers’ strikes are, historically, an event that militant, police state, autocratic governments have difficulty addressing effectively, if the workers are willing to die for the future. Nazi Germany had a plan for this contingency, called Operation Valkyrie, which the July 20 plotters attempted to subvert.

**Lister:** *We’re on a mining ship, 3 million years into deep space. Can someone explain to me where the smeg I got this traffic cone?*

**Cat:** *Hey, it’s not a good night unless you get a traffic cone! It’s the police-woman’s helmet and the suspenders that I don’t understand!*

– Red Dwarf

**Gross Domestic Product (GDP):** The cost of construction, *except for RPs unloaded from Cargo Ships*, is deducted from the current Treasury. However, a colony may not spend more in all *location-specific activities* in a Regular Turn than that colony would have produced if taxed at the beginning of that turn, plus the RP value of whatever was Unloaded from Cargo Ships to the colony on that turn (see Downloading, 2 Commerce, p. 1202, *infra*). This GDP limits the ability of a colony to both build things and Load resources to Cargo Ships in the same Regular Turn.

- ✓ For example, a colony that would produce 20 RPs if taxed at the beginning of the Regular Turn may not both spend 20 RPs by activation of the Construction Power and also Load 20 RPs to Cargo Ships by activation of the Commerce Power in the same Regular Turn.
- ✓ Besides building at the colony and Loading RPs, variable costs of Loading and Unloading Population at the colony in the same Regular Turn also counts against the GDP, planning is key. See Sardine Tins and ...Vienna Sausages, 3 Expansion, pp. 911, 915, respectively, *infra*.

There are only so many RPs available at any particular location, no matter how much is in the Treasury. The primary purpose of Cargo Ships is to deliver RPs from other locations, importing manufactured goods, machinery, skilled labor, alloys and refined metals, and raw materials that are not available at the destination; therefore, the RPs Unloaded from Cargo Ships in the same turn are added to the destination colony’s resource limit (GDP) for Construction *on the turn they are Unloaded* only. Any RPs Unloaded and not used that Regular Turn *are lost*, not returned to the Treasury (waste, corruption, administrative costs, or used for local political gain).

- ✓ For example, if 10 RPs were Unloaded from Cargo Ships to the colony in the previous example, on the turn of Construction, the colony could build 30 RPs worth of Construction on that turn.

For clarification, RPs *Loaded* to Cargo Ships are taken from the position’s Treasury but also count locally against the Colony’s GDP for the Regular Turn. Thus, RPs Loaded to Cargo Ships are theoretically the RPs received from the last Taxation of the colony. See Uploading, 2 Commerce, p. 1199, *infra*.

When spending RPs for colony activities, such as ship building, *RPs received from Unloading Cargo Ships will be spent first, and then any remaining cost will be taken from the Treasury.* Timing the movement of RPs by Cargo Ships and Construction activities at various colonies is one of the crucial elements of the game and one of the primary benefits received by colonies for participation in a centralized interstellar government and economic system.

- ✓ “The only good thing about the collapse of Carillion then is to lay bare the reality of what is really happening to public services. As a nation we either cannot afford the services we demand, including the shiny new hospitals and prisons and the wondrous new rail lines, or we are not willing to pay more taxes to fund these collective ambitions. No doubt, as with Railtrack before it and other lower profile failures of private sector involvement in public services, there may be special factors of debt and mismanagement at work. In the end, though, we have learned an important lesson – that there is no substitute for properly funded public services and projects no matter who is running them. The collapse of Carillion merely reminds us that there is no such thing as a free lunch, a magic way of creating public services without money, no matter how much taxpayers, politicians, managers, civil servants and shareholders would like to believe in it.” – Sean O’Grady, “The collapse of Carillion lays bare the reality of what is really happening to public services,” *The Independent*, January 15, 2018.
- Manholes: There is a ‘hole’ in this system, in that a colony could activate the Construction Power several times between taxations and thus take more than its share of resources from the Treasury, i.e. more than it produced during the last taxation, or would produce if taxed (partially negating the need for Cargo Ships). I have chosen not to close that loophole in the rules. Rather, I think other factors balance, for example, the GDP per turn limit on building will create a need for more Construction Power activations than normal, and limit building potential per activation; Construction in GGDM is most efficient when only one activation is required or with the minimum possible costs in Acts and Scenes and Power Activations used. Alternatively, the Concierge could, if necessary, apply Intervention Potentials to colonies that have excessive Construction Power Activations between taxations on the theory that such activity dips into the domestic subsistence and comfort level of the population (like rationing in WWII) that will cause extra costs, failures, problems and will need to be replaced later.
- Orange Cones: All construction projects must be completed by the same colony that began them, regardless of how long it ultimately takes to complete. Colonies may not directly share in any construction even if they are in the same system; however, colonies in the same or different systems may indirectly share in construction costs by moving resources to the construction colony/site by use of Cargo Ships (or Cargo System Boats) or Trucking Transactions (see 4 Commerce, p. 1225, *supra*). This is one of the primary economic benefits of participating in a centralized interstellar nation-state or empire, or trading with aliens.
  - ✓ Trucking activations of the Commerce Power may assist co-located allied **alien colonies** in shipbuilding. Conversely, if the owner of **alien colonies** and Cargo Ships are concerned with benefiting other position’s ship and defense building, then perhaps they should not engage in trade? See Trucking, 4 Commerce, p. 1225, *infra*.

Starships exist in system space (are placed on the star on the Public Space) and are not placed at any specific planet in the system (whether or not colonized), but while they are being constructed, they are located at and belong to the colony constructing them. See Shipbuilding, 3

Construction, p. 675, *infra*. Thus two colonies in the same system cannot jointly, in a direct sense, construct a ship as unfinished ships are not located in system space.

- Material Handling: When the Construction Power is activated for any purpose, other than Scrapping, on the same turn that the Commerce Power is activated at the same colony for the purpose of *Unloading* Cargo Ships, one Scene may be used to satisfy *both* Power Activations at that colony. Further, when this occurs, the Unload RPs is processed *before* the Construction Power, an exception to Clockwork Universe, 3 The Streams of Time, p. 90, *supra*.

It might seem intuitive to place a limit on the amount of resources that can be unloaded from Cargo Ships in a turn at a colony – arguments might be offered as to the time it takes to offload the cargo, inflation effects, ‘manpower,’ etc. – however as mentioned in previous sections, there are so many undefined variables, such as what is a population factor and the length of time represented by each Regular Turn, not to mention future technologies beyond our current understanding, that there simply is no limit in the game to the amount of cargo that can be Unloaded at a colony in a Regular Turn.

- ✓ Note that, per the preceding section, if the Construction Power is activated for the purpose of Scrapping, the Commerce Power may share the same Scene if activated on the same turn at that colony for the purpose of *Unloading or Loading* Cargo Ships, in short, a position could scrap and then load those RPs to a Cargo Ship in the same Regular Turn. Activation of the Construction Power for Scrapping would require a separate activation from the activation of the Construction Power on the colony in the same turn for any other purpose. But all activations would share the same Scene on the colony if done in the same Regular Turn.
- Combat Engineers: Conquered Colonies do not produce resources during Taxation (see, Resources from Population, 2 Taxation, p. 306), thus, do not have a GDP for Construction. The Construction Power may be activated at a Conquered Colony, however,  is limited to RPs which are Unloaded from Cargo Ships to the Conquered Colony (the opposite of Looting, 3 Commerce, p. 1210, *infra*) *on the same Regular Turn* as the Construction Power is activated at the Conquered Colony. Although positions normally would not engage in Construction at a Conquered Colony, there may be some strategic or tactical situations where it is necessary, e.g., to rapidly rebuild defenses so warships don’t need to defend it or to build Institutes.

*See Appendix CON – Writ & Construction Example*  
*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*

*“No house should ever be on a hill or on anything. It should be of the hill. Belonging to it. Hill and house should live together each the happier for the other.” – Frank Lloyd Wright, An Autobiography (1932)*

*“Man is a phase of nature, and only as he is related to nature does he matter, does he have any account whatever above the dust” – Frank Lloyd Wright <sup>1</sup>*

**Things to Build:** So perhaps Man is Phase III of Nature and the awakened Ants are Phase IV?  
☺ We are awaiting instructions.<sup>2</sup>

With the exception of Institutes (see Institutionalized, 3 Colleges, p. 487, *supra*, which requires a Special Writ instead), everything built at a colony requires that the colony owner first hold a Patent allowing the building of that specific enhancement, installation, or ship. Hosting a College or Corporation at a colony does not require building, nor does Capital Status or any political status of a colony require building at that colony, or a Patent.

- ✓ For example, no colony may construct Industry, Scout Ships, or 1<sup>st</sup> Era Warships (or anything else except Institutes), unless the technology to do so is available via a Patent held by the colony’s owner.

Construction at colonies is actually constant and ongoing, as infrastructure is created, systems are repaired and upgraded, etc., and is assumed and invisible in the game. The Construction at colonies that requires activation of the Construction Power is only for the process of building the major units and enhancements recognized in the game, that is, those items specific to formation of interstellar governments and civilizations.

- ✓ Participants could think of this as a triumvirate in the Roman sense: Construction-Commerce-Technology are the *triumvirs* of interstellar civilization.
- **Cloverleaf Interchange:** Wheeled carts, while more efficient for moving heavy loads over distances, also require wide, clear hard surfaces, i.e. roads, even if just dirt paths. Thus, infrastructure is a feedback loop, whatever is built needs to be maintained, whatever is built creates more growth and demand, whatever is built will eventually be insufficient, need replaced, and upgraded or modernized, and there is no turning back, building or fixing less causes unemployment, is bad for the economy, is blight and dangerous and not good for political careers – just listen to what the politicians always promise at election time, politics is tied to civilization’s feedback loops (see *Interstellar Politics*, 1 Taxation & Census, p. 295, and *Forward Expectations*, 1 Disruption, p. 255, *supra*). The environmental impact of roadbuilding, as a metaphor for the spread of civilization, is the subject of a BeastMaster television series episode (possibly it was the episode, “Tao’s Brother” (2001)).
- **Industry:** Activation of the Construction Power for the purpose of Colony Enhancement allows the colony’s owner to build or add new Installations and Enhancements to the colony (including Orbital Cities) where the Construction Power was activated, up to the limits previously described. The primary and most frequent reason for activating the Construction Power for the purpose of Colony Enhancement is to build new Industry.

- ✓ The Industry Existential Patent allows one Industry to be constructed for every 2.5 population factors on the colony, including in Orbital Cities. Each Industry produces .5 RPs (see Resources from Industry, 2 Taxation & Census, pp. 306-307, *supra*).

Industry is an installation, costing 2 RPs each, which requires that the colony owner hold the Industry Existential Patent, that increases the position's resource production during Taxation (see Resources from Industry, 2 Taxation, p. 306, *supra*) and at the same time, increases the colony's GDP for the next time that the Construction and/or Commerce Power is activated at that location. Thus adding Industry to a colony has a 'double-effect' and positions should, if possible, obtain Industry during the setup process. Industry is an 'investment' that repays most handsomely.

- **Get to Work!:** Generally speaking, it is best and most economical to build things in one turn, that is, begin and complete building of installations and enhancements at colonies with one activation of the Construction Power. However, unless specified in the Patent, a position may take as long to build anything as desired; this may be necessary to build up small colonies due to GDP limitations. Each time a position wishes to add resources to an item that is 'under construction,' the Construction Power must be activated for the proper purpose at that colony, increasing the 'cost' of building the item or ship in terms of Acts and Scenes, Power Activations required. Ships, items, enhancements or anything that is not completed has no positive effect on the game, but do exist at the planet, and may count against capacity limitations of the colony and may be destroyed during adverse News Events, by Special Operations Black-ops, or in combat, or by whatever other entropic events occur.
- **Steep Road:** Any colony with at least five population factors (see Resources from Population, 2 Taxation, p. 306, *supra*), producing 1 RP per activation of the Taxation Power, will eventually be able to build something – hopefully Industry. Colonies with less than five population factors may slowly grow – if not destroyed or added to – to the threshold. Thus, any colony will eventually be able to begin Construction projects (consider, for example, the pregame evolution of the Homeworld, Lost Colony, and Outposter Primal States). Small, inexpensive, expendable (don't say that to the crew!) Cargo Ships may be best for frontier hopping and unloading to small colonies.<sup>3</sup>

---

**FOREMAN:** *Now, I got good news and I got bad news, fellas. Which one you wanna hear first? ... Bad news: Three guys died yesterday working the top of the wall.... The good news is I got three new job openings. Top of the wall.*

– Pacific Rim (2013)

---

**Orbital Platforms:** Although it is perhaps plausible that starships could be constructed on the ground and lifted into space, in the more probable course of things, the ability to build significant Orbital Platforms is probably a crucial step to system, and eventually, interstellar colonization. As such, there are three Existential Patents which reflect the pre-interstellar or early 1<sup>st</sup> Era development of Orbital Platforms: Orbital Shipyard, Orbital City, and Orbital Defense Base. These Patents may be obtained during the setup process or through the Patent Prosecution described in the Patent rules sections.

Doubtless, most of the time, orbital platforms will be envisioned to be in low orbit as has been common in science-fiction video from Star Trek to Babylon 5 (i.e. the defense platforms in the

final battle of the Earth Civil War in the Babylon 5 episode “Endgame” (1997)). There is some logic to this. Orbital Defense Bases must probably be in low orbit in order to effectively protect the approaches to the planet; the farther out they are, the wider the gap between them. It then follows that in order to be protected by the Orbital Defense Bases, Orbital Cities and Shipyards must be behind them, between them and the planet.

In all cases, anything *permanently orbital* at a colony is considered to be an installation and not a ship, therefore, construction of any Orbital Platform requires the activation of the Construction Power for the purposes of Colony Enhancement. Any Orbital Platform not destroyed in Combat (or by Special Operations Black-ops or an adverse News Event), can be captured.

- Orbital Shipyard: Of the three Existential Patents relating to Orbital Platforms, the Orbital Shipyard is the most crucial as an Orbital Shipyard is required to construct all starships – except Scout Ships – and System Boats during the game (Scout Ships cost more to build ‘on the ground’), Orbital Cities, and Orbital and System Defense Bases. Starships are the sinews of interstellar civilization, connecting islands of civilization separated by vast, cold interstellar void. All positions should consider obtaining the Orbital Shipyard Patent first, preferably during the setup process of the game.
  - ✓ A colony must have at least 10 population to construct an Orbital Shipyard, which costs, 15 RPs. Only *one* Orbital Shipyard can be at each colony, however, each colony on a Balkanized colony planet may have their own Orbital Shipyard.
  - ✓ As specified in Shipyard Blues, 7 Beginnings, p. 72, *supra*, a position that does not begin with an Orbital Shipyard may not begin the game with any starships, except Scout Ships. There is no provision for a position to begin the game with System Boats (even though it might make logical sense from a pre-interstellar culture).
  - ✓ The Star Trek movies should be primarily credited with bringing orbital shipyards (sometimes called dry dock, as if there is water in space) to the big screen and to science-fiction consciousness. The original Star Wars movies of the 1970s showed the Death Stars being built without shipyards, but I don’t believe that any other ships were ever shown under construction, nor were shipyards shown in the original Star Trek, meaning the concept is a later development. Star Trek: The Motion Picture (1979) began with the new Enterprise leaving the shipyard. However, new Star Trek does also include ground-based shipyards (e.g., Riverside Shipyard, Kelvin Timeline), not to mention that the Klingon Bird of Prey *Bounty* landed in Golden Gate Park in San Francisco in Star Trek IV (1986)<sup>4</sup> – which GGDM does not explicitly endorse, other than allowing that Scouts can be built without a Shipyard as a game mechanical concession (*ut supra*), albeit, more expensive than with an Orbital Shipyard.
- Orbital City: Orbital Cities, which must be built over two Regular Turns like a ship while other orbital items can be built in one turn (see Orbital City Existential Patent), by an Orbital Shipyard cost 20 RPs each (10 RPs 1<sup>st</sup> turn down payment required) and allow a colony to expand beyond the surface Maximum Habitability of the colony planet below by 15 population factors each by putting populations and industry into orbit (see Dayworld, 3 Taxation & Census, p. 315, *supra*). Orbital City technology is a direct predecessor to Colony Ships that will eventually transport populations to new planets orbiting distant stars.

The game system does not look to see how many moons each planet has, or the habitability class and limits of said moons. Rather, colonization of the moon(s) of any planet are jointly assumed as part of the planet's Maximum Habitability and/or the ability to build Orbital Cities to exceed Maximum Habitability. For some positions, Maximum Habitability limitations of the Homeworld or their initial colony planet will quickly become a problem in the early game, but for most others, Orbital Cities are a luxury that can wait until later.

- ✓ For the process of moving population to or from Orbital Cities, see Sardine Tins and Opening the Can Of..., 3 Expansion, pp. 911, 914, *infra*.
  - ✓ It is possible in some instances that the planet, for example, a gas giant, is uninhabitable and the information provided is solely for the habitability of one or more moons. This is exactly the case in the movie Avatar (2009), most viewers don't realize that the Earth-like world Pandora, is a moon orbiting a gas giant in Alpha Centauri A. Thus, the habitability of that planetary orbit would be its moon Panadora.
- Orbital Defense Base: While positions may obtain the ability to build Ground Defense Bases through the Ground Defense Base Existential Patent, the *first line of colony defense* are Orbital and System Defense Bases (each requiring a separate Existential Patent). Ground Bases are best against Raids and protecting the colony in Ground Combat. Hopefully, you will not need them anytime soon, but you will need them someday. Activation of the Construction Power for the purpose of Colony Defense Era Upgrade is detailed in 2 Combat, p. 954, *infra*.
- ✓ Colony Defense Era Upgrade is not the same as building new Defense Bases or Enhancements to existing Defense Bases both of which require activation of the Construction Power for the purpose of Colony Enhancement. An Orbital Shipyard is not required for a Colony Defense Era Upgrade.

Ground Defense Bases cost 15 RPs to construct, are constructed in a single Regular Turn (i.e. paid in full), do not require an Orbital Shipyard, and are limited to 1 Ground Base per 3 population factors on the colony. Ground Bases damaged in Ground Combat must also be repaired by activation of the Construction Power for the purpose of Colony Enhancement (see Verdun, 4 Combat, p. 997, *infra*). Hopefully, Big Bertha stayed home...

An Orbital Shipyard is required to build Orbital and System Defense Bases, however, they must always be constructed (i.e. paid in full) in one Regular Turn, not two. Orbital Defense Bases cost 20 RPs and are limited to 1 Orbital Defense Base per 10 population at the colony. System Defense Bases cost 45 RPs and are limited to 1 System Defense Base per 30 population factors at the colony, limiting them to medium and large colonies. Both Orbital and System Defense Bases can be armed with Ship Missiles and other enhancements, but not Fighter Complements (however, this could be changed by in-game developments, especially for System Defense Bases to act like 'forward deployed defensive Carriers').

- ✓ The classic problem of any fortified place has always been the theoretically infinite number of attackers vs. limited local logistics and local defeat in detail, whether it is a successful breach of the wall and storming, seizure of a gatehouse or bastion, or concentration of forces to capture a fort in a chain of fortifications. Thus, any colony defense can be overwhelmed if the attackers bring enough warships and sacrifice.

*“All low-energy delivery deflection technologies have inherent fine control and steering capability, making it possible to add just the right amount of energy to steer an asteroid originally destined for a mere close approach toward a specific Earth target. According to Rusty Schweickart, the gravitational tractor method is controversial because, during the process of changing an asteroid’s trajectory, the point on the Earth where it could most likely hit would be slowly shifted across different countries. Thus, the threat for the entire planet would be minimized at the cost of some specific states’ security. In Schweickart’s opinion, choosing the way the asteroid should be ‘dragged’ would be a tough diplomatic decision.”*

– from Wikipedia article, “Asteroid impact avoidance,” captured August 9, 2019

**Deflection Dilemma:** Suppose a large meteor was certain to hit the Earth, and that the impact could or would be a mass extinction event for life on Earth (*à la* the dinosaurs). Other than assuming the nuclear defense posture – and those who have served in the military know what I mean – what could we do about it?

It is possible that we might reconfigure our ICBMs to hit a target in the upper atmosphere (e.g., Project Icarus by MIT students in 1967, the inspiration for the TV movie, *Meteor* (1979)). Unless there are weapons in orbit – in violation of multiple space treaties, as in the movie *Meteor* (1979) that is about all we could do. We’d have to hope the blast deflects the rock, or at least pushes the large pieces in the opposite direction (per the laws of physics) but likely the result will still be catastrophic.

Any of the proposed meteor-space-object defense systems would require both a violation of existing treaties and/or an unprecedented global effort. And who would anyone trust to run the meteor defense grid without turning it back to Earth? A related issue is called The Deflection Dilemma (in which Carl Sagan had some contentious involvement), which is:

- ✓ That any system designed to deflect asteroids from impacting the Earth might also be used to deflect normally harmless rocks to a path that will cause them to impact on the Earth (similar to the previous discussion of mass-driver Orbital Bombardment, Planet Narn, 3 Taxation & Census, pp. 316-318, *supra*), or
- ✓ If an asteroid were on a collision course with Earth, who decides which countries or areas are to be risked in the deflection attempt? It’s not a simple thing, even an ocean large meteor impact could cause a tsunamis on the scale of those that hit India and other countries in 2004 (over 227,000 were killed in minutes).
- ✓ “On Thursday, an asteroid called 2019 OK, traveling at almost 15 miles a second, came unusually close to impacting Earth. The asteroid passed by about 43,500 miles away – closer to Earth than our moon is. It was one of the closest known approaches of an asteroid to Earth since we started closely tracking the movements of objects in space. If you had binoculars and knew exactly where to look, you could have briefly seen 2019 OK in the sky. NASA tracks large asteroids in order to identify any that might be on a threatening trajectory toward Earth. But 2019 OK was first seen a few days ago, and was only definitively identified as an asteroid yesterday – hours before it passed right by us.

How'd they miss it? Well, while 2019 OK could have done a lot of damage if we'd gotten very unlucky – as Swinburne University astronomer Alan Duffy told the Sydney Morning-Herald, the asteroid would have struck Earth with 'over 30 times the energy of the atomic blast at Hiroshima' – it's not actually all that big. The asteroid is estimated to be 'between 187 feet and 427 feet in diameter.' The largest passenger aircraft in service today (the Airbus A380-800) is about 240 feet long, so spotting this asteroid would have been a bit like spotting a single big commercial jet in the vast expanse of space – traveling at 15 miles a second and coming toward us directly from the sun, which makes spotting it more difficult.

Even a small asteroid like 2019 OK could potentially do a lot of damage if it'd hit Earth, rather than missing by 43,500 miles, but for it to be, as lots of outlets called it, a 'city killer' asteroid, we would have needed several more unlikely things to go wrong. A 45,000-mile near-miss is very close compared to how vast space is, but it's still a fair bit – Earth itself is about 8,000 miles across. About 0.5 percent of asteroids that come this close or closer will actually hit us." – Kelsey Piper, "A 'city-killing' asteroid just zipped by Earth. Why didn't we see it coming?" Vox, July 26, 2019.

- Skylab is Falling: I remember Sky Lab. The potential destruction of a large orbital object or starship hitting the Earth (or any planet) is a favorite visualization of video science-fiction, in addition to the destruction of Planet Mül (from *Valerian and the City of a Thousand Planets* (2017)), I also recommend watching the cinematic game trailer for *Firefall* (2012), both are available on YouTube. As to the latter, I never understood why they built a mile long warship in low Earth orbit (Sky Lab was tiny, 82.4 ft. long) and then tried to open a warp hole ('Arcfolding') while in *low Earth orbit* while being controlled from the ground,<sup>5</sup> but there goes another city in Brazil! The *Arachnids* (Starship Troopers, (1959)) didn't like Brazil either, they destroyed Buenos Aires with an asteroid (in some versions of the story).
  - ✓ I have encountered discussions on the internet asking whether a civilization could achieve spaceflight without developing advanced weaponry? The discussion of this goes to how technology develops and cultural factors. Knowledge of propellants and explosives, mechanisms, electricity, and probably or possibly nuclear power would be unavoidable and necessary. The issue of weaponry, however, lies solely with the culture; for example, if a culture never had the concept of weapons (their ancestors were not hunters/scavengers) or war, or any need for weapons (they have faced no existential dangers requiring weapons), then the tools will *likely* never be used to create advanced weapons. From this, *we might assume that any species that obtains at least orbital space flight arrives there from a history of technology and warfare*. GGDM makes this assumption. However, as one commentator (user subrunner, 7-29-16) pointed out on [worldbuilding.stackexchange.com](http://worldbuilding.stackexchange.com), a space ship, or rocket, in orbit, *is* a potential weapon (and so is a starship), like a car or aircraft is a weapon (as we know well from 9/11 and drunk drivers), with no actual weapons or special modifications necessary.
  - ✓ Take this concept and inflate it by the technology assumed to exist in the GGDM setting; what happens to those unexploded nuclear missiles, unused fuel, or runaway anti-matter or black-hole power plant when the falling, uncontrolled ship or orbital platform hits the colonized planet surface? 1.2 billion casualties (from "Firefall Intro Cinematic Trailer (HD)" GameZone YouTube Channel, 2012).

*“The cities supplied few recruits as compared to such provinces as Thrace, Isauria, Cappadocia and Armenia. Small landowners filled the ranks, receiving pay as well as exemptions from the burden of Byzantine taxation. The officers represented an aristocracy which handed down a professional tradition from father to son.”* – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 112

\*\*\*

*“But the old Byzantine system, based upon a native soldiery organized into themes, had been destroyed at the roots when the empire lost its great recruiting ground in Asia Minor. For centuries that peninsula had supported a large population with its industry and agriculture. In the past such mighty empires as Lydia and Cappadocia had sprung from those fertile plains.*

*Now after ten years of war and anarchy all prosperity vanished, never again to be fully revived down to the present day. Usually the patient toil of peasants may be trusted to heal the wounds of the earth. This time, however, sword and torch seem to have done their work too thoroughly for redemption. Only a generation after Manzikert, when the Crusaders marched through Asia Minor, they found a bitter, man-made desert in which brambles were growing out of the ruins of once thriving cities.”*

– Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 131

**Manzikert**: The fall of the vaunted Byzantine navy was not by naval defeat. In 1071 A.D. the Byzantine army was routed in a disastrous defeat at the Battle of Manzikert far inland on the eastern border near Armenia. The Byzantine emperor, betrayed by a political rival (Andronikos Doukas) who was in command of the reserves at the battle and simply marched back to camp, was captured by the Seljuk Turks and released later with humiliating concessions and peace terms.

The returned emperor was then overthrown, blinded by his enemies, and died of infection, and civil war followed. The 11<sup>th</sup> and 12<sup>th</sup> century decline of the Byzantine navy (and generally the state and civilization) traces from this defeat as in the following decades, the Seljuks and then the Ottoman Turks advanced across Asia Minor capturing the heartland of the Byzantine Empire and others encroached on islands and along European coasts.

The main bases and shipyards of the navy were in Constantinople which remained a bulwark until Ottoman capture in 1453 A.D., but the resources to build and maintain the navy came from elsewhere. Soon the Venetians and Muslim naval forces began dominating the seas as well. The sack, massacre, and wanton destruction of Constantinople in 1204 A.D. by the Fourth Crusade (occasioned by violence between pro- and anti-Crusader factions in the city) was only possible because of the poor state of the Byzantine navy and superiority of the Venetian navy. By that time, the Ottoman Turks had penetrated to the coast opposite Europe, with the Byzantines holding only Constantinople and a few scraps of coast nearby.

- ✓ This presents a historical case for Ground Combats in GGDM, which are detailed in 4 Combats generally, *infra*. Defeat in Ground Combat can have a long term effect on the power of the position’s starship forces.
- **Need & Complexity**: See further, Joseph Tainter, The Collapse of Complex Societies (1988). There is an inherent relationship between naval power and complex societies; naval power is one of the major layers of complexity added to solve problems of increasingly urbanized

population. The collapse of complex Byzantine society (and loss of territory) preceded the collapse of the Byzantine navy. Had the Byzantines resurged from Constantinople in a couple of generations, they would have reconquered a manmade desert and city ruins.

- ✓ GGDM participants should assume that interstellar colonization (which precedes the need for an interstellar navy) is also a layer of complexity being added to pregame civilizations to solve some problem in the origin homeworld or colonies. What ‘problem’ leads to, lends urge to colonization of system space, interstellar colonization? This is the staple of sci-fi stories. The question that can be partially answered in the game, is what problem are they trying to solve by far flung interstellar colonization? What is going to make us finally go out there?
- Friends & Enemies: Emperor Romanos IV Diogenes was treated worse by his political enemies than by the actual enemies of the empire during his captivity with Sultan Alp Arslan of the Seljuk Turks.<sup>6</sup> Romanos subsequently abdicated the throne on agreement that he retire to a monastery and that his life would be spared and unharmed, but that wasn’t enough for the political victors (the same traitorous usurper Andronikos Doukas) who reneged and had him blinded with hot irons and sent to an island without medical attention, from which he died shortly. His enemies heaped insult upon his blindness in his last days. Thus the defeat at Manzikart was more than another military loss; the political leadership of Constantinople lost whatever moral ‘soul’ they had remaining and the populous economic heartland was torn from the empire (and that is the true catastrophe), and by 1204 A.D. when the aristocracy, including the Patriarch, fled the Sack of Constantinople by the Fourth Crusade, they were jeered and abused by the peasants who considered the aristocratic refugees below peasantry.
  - ✓ The Crusades were ‘caused’ by the failure of Byzantine power to check the Turks. The First Crusade was in response to a call for assistance by the Byzantine Emperor and just happened to suit the purposes of the Pope and the powers of Europe at that time. The Byzantines also sometimes allied with the Turks against usurpers of the Byzantine Empire, so there was considerable political-military interplay in Anatolia.

Need & Complexity and Friends & Enemies can be thought of as the four dimensions of most design, personal, activism, work relationship, employment, life on Earth, and political problems.

---

*“Whereas most of his fellow prisoners are unmitigated thugs, Speer, by contrast, is a charming, cultivated and intelligent man. It was these qualities, combined with a conscience that subordinated everything to ambition, that made him one of the most dangerous of all the Nazis.”*

– John Kenneth Galbraith and George W. Ball, “The Interrogation of Albert Speer,” Life Magazine, December 17, 1945 (available free online)

---

## Endnotes.

<sup>1</sup> Commentary: There was a crisis in the profession late in Frank Lloyd Wright’s life: a famous architect named Albert Speer was accused of and tried at Nuremburg for using forced labor/slave labor to construct his building projects in Berlin. This must have appalled the peculiarly rational practitioners of the profession.

<sup>2</sup> Citation: Reference is to the cult classic movie, Phase IV (1974).

<sup>3</sup> **Commentary:** There are a few steep roads I will not forget. One is at the top of South Williamsport, PA where I used to deliver papers in the dark on Sunday mornings. There is a small street that comes down the hillside from the top starting at 8<sup>th</sup> Street or Pine Crest (I don't remember); when you turn onto the street and start down the hill, it looks like you are driving off a cliff, then suddenly the car goes over a hump and you are facing straight down a steep hillside.

- ✓ Other memorable places include being stopped in convoy at the top of Miners Pass on the Marine Corps base at Twenty-nine Palms at night. Wherever we were was a dirt road on a narrow ridge, looking out both sides of the truck was down steep hillsides into the darkness.
- ✓ The steep road going up to Kasey Springs on Camp Pendleton in the mid-1980s was only paved about a third or half way up from the bottom; at some point, the pavement stopped, and the guardrails ended. The gravel road is just wide enough for a truck and winds along a steep hillside or cliff like a Road Runner cartoon. There is no stopping between the bottom and the top. We were supposed to be helo-lifted up, but it was cancelled and we had to drive up. On the right side of the truck was the steep cliff or hillside coming down to the road, looking out the left side of the truck, I could see the trees, the tops of the trees, way down below. Did I mention no guardrail? And just wide enough for one truck? I assume range control made sure that no one was coming down when we started up; but then again, no one is usually up there.

<sup>4</sup> **Commentary & Citation:** *Alternate ending to Star Trek IV: The Bounty* goes critical due to the stress of time-travel and the drain or malfunction of the cloaking device, explodes and obliterates San Francisco, which causes global thermonuclear war when the U.S. blames the Soviet Union. Meanwhile, the probe in the future destroys life on Earth seeking an answer to the Humpback Whale song – wait, there may not be anything alive and no oceans on Earth when the probe arrives. And Star Trek IV doesn't end with yet another maiden voyage of the new Enterprise.

- ✓ This must be the reason why they couldn't just fly the cloaked *Bounty* to the hospital and beam Chekov out (like they beamed Gillian aboard, Spock reported the ship fully powered a minute later, or like they did the whales at the end), instead, they had to disguise themselves as physicians and go manually rescue him, holding hospital staff at gunpoint in the operating room. *See*, it all makes sense. *Star Trek sense*.

<sup>5</sup> **Commentary:** I asked, but I never really got an answer to this back when it was in closed beta. I never played the game.

<sup>6</sup> **Commentary & Citation:** Similarly, in cultures that practice widespread slavery, where slaves are objects and not subjects, domesticated animals and beasts of burden are often treated better than the human slaves (especially if unskilled) and may have more value. By the time of Romanos IV, true slavery was rare and not socially sanctioned in the Byzantine Empire, but famously, intrigue, spying, deceit and political violence were common, at least in Constantinople.

- ✓ “Slavery was common in Classical Greece and in the earlier Roman Empire. It was legal in the Byzantine Empire but became rare after the first half of [the] 7<sup>th</sup> century. From 11<sup>th</sup> century, semi-feudal relations largely replaced slavery. Under the influence of Christianity, a shift in the view of slavery is noticed, which by the 10<sup>th</sup> century transformed gradually a slave-object into a slave-subject. It was also seen as ‘an evil contrary to nature, created by man’s selfishness,’ although slavery was permitted by the law.” – from Wikipedia article, “Slavery in the Byzantine Empire,” quoting W.G. Clarence-Smith, *Islam and the Abolition of Slavery* (2006).

- Clarence-Smith is a professor at SAOS University of London, editor of Journal of Global History.

It is thus likely a historical falsehood asserted that the Byzantines used galley slaves to row. All scholarly sources I have read seem to repudiate the idea, instead asserting that oarsmen were freemen, farmer's sons, and small land owners of the same sort that filled the lower ranks of the Byzantine army. Thus, they probably were not chained literally to their benches as in the movies. The widespread use of galley slaves for rowing actually occurred much later, the Ottomans, the French, and the Knights Hospitaller, along with the Barbary Pirates, all widely used slaves, prisoners of war, convicts and debtors for rowing. Approximately 12,000 Christian galley slaves were freed from Ottoman Ships during fighting at the Battle of Lepanto in 1571, the slaves were given arms and joined the hand to hand fighting against their former masters; the Holy League fleet also had thousands of slaves on their galleys, their chains were removed before battle so that they could fight. This move is probably the actual genius stroke of leadership on the Christian side, recognizing the potential of adding tens of thousands of freed slaves to turn the tide.

*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*

*“My decision to enter Hitler’s party was no less frivolous. Why, for example, was I willing to abide by the almost hypnotic impression Hitler’s speech had made upon me? Why did I not undertake a thorough, systematic investigation of, say, the value or worthlessness of the ideologies of all the parties? Why did I not read the various party programs, or at least Hitler’s *Mein Kampf* and Rosenberg’s *Myth of the Twentieth Century*? As an intellectual I might have been expected to collect documentation with the same thoroughness and to examine various points of view with the same lack of bias that I had learned to apply to my preliminary architectural studies.... As a result, I remained uncritical...” – Albert Speer, *Inside the Third Reich* (1970), p. 22*

**Minister of Armaments:** [Interview] “I interviewed Albert Speer and indeed he knew that he had been penciled in to become minister of war in the new government had Hitler been assassinated and all of that had been carried off successfully.” – Professor James V. Koch (Old Dominion University, Norfolk, VA), *Operation Valkyrie: The Plot to Kill Hitler* (documentary, 2008).

- ✓ Albert Speer survived the purge after the July 20 Plot failed (and escaped the last surreal days of the *Führerbunker* – he appears in the movie *Downfall* (2004)),<sup>1</sup> it could be that he was not an active member of the conspiracy and learned of his proposed role afterward, or that he was considered too valuable to Germany such that his political position insulated him. There is no indication of whether he would have agreed or not, but if Hitler were dead, what else would he likely do? It is also an indication that he was not considered a true or truly dangerous Nazi Party member by the resistance and that he was considered more loyal to Germany than to Hitler or National Socialism ideology. Or they thought him controllable, malleable, as he was to Hitler.

Reports of those who met Hitler in person indicate that he was not particularly impressive one-on-one or face-to-face (generally, many of his top officials, such as Himmler and Eichmann, have been described as banal, pedantic and bookish, both physically and mentally unimpressive on the surface). I suspect this is true of most famous people, and it is the thing they fear the most (like pictures without makeup and hairdressing). I recall hearing a famous comedian who complained that because he was a famous comedian, people expected him to be funny all the time – which obviously is an artificial condition for any human not resident in a mental hospital. Consider the common theory that comedians are actually angry people, who turn to comedy, and then when they become known as a comedian, they are supposed to be funny all the time! Which feeds an anger, bittersweet.

- ✓ However, Hitler’s personal secretary, Gertraud “Traudl” Junge paints a different picture of personal interaction with him in her 2012 memoirs:
  - “I admit, I was fascinated by Adolf Hitler. He was a pleasant boss and a fatherly friend. I deliberately ignored all the warning voices inside me and enjoyed the time by his side almost until the bitter end. It wasn’t what he said, but the way he said things and how he did things.” – from “Hitler’s Final Witness,” BBC News, February 2, 2012, no authorship attributed.<sup>2</sup>

So, like everything else, impressions are relative, and the problem is famous people can't know beforehand – any more than the rest of us – the position or worldview from which they are being judged in personal interactions.

**Laying Keel:** Building a starship is an awesome undertaking, especially if it is constructed in the vacuum of orbit. Building new starships is a two-part process and requires at least two activations of the Construction Power.

- ✓ “But the money is not all spent, only a portion of it is destined for new equipment, and the equipment is not all built. It takes years to assemble fighter jets, ships and submarines.” – Glenn Kessler, Salvador Rizzo, “Fact-checking Trump’s address on the Iran missile attacks,” Washington Post, January 8, 2020.
- ✓ To begin starship construction, the Construction Power must be activated at the colony building the ship, and which has an Orbital Shipyard, only one is required, for the purpose of Laying Keel.
- ✓ At the time that the Construction Power is activated for the purpose of Laying Keel, the colony must pay half of the total cost of the ship’s construction (construction cost of ships is found on the Patent).
- ✓ “Total Cost” of a starship *would include* any enhancement technologies or additions that are required to be built with the ship; total cost *does not include* anything that can optionally be added later (e.g., Fighters, Ship Missiles, System Boats).
- ✓ The colony may lay as many keels as the colony can afford in one activation of the Construction Power at the colony for that purpose and there is no limit to the number of keels that can be in orbit at a colony.

Starships are very expensive, so, barring the importation of significant parts of the cost of the ship via Cargo Ships (or Trucking or Carting, see 4 Commerce, pp. 1225, 1229, *supra*), this does place a severe practical limit on the starships that can be constructed at smaller colonies.

- ✓ It may not seem particularly realistic that a world with an Orbital Shipyard can lay as many keels and have as many ships as desired under construction at one time. However, it works within the vague time periods of a Regular Turn and abilities expressed in GGDM. Further, the Regular Turn limitations of the local GDP and resources from Cargo Ships naturally controls shipbuilding activity. And there is always a risk of enemy attack.
- Shipbuilding: Incomplete ships and unfinished Orbital Cities are part of the colony that is building them. They have no effect on the colony or the game, they cannot do anything or be used for anything, they are *just there* until they are completed,<sup>3</sup> at which time new ships move into system space and are placed on the system’s star on the Public Space. To complete or add to the building of any keel, the Construction Power must be activated at the colony for the purpose of Shipbuilding. Any number of keels or unfinished Orbital Cities can be advanced per activation. When resources have been paid equaling the total cost of the project (not counting enhancement technologies), it is completed. Any number of Construction Power activations may be required to complete the ship or Orbital City, however, economy of action suggests that the building be completed as quickly and efficiently as possible.

- ✓ Of grave concern is the decline in the number of U.S. shipyards and overall annual shipbuilding capacity:
  - “In the 64 years since Eisenhower became President, the number of U.S. shipyards capable of building deep-draft, self-propelled, oceangoing naval and/or merchant ships of at least 400 feet in length has declined from 30 to 6 and the number of large ships they built each year has declined from 60 to 7. (The number of big yards is now technically 9 but 3 of those 9 are not active in the market.)” – from Ship Building History (<http://www.shipbuildinghistory.com/statistics/decline.htm>, Updated January 21, 2016).

The ability of the U.S. Navy to replace losses in a war and introduce new generations of ships is much less than what it was; this is a very complex issue of economics, private industry and public policy, technology, defense spending ... and politics.

- Strategic Shipyarding: One important measure of naval power is the speed at which new ships can be built, crewed and supplied. Shipyards, located at well-developed colonies, are at the core of naval hegemony in GGDM. As a historical example, analysis of the Seven Years War (“World War Zero”) has shown that the British were building ships faster and building more ships per year than the French; this, coupled with French losses in naval battles – the French lost almost every naval battle – crippled the French navy badly and, along with loss of French overseas possessions, insured British naval hegemony. The French were forced to ally with the Spanish to protect their northern coastlines and shipping (ultimately, they were disastrously defeated at Trafalgar in 1805). There is an argument that British ships were inferior to French ships in the 18<sup>th</sup> Century (see article, “18<sup>th</sup> Century Shipbuilding,” [globalsecurity.org](http://globalsecurity.org)), but the Brits had more ships and a superior naval tradition to compensate.
  - ✓ No matter how many ships a position has, it still has the same number of Power Activations. Grouping ships into fleets for movement helps (see Ad Astra, 1 Movement, p. 839, *infra*), but there is certainly a point of decreasing utility in producing more ships. There is an emphasis then on being able to do more with the ships a position has during each Power Activation, than building new ships, i.e. bigger, faster, badder.
  - ✓ An important control in many space-opera strategy games is the requirement of shipyards to build ships, and the significant cost of shipyards requiring careful choices on their placement. The cost is frequently justified in terms of needing to lift materials from the surface by brute-force launch, but that is only true of the first shipyard, after which materials can be brought by other ships. Both controls are used in GGDM, but it is important to be cognizant of the reasons. The Concierge may alter Existential Patent building costs before the game without any realistic basis, for example, making Shipyards more or less expensive or changing the build speed of the game.

---

*“In the 57<sup>th</sup> century, travel between the stars has long been an accepted fact of life. Starships with powerful jump drives form the basis of interstellar commerce and the warships that protect that commerce. But jump drives are bulky and take up volume that could be filled with defensive systems or offensive weaponry. A specialized vessel, optimized for large fleet actions, gained popularity during the Second Imperium and came to completely dominate the fleets of the Third Imperium.*”

---

*These vessels had no jump drives, had nothing in fact not directly related to producing the most effective line-of-battle combatant possible. They were carried across the interstellar distances by huge jump tenders, vessels with little or no combat ability of their own, which would release their deadly cargo before the battle began and then withdraw to a safe distance. These warships became the very symbol of large fleet actions. Because they were carried from star to star, they were called battle riders.”*

– Traveller: The New Era Battle Rider (1994) game box, back

**System Boats:** Any vessel larger than a Fighter (and not an Orbital Platform) but without a Stardrive and capable of independent operation in a starsystem, is called a System Boat. Like Starships, System Boats occupy system space and necessarily have the ability to instantly move to any place in the system as Interplanetary Movement. System Boats have no Operational Flight (OFL) or Operational Supply Limitations (OSL); that is, they cannot exist without a supporting colony or Log Ship (see Ship Systems, 3 Movement, p. 854 *et seq.*, *infra*). While there are no Existential Patents for System Boats, there are various specialized niches that could be filled by System Boats which might be more economical (lacking Stardrives) than Starships:

- ✓ For example, system boats could be built for system defense, carry fighters or to move interplanetary cargo (but not significant populations). It is also possible to develop sophisticated systems involving combinations of starships and system boats for Commerce and Combat Power activations, for example, the Traveller RPG Tender Ships and Battle Riders (*ut supra*). Tenders may or may not also carry Fighters (see Fighters, 1 Carriers & Fighters, p. 1046, *infra*), but they are not primarily Carriers.

Positions are free to develop Patents required to construct System Boats. For the purposes of the Construction Power, System Boats should be significantly cheaper than their Starship counterparts, and it may also be possible, depending on the details of the Patent, to build System Boats in one Regular Turn using either the Lay Keel or Shipbuilding purposes of the Construction Power.

- **Maiden Voyage:** Newly constructed ships *and system boats* automatically receive a crew (as part of the process) and are ready to accept orders on the next Regular Turn. Newly constructed ships and system boats begin with the active Constructural Elements of their origin world, which may change over time (see New Ships and Lost Worlds, 3 Constructural Elements, p. 204, *supra*). Origin and Native Population Types of crews are not tracked in-game.

*“But it was not until the years following the 1898 Spanish-American War – during which the inability to resupply coal at sea led to one of four battleships missing a major action – that the Navy began to develop systematic at-sea replenishment. The most successful idea used equipment exclusively located on colliers to transfer bags of coal, though it quickly became obsolete with the Navy’s shift to oil-burning engines. These early efforts nevertheless provided important foundations for subsequent systems.”*

– Commander John A. Lukacs IV, USN, “A Century of Replenishment at Sea,” CNO Naval History Essay Contest 2017, pub. August 8, 2018 on [www.history.navy.mil](http://www.history.navy.mil)

**Pre-Modern Naval History:** The implications of this cannot be understated. Replenishment of ships at sea is a 20<sup>th</sup> Century innovation; all naval history and strategy before then must be viewed in that light. Science-fiction literature, to the extent that it addresses the issue, has been ambivalent on the issue of ship supply, but GGDM is very particular on this (in a tendentious-pedant way), see 3 Movement generally, *infra*.

Further, most people do not realize that until the mid-18<sup>th</sup> Century, just before the American Revolution, mariners had no reliable means of determining longitude – pendulum clocks don’t keep time on a rocking boat at sea (I’ve been on three U.S. Navy ships at sea). The mini-series Longitude (2000) adapted from the 1995 book tells the story of John Harrison and his son in their struggles to win the Longitude Prize for his invention of the maritime chronometer (ancestor of the wrist watch). The movie, I recall, shows a couple of disastrous scenes, one ship suffering from scurvy that is lost and needs to find land to obtain fresh water, in another a fleet of ships wrecked up on rocks at the Isles of Scilly in 1707 because of a navigational error. Four Royal Navy ships were sunk, 1,500 to 2,000 died, a fifth was damaged, but refloated.

- ✓ Longitude minseries (2000) is discussed again 2 Eras, EN 2, p. 776, *infra*.
- ✓ The Longitude Act is discussed again in History Patented, 1 Patents, p. 726, *infra*.

**Transfer and Resupply:** Newly constructed ships (including Temporal Ships, see 2 Temporal Technology, p. 817, *infra*) are automatically supplied with crew, food, fuel, spare parts, medicine, whatever is required to allow the ship to employ its maximum Operational Flight Limitations (OFL) and Operational Supply Limitations (OSL) (see, 3 Movement, pp. 855-856, *supra*). Newly constructed ships also automatically benefit from all applicable Continuous Operational Technologies at the time of completion. But, new ships are not automatically supplied with Enhancement Technologies, such as Ship Missiles, Fighters, whether expendable or not.

- ✓ Newly constructed Logistical Ships (hereafter “Log Ships”) are not automatically loaded with extra *Supplies* (see Logistical Support Ships, 3 Movement, p. 860, *infra*).
  - ✓ Newly constructed Cargo Ships *are not automatically loaded* with RPs. That requires an Activation of the Commerce Power at a sovereign colony on *any Regular Turn after* the Cargo Ship is constructed (see Uploading, 2 Commerce, p. 1199, *infra*) if the ship began the Regular Turn in the system with the colony.
  - ✓ Populations *are not automatically loaded onto or appear on* newly constructed Colony Ships. That requires a separate activation of the Expansion Power on *any Regular Turn after* completion of the Colony Ship to Load Population to Colony Ships when it begins at a sovereign colony (see Sardine Tins, 3 Expansion, p. 911, *infra*).
- **Free Resupply:** Any ship arriving at any Supporting Colony (see Supporting Colony, 1 Movement, p. 840, and Operational Flight Limitation, 3 Movement, p. 855, *infra*) automatically has its Operational Flight Limitation (OFL) and Operational Supply Limitation (OSL) reset by receiving supplies from the colony. No Power Activation is required and there is no RP cost for this basic type of resupply; it just occurs automatically in the course of operations. Additionally, ships arriving at a Supporting Colony automatically receive the benefits of all new, applicable Continuous Operational Technologies (COT) developed in their absence (see Continuous Operational Technologies, 2 Patents, p. 740, *infra*). The cost of these upgrades is assumed in the development cost of the new technologies, which was paid from the Treasury. Because no Power Activation is required, *free resupply and upgrades are*

*never effected by inactive Constructural Elements* on either the ship or colony; however a colony currently involved in a Colony Combat cannot act as a Supporting Colony.

- ✓ The exception to this rule are Temporal Ships (aka ‘T-Ships’) who must always automatically make a surreptitious entry attempt on arrival and who must reveal themselves to receive any resupply or updates. See Dark Tea, 2 Temporal Technology, p. 821, and Surreptitious Entry, 3 Temporal Technology, p. 828, *infra*.

In reality, RPs should be subtracted from the colony’s next Taxation for the cost of resupplying the ships but the free resupply is a concession to ease of play, playability and to the fact that this is a space-opera setting.

- Costly Resupply: For all other types of resupply from the colony, including providing *Supplies* to Log Ships, or providing or transferring Ship Missiles or Fighters and other expendable Enhancement Technologies to any Warship or Log Ship (or boats), or to ‘upgrade’ ships with new permanent Enhancements resulting from Enhancement Technology Patents, requires an activation of the Construction Power for the purpose of Ship Supply. One activation of the Construction Power at a colony for the purpose of Ship Supply allows an ‘unlimited’ number of provisioning and transfers (*ut supra*) to any number of friendly ships (or boats) which *begin* the Regular Turn in the colony’s system, limited only by the colony’s local Gross Domestic Product (GDP) (see 1 Construction, p. 662, *supra*).

“Log Ship” is short for Logistical Support Ship and capacity is measured in RPs, see 3 Movement, p. 860, *infra*. There is no provision for transfers to or from non-sovereign colonies, however, see No Tribble At All, 2 Commerce, p. 1204, *infra*.

- ✓ *Supplies* are measured in RP cost and a Log Ship’s capacity is measured in RPs of Supplies and Enhancements it can carry (see Take Your Protein Pills, 3 Movement, p. 860, *infra*). A 1<sup>st</sup> Era Log Ship has a capacity of 20 RPs, which may be improved by subsequent Continuous Operational Technology (COT) and Enhancement (EP) Patents (see 2 Patents, p. 740, *infra*).
- ✓ *Supplies* transferred to Log Ships and any *permanent* Enhancement Technology, are assumed to be ‘constructed’ at the time of the transfer and thus, require the immediate expenditure of RPs by the colony (subtracted from the Treasury), up to and against the GDP limits of the colony during any activation of the Construction Power.
- ✓ As a game artifact, *Supplies* only exist on Logistical Ships. They ‘store’ RPs, do not ‘age-out,’ but are also non-redeemable to RPs, and as a very general matter, are probably not transferrable or usable to aliens...but that is negotiable in space-opera setting.
- ✓ Like other activations of the Construction Power, activation for the purpose of Ship Supply may share a Scene with other Construction and Commerce Power Activations at the same colony in the same Regular Turn, for the purposes of Scrapping or Loading and Unloading Cargo Ships, as applicable.
- ✓ A ship may receive from multiple colonies located in the same system, in the same turn, as long as the Construction Power is properly activated on each of the colonies that are transferring to the ships.

➤ **Transfers:** Preexisting Fighters and Ship Missiles and other *expendable* Enhancements may be transferred between eligible ships *or* between colonies and orbital defenses at a colony automatically, *with no Power Activation required*, at the *beginning of the turn* if the receiving units *begin the Regular Turn* in the same system. Enhancements may be transferred directly from bases to ships and vice-versa.

- ✓ Ships executing a Short Movement arrive at the destination at the end of the same Regular Turn as they departed and thus are in the system at the beginning of the next Regular Turn. See Space Hop, 2 Movement, p. 850, *infra*.
- ✓ Ships completing a Long Movement arrive before the first Power Activation of the Regular Turn and thus do not begin the Regular Turn in the system. This bit of timing can be crucial. See, Long Jump, 2 Movement, p. 851, *infra*.
- ✓ Because the transfer occurs at the beginning of the Regular Turn, items that are transferred cannot be built during the same turn they are transferred, they must preexist the transfer turn. Planning is key...“timey-wimey stuff.” (Dr. Who, “Blink” (2007)).

Transfer of Fighters, Ship Missiles and other *expendable* Enhancements from a colony to any eligible ship requires that the Fighters, Ship Missiles or *expendable* Enhancements be located on the colony *before* the beginning of the current turn (they may be constructed by a previous activation of the Construction Power for the purpose of Colony Enhancement). That is, unlike loading *Supplies* to Log Ships or upgrading current ships with permanent Enhancements, Fighters, Ship Missiles and generally *expendable* Enhancements are not assumed to have been “constructed” on the turn they are transferred; they must already exist on the colony.

- ✓ All provisions and transfers using an activation of the Construction Power for the purpose of Ship Supply are subject to two checks related to inactive Constructural Elements. First, the target colony must be checked to see if it obeys the Power Activation. If it does, it will attempt to execute the Ship Supply as ordered, and thereafter, each target ship must be checked individually to see whether it obeys the Power Activation and accepts the transfers and provisioning. If the colony fails to obey the Power Activation, nothing will be transferred, ship checks are irrelevant.
  - ✓ Transfers to, from and between ships and colonies at a planet with a non-sovereign **alien colony** (i.e. a Balkanized planet) also require *apostasy* checks, see Alieneq Apostasy, 3 Disruption, p. 283, *supra*.
- **Bye, Bye Birdie:** RPs and most other transferable items may not be transferred between colonies in the same system without some appropriate means of transporting them, however, Fighters are easily capable of making the transfer between any two colonies owned by the same position located in the same system, without the need for assistance from a ship. The transfer may be made instantaneously if neither colony is currently besieged (see Besieged Colonies, 3 The Sidereal Stage, p. 124, *supra*) and the receiving colony is capable of accepting the incoming Fighters.

Generally, the game rules do not anticipate the ability or desire to transfer existing installations, such as Industry and Defense Bases; the rules only address the transfer of RPs (which are used to build installations and enhancements at the destination – which could indirectly be construed to mean that at least significant pre-manufactured, modular parts were transferred) and enhancements to and from colonies and ships. It is not considered impossible to

load or tow an Orbital Defense Base, or anything else, but positions will need to develop both the need and the capabilities to do so within the course of the game.

- ✓ Massive oil drilling platforms have been towed many times over great distances from where they were constructed to oil fields. I saw a megastructure show once about such an endeavor, a massive oil rig being towed by perhaps 9 tug boats. On a related note, the *USS Cole* was lifted out of the water and transported on the deck of the semi-submersible heavy lift ship *MV Blue Marlin*; there are many photos of the *MV Blue Marlin* transporting huge radar systems and other U.S. Navy ships. In 1988, the *MV Mighty Servant 2* (which had to be modified) was used to transport the mine-damaged *USS Samuel B. Roberts* from Dubai to Newport, Rhode Island, a voyage of 101 days costing \$1.3 million.

Logistical Ships (or Boats) can be used to transfer enhancements between colonies in the same system, but not Fighters (*ut supra*), RPs or *Supplies*. For transfer of RPs between colonies in the same system, see Carting, 4 Commerce, p. 1229, *infra*.

---

*“The storm looked worse than just a blow, maybe a city killer even, the way the clouds swirled and scattered lightning across the wrecks offshore [...]*  
*His father claimed that the storms were worse every year, but Nailor had never seen anything like the monster bearing down on them.”*  
 – Paolo Bacigalupi, *Ship Breaker* (2010) <sup>4</sup>

---

**Ship Breaking:** “Scrapping”<sup>5</sup> is the process by which something is taken apart at a colony in such a way that whatever is still usable, given the current technology, is recycled. If it is desired that something be instantly destroyed, then it should either be taken into combat or a News Event used to accomplish the instant destruction (no one is likely to complain about using a News Event to instantly destroy your own stuff). Scrapping permanently removes the item, unit, installation or ship from the game; something Scrapped cannot be reconstituted.

Scrapping in GGDM is thus not the same as mothballing. There is no provision in GGDM for mothballing ships and installations (mothballing is not the same as temporal stasis) and has no use. There is no Qualor II Surplus Depot Z15 in GGDM and no need to send Counselor Troi:

- ✓ “He probably figures that we don’t get to see a lot of handsome women out this way, and someone like you might get a little more cooperation out of me. [pause] He’s probably right.” – Klim Dokachin (quartermaster of the junkyard), speaking to Counselor Troi, ST:TNG “Unification” (1991).
  - Troi negotiating with the Quartermaster is the only bit I recall 30 years later.

Three of the *Iowa Class* battleships of WWII were mothballed in 1955 and 1958 as they became tactically obsolete and vulnerable to ship-to-ship missiles, their costs were reduced to maintenance so that resources could be diverted elsewhere. The *USS New Jersey* remained in operation during the Vietnam War and was decommissioned in 1969; in the 1980s, all four of the *Iowa-class* battleships were refitted and reactivated into service as the argument swung to their potential as massive ship gun and missile platforms with improved defense systems. The *USS New*

*Jersey* was deployed to the coast of Lebanon in 1983 and fired salvos of 16-inch naval shells inland from November 1983 to February 1984 with questionable accuracy. The battleships were featured in Tom Clancy's Red Storm Rising (1983). All were deactivated in the 1990s.

- Junkyard Blues: Anything that can be brought to a Friendly, Converted, or Naturalized Colony, or that is located on any Colony (that is, belongs to the colony) can be scrapped, with the exception that any ship (i.e. Colony Ship) or Orbital City with population still on it cannot be scrapped. There is no limit to the amount of 'stuff' that can be Scrapped at a colony in a turn (based on the same argument offered earlier regarding unloading Cargo Ships).

Note, however, that Scrapping is a separate activation of the Construction Power that may be accomplished concurrently with (and separately from) another activation of the Construction Power for another purpose, and concurrently with activation of the Commerce Power for the purposes of Loading or Unloading Cargo Ships at the same colony in the same Regular Turn.

- ✓ Note that the 'scrapping' process occurs automatically for Colony Ships when they are Landed to establish a new colony. No RPs are received for this particular type of 'scrapping' activity, but a new colony is established. Be happy with that result! See, Pandorum, 4 Expansion, p. 923, *infra*.

There are limits to the amount of installations and units that may be on or at a colony, but GGDM places no limits on the number of ships a position may have in system space or in total (see Strategic Shipyarding, *ut supra*), nor does GGDM address specifically the subject of obsolete ships.<sup>6</sup> Further, while GGDM does include maintenance cost, there is no specific per unit maintenance cost in GGDM. Or perhaps it is made up in other places, see e.g., The Roads Must Roll, 4 Order, p. 567, *supra*. Thus, the scrapping rules may seem a bit superfluous, of limited use, but are included for completeness and for whenever the situation may arise – for example, if the positions sign a universal peace treaty that requires the immediate destruction of all warships!☺

- Recycling Containers: The amount of resources (RPs) received from Scrapping anything is generally between 25% and 50% of the cost of building the item. The amount received is solely at the discretion of the Concierge, however, in most cases the Concierge may simply resort to a die roll to determine the amount received back from Scrapping. For that purpose, even though all of the Power Activation costs for the Construction Power are the same, Scrapping would have to be resolved first. To be consistent with the other Construction Power rules, all RPs received from Scrapping must be either used for other Construction Activations at the same colony on the same turn, or loaded onto Cargo Ships at the same colony in the same turn. RPs received from Scrapping will not be added directly to the Treasury. Because of this, the Concierge and players may need to predetermine RPs received from Scrapping before the Power Activation to avoid guessing, confusion or waste of RPs.

---

*“The most remote location on Earth has many names: It’s called Point Nemo (Latin for ‘no one’) and the Oceanic Pole of Inaccessibility. Most precisely, its exact coordinates are 48 degrees 52.6 minutes south latitude and 123 degrees 23.6 minutes west longitude. The spot is about 1,450 nautical miles from any spot of land – and the perfect place to dump dead or dying spacecraft, which is why its home to what NASA calls its ‘spacecraft cemetery.’.. To ‘bury’ something in the cemetery, space agencies have to time a crash over that spot. Smaller satellites don’t generally end up at Point Nemo....*

---

*The problem is larger objects, like Tiangong-1: the first Chinese space station, which launched in September 2011 and weighs about 8.5 tons.... Between 1971 and mid-2016, space agencies all over the world dumped at least 260 spacecraft into the region, according to Popular Science. That tally has risen significantly since the year 2015, when the total was just 161, per Gizmodo. Buried under more than two miles of water is the Soviet-era MIR space station, more than 140 Russian resupply vehicles, several of the European Space Agency's cargo ships (like the Jules Verne ATV), and even a SpaceX rocket, according to Smithsonian.com....*

*These dead spacecraft aren't neatly tucked together, though. [Bill] Ailor said a large object like Tiangong-1 can break apart into an oval-shaped footprint of debris that extends 1,000 miles long and dozens of miles wide. Meanwhile, the land-free zone around Point Nemo stretches more than 6.6 million square miles.... While not all spacecraft wind up in the cemetery, the chances are extremely slim that anyone would get hit by debris regardless of where the spacecraft break up on Earth, Ailor said.... A bigger risk is leaving dead spacecraft in orbit."*

– Dave Mosher, “A spacecraft graveyard exists in the middle of the ocean – here’s what’s down there,” Business Insider, October 22, 2017<sup>7</sup>

## Endnotes.

<sup>1</sup> Commentary: In a chillingly deranged scene in the movie, Hitler has one last meeting with Speer in the *Führerbunker* where he comments while looking at the famous planning model of the city that it will be easier to rebuild Berlin after Germany wins the war because it has been mainly destroyed by bombing and fighting.

<sup>2</sup> Citation: <http://news.bbc.co.uk/2/hi/europe/1800287.stm>.

<sup>3</sup> Commentary: Contrary to popular myth, the Death Star under construction at Endor was not functional! Any portrayal of the hapless Death Star firing at Rebel Star Cruisers is just part of the Rebel propaganda film *The Return of the Jedi*. The cowardly Rebels really destroyed a defenseless ship, murdered thousands of loyal imperial servants.

<sup>4</sup> Commentary: I once read a case at Admiralty Law before the Federal Court in New Orleans. Defendant company operated a fleet of coastal transport ships; one ship captain ignored initial NWS storm warnings and waited too long to make for shelter on land. The ship arrived in New Orleans just before the storm and tied up at the dock, it didn't have time to go farther up the river. Other ships had heeded the warning and moved up river to (Kingsport?) Mississippi. The storm arrived in New Orleans and the surge tore the ship loose from the dock; the ship was found a half mile inland on the roof of a house.

<sup>5</sup> Commentary: Scrapping of Western electronic waste has become a major third world industry, with millions of television sets and old CRT monitors and other electronics, being shipped overseas every year to be scrapped for precious metals by poorly-paid, unprotected children and adult workers who are exposed to hazardous wastes. The precipitous drop in flat screen costs and the forced change to digital television will only make this problem worse, or alternatively, fill our landfills with unprocessed electronic junk (most places have since banned electronic junk from landfills, so now it gets tossed into empty lots or left on the curb where garbage collectors will not pick it up; this has become an urban problem). Please properly recycle your electronic waste using reputable disposal services.

<sup>6</sup> Commentary & Clarification: Long ago and far away (1989 in Camp Pendleton, California), my friends and I used to play an early computer game called *Colonial Conquest* (the subject of a Kickstarter in 2017) on Atari 1040 ST. The game had a spy function where players could pay to look at other player's territories to see how many troops were there before attacking. The program also provided AI opponents. However, the AI would do strange things, e.g., you might see 4 million troops on an AI-owned island that could not hold 100,000 troops! GGDM attempts to prevent this at least on planet surfaces, but system space is effectively infinite in the game.

<sup>7</sup> Citation & Commentary: In about 10,000 years, some archeologist will find Point Nemo after the oceans have dried up; a large part of our paleo-archeological information comes from burials and waste dumps.

## **SHARD: IV. The Secret of Fire**

**\*\*\***

### The Farmer and the Fox

A FARMER, who bore a grudge against a Fox for robbing his poultry yard, caught him at last, and being determined to take an ample revenge, tied some rope well soaked in oil to his tail, and set it on fire. The Fox by a strange fatality rushed to the fields of the Farmer who had captured him. It was the time of the wheat harvest; but the Farmer reaped nothing that year and returned home grieving sorely.

Translated by George Fyler Townsend. Aesop's Fables (p. 47). Amazon Digital Services, Inc..

**Excerpt from Alia E. Dastagir, “How American culture went nuclear – without us realizing it,” USA Today, August 6, 2015**

In the beginning, the peace symbol didn’t mean “peace” at all.

It was designed in 1958 as the logo for the Campaign for Nuclear Disarmament, formed after the atomic bomb was dropped on Hiroshima, Japan, 70 years ago Thursday, followed three days later by the bombing of Nagasaki. Over time, the logo was appropriated – as symbols often are – and redefined. The peace sign is actually a combination of semaphore signals (flag code) for the letters N(uclear) and D(isarmament). Trippy.

\*\*\*

Those macabre events of 70 years ago have permeated our everyday lives in ways we aren’t always aware. It’s there, often inconspicuously, in symbols, in language and in popular culture. The question is whether there are consequences for our obtuseness.

During the Cold War, nuclear culture, which embodied the daunting reality of nuclear weapons, was widely recognized (“duck and cover” drills). When the war ended, the nuclear threat didn’t disappear. It just became less noticeable.

“The end of the Cold War and the end of the expansion of the nuclear reactor industry caused a sea change,” said Spencer Weart, a physicist, historian and author of the book Nuclear Fear: A History of Images. “Nuclear culture is still there, but it’s now part of the collective unconscious.”

Has that made people less aware of the very real threat of a nuclear war?

At the start of 2015, nine countries – the United States, Russia, the United Kingdom, France, China, India, Pakistan, Israel and North Korea – possessed about 15,850 nuclear weapons, according to the Stockholm International Peace Research Institute. Roughly 1,800 of these weapons are kept on high-alert status.

According to the Pew Research Center, Americans have become less concerned about a nuclear attack. A 2014 Pew report found 23% of respondents believe nuclear weapons are the greatest threat to the world. That’s down from 25% in 2007 and 33% in 2002.

## **IMAGERY**

The use of the nuclear disarmament logo by other social justice movements is an innocuous seizure. The Campaign for Nuclear Disarmament, which never copyrighted the symbol, is happy to see it widely used as a sign of peace, said activist Kate Hudson, general secretary for the organization.

But a discomfiting nuclear image has also been appropriated by popular culture: the mushroom cloud.

After the atomic bombings, the mushroom cloud evoked a powerful, violent picture of enormous destruction. It took out two cities and killed thousands of people. It was serious imagery. Today, the mushroom cloud is sometimes used as a comedic tool. Kid annoys dad, trains crash, face goes red, mushroom cloud.

Robert Thompson, director of Syracuse University’s Bleier Center for Television and Popular Culture, finds the mushroom cloud’s omnipresence in comic montages bewildering.

“It would be like using the entry gate to Auschwitz,” Thompson said. “I wouldn’t think it would be trivialized, but it has been.”

### LANGUAGE

People use language every day that’s inspired by nuclear technology. “Going nuclear” has become a common expression for the ultimate or extreme action you take when all else has failed.

The term “ground zero,” now attached to the site of the destroyed World Trade Center towers, originally referred to the bombings of Hiroshima and Nagasaki and the point on the ground below the detonation of the bomb. Thompson said the term became “resacralized” after the Sept. 11, 2001, terror attacks.

When you heat up something in the microwave, you “nuke it.” Even though what’s actually happening in your microwave has nothing to do with nuclear energy. It shows how people have domesticated the power of the explosion. Albeit, incorrectly.

### TV/FILM

Back in the 1960s, Weart says, a psychologist gave people a word-association test as part of a study. The tester said “nuclear,” and the subjects answered with words like “bomb,” “laboratory” and “war.” The question was asked again in the 1990s, with subjects repeating many of the same words, except adding a new term: “The Simpsons.”

\*\*\*

Since the nuclear age began, there’s been an explosion of films and TV shows about the horrors of nuclear technology – some plausible (*The Day After*), some mythical (*Godzilla*).

But there’s been a shift in how films deal with the nuclear equation.

Weart says the Terminator franchise is typical of this idea of the unconscious nuclear culture. “It shows very graphic images of nuclear war, but it’s the background of the story. It assumes we understand it,” Weart says. “It works its way into the subconscious because you never actually stop and think about it.”

### **Excerpt from Susan Southard, “What U.S. citizens weren’t told about the atomic bombing of Japan,” Los Angeles Times, August 6, 2015**

Today, Americans’ silence on this crucial chapter of the atomic bomb story is, in large part, an extension of U.S. denial and suppression since the end of the war. Immediately after the bombings, high-level U.S. officials publicly – and adamantly – refuted news reports about the bombs’ horrific aftereffects. Gen. Leslie Groves – director of the Manhattan Project where the atomic bombs were developed – dismissed these reports as propaganda, even as he sent teams to measure radiation levels to ensure the safety of U.S. troops about to enter both cities. Later that year, Groves testified before the U.S. Senate that death from high-dose radiation exposure is “without undue suffering” and “a very pleasant way to die.”

In Nagasaki, newborn death rates skyrocketed in the nine months after the bombing: 43% of pregnancies in which the fetus was exposed within a quarter mile from the hypocenter ended in spontaneous abortion, stillbirth or infant death. Young mothers giving birth in the ruins did not know it yet, but even those infants who survived would face severe physical and mental disabilities.

For years, tens of thousands of hibakusha (“atomic bomb-affected people”) suffered agonizing radiation-related illnesses. Many died. Meanwhile, Gen. Douglas MacArthur’s occupation press code censored Japanese news accounts, personal testimonies, photographs and scientific research on the survivors’ conditions. In the United States, virtually all reports about the devastation and radiation-related deaths stopped after a confidential memo to American media outlets requested that all reports about the atomic bombs be pre-approved by the War Department – particularly those containing scientific or technical details.

In 1946 and 1947, opposition to the bombings began appearing in U.S. media – including John Hersey’s “Hiroshima,” first published in the *New Yorker*, and a scathing essay by journalist Norman Cousins in the *Saturday Review*. U.S. government and military officials hurriedly strategized how to prevent what they considered “a distortion of history” that could damage postwar international relations and threaten U.S. nuclear development. Two articles by prominent government officials – the first by Karl T. Compton, a respected physicist who had helped develop the atomic bombs, and the second by former Secretary of War Henry L. Stimson – offered intelligent and persuasive “behind the scenes” perspectives on the U.S. decision to use the bombs. These powerful justifications effectively quelled civic dissent and directed focus away from the ongoing suffering of the people of Nagasaki and Hiroshima.

By the early 1950s, hibakusha cancer rates for adults and children soared, and many more hibakusha developed liver, endocrine, blood and skin diseases, and impairments of the central nervous system. Mortality rates remained high. Most commonly, survivors experienced violent dizzy spells and a profound depletion of energy. Fears about genetic effects of radiation exposure on their children haunted them for decades. Thirty years after the war, high rates of leukemia as well as stomach and colon cancer persisted. From the survivors’ perspective, the atomic bomb had burned their bodies from the inside out.

As Japanese and U.S. scientists continue studying hibakusha, their children and grandchildren to try to comprehend the full impact of radiation exposure, can we come face to face with the terrorizing realities of nuclear weapons? We don’t have to suppress our condemnation of Japan’s attack on Pearl Harbor, mistreatment and killings of Allied POWs, and slaughter of civilians across Asia to do so. Our full understanding of history will deepen our integrity as a nation and impact our current and future nuclear weapons policies across the world.

**Excerpt from Herman Wong, “How the Hiroshima bombing is taught around the world,”  
Washington Post, August 6, 2015**

Also, these Reddit comment threads speak to the changing currency of textbooks, pillars of knowledge whose preeminence has dimmed in a world where books, articles and discussions are readily available to the curious mind. The comments are edited for length, but not for grammar or typos.

## **Japan**

In response to comment asking for anyone taught in Japan:

My wife is Japanese, born and raised in Hiroshima. Her grandparents witnessed the bomb from two different locations just outside the city as children.

She has told me about how they were taught about the bomb in her school in Hiroshima. It seems they have special classes all about the bomb. She says they learn technically how it works, all

about the effects of radiation, and about its development. She says they are taught about the decision making process behind the decision to drop it. She says they are taught in great detail about the physical and psychological effects of being directly affected by it. They are also taught about the aftermath of the bomb with regards to rebuilding the city.

It sounded very different from the lesson taught to me in U.S. schools — that the bomb was a “necessary evil” that was going to cost less lives than the supposed only alternative of an invasion of the Japanese main islands.

The Peace Memorial Park in Hiroshima is visited by the young students. They can see the A-bomb Dome from their equivalent of Central Park. In other words, there are constant reminders of this tragedy that put their city on the map.

My wife told me that these special classes on the A-bomb are only taught in Hiroshima and Nagasaki and are not part of the national curriculum in Japan in general.

### **The rest of the world**

- I am an Australian who learnt about the bombings primarily through Japanese language class. As you can probably guess there was a bias toward the Japanese with a focus on the lives lost (mostly stories about children during and born after the bombings).
- Brazilian here. I remember this part of World History being very sad and polemic. Our teachers tried hard to show us the consequences and power of the bomb.
- Canadian here. ... I remember being taught that the second bomb was unnecessary. My social studies teachers tended to vilify the U.S. for Nagasaki.
- Chilean here. It was only pointed as the weapon that ended the war. Really brief.
- French here. Basically we see the bombings as part of the atrocious disasters of World War 2, through the technological advanced massive killings weapons “progress”.
- German here. In school, most of the history of war was about the German atrocities. ... Other atrocities (killing of native Americans, Hiroshima, CIA involvement in toppling democratic states leading to torture etc.) were not covered at all, or only very briefly.
- In Greece, it goes like this: The WWII ended with the atomic bomb of Hiroshima and Nagasaki. That’s it, really, just a reference.
- What I was taught in India was that even though the Japanese never surrendered, when there was a possibility of a nuclear threat, they were ready to surrender. However, the president at the time chose to do it anyway to send a message to the world (or mainly the USSR). Nowadays, when we were taught this important moment in Indonesian history, the bombing of Hiroshima and Nagasaki was seen as a stepping stone that eventually provided the opportunity to proclaim our independence.
- Iranian here. They teach us that the U.S dropped one bomb, Japan surrendered, the U.S dropped the other bomb to test it.
- Italian here. In 4th grade (10 years old) we studied it the first time, dedicating a lot of time to the victims and the horrors of the bomb.... Later on, in middle school and high school the message was always the same: the Americans compellingly “thought” the bomb was the ONLY thing that could end the war.

- Korean here and I attended a school in Seoul. From what I remember being taught about the bomb while in Korea was 2 parts — first, to end a long drawn out invasion of Japan and any territories in order to secure a surrender. There were moral considerations but mostly the discussion involved the mechanics of using war technology developed during a time of war to save American lives. And secondly, to demonstrate to the world that the US had the technology and was willing to use it as the US considered a post war political climate.
- Here in Lithuania it just said the US needed to finish the war with Japan quickly but at the same time they needed to show strength. So that they will be taken seriously in the future.
- Malaysia. There wasn't much detail explained about the bombing, just that it happened after Pearl Harbor and the Japanese surrendered after that and then the war ended.
- I'm from Mexico, and I remember there was some emphasis on how the bomb was unnecessary (since the war was already drawing to a close) and how it was one of the many atrocities of the war.
- Netherlands here. The main narrative in high school history was the cost of invasion and the political desire for a swift end to the war.
- In New Zealand I was taught it was to speed the end of the war. The morality of it was questionable but understandable in the context of the time (i.e. no one at the time knew about black rain and the horrible drawn out deaths from radiation). The reasons for dropping it were to save American lives in a landing on the main islands after the high casualties in Okinawa and other island hopping campaigns.
- Singaporean. The main questions raised were not why the bombs were dropped, but why they were dropped so late, and only after so many died and suffered.
- Here in South Africa, we learned why the bombs were dropped, and whether that was reasonable as an action of war and as a prevention of even more deaths. We read/listened to countless primary sources, and ended the quarter with a week-long debate on whether or not it was justified.
- Swede here. We were mostly just taught about the war going on in Europe from what I can remember. ... It almost felt like we were running out of time at the end of the semester; "The Japanese attacked Pearl Harbor so the Americans dropped two bombs to end that fight".
- I was taught in Switzerland. We were taught about them as more of a start to the Cold War, rather than as an end to the Second World War. This was because it was viewed as an American show of nuclear strength to the Soviets in order to act as a deterrent, rather than just an act of aggression against Japan.
- UK History teacher here (secondary). I like to use it as an example to develop the student's argument formation. It's usually taught as a standalone lesson with the topic 'Was the dropping of the atomic bombs justified?' Give the kids evidence, reports, accounts and let them make up their mind.

## Autocatalyst & Abandonment

Selections from Jared Diamond's Pulitzer Prize winning book,  
Guns Germs and Steel: The Fates of Human Societies

BECAUSE TECHNOLOGY BEGETS more technology, the importance of an invention's diffusion potentially exceeds the importance of the original invention. Technology's history exemplifies what is termed an autocatalytic process: that is, one that speeds up at a rate that increases with time, because the process catalyzes itself. The explosion of technology since the Industrial Revolution impresses us today, but the medieval explosion was equally impressive compared with that of the Bronze Age, which in turn dwarfed that of the Upper Paleolithic.

One reason why technology tends to catalyze itself is that advances depend upon previous mastery of simpler problems. For example, Stone Age farmers did not proceed directly to extracting and working iron, which requires high-temperature furnaces. Instead, iron ore metallurgy grew out of thousands of years of human experience with natural outcrops of pure metals soft enough to be hammered into shape without heat (copper and gold). It also grew out of thousands of years of development of simple furnaces to make pottery, and then to extract copper ores and work copper alloys (bronzes) that do not require as high temperatures as does iron. In both the Fertile Crescent and China, iron objects became common only after about 2,000 years of experience of bronze metallurgy. New World societies had just begun making bronze artifacts and had not yet started making iron ones at the time when the arrival of Europeans truncated the New World's independent trajectory.

The other main reason for autocatalysis is that new technologies and materials make it possible to generate still other new technologies by recombination.

Diamond, Jared. Guns, Germs, and Steel: The Fates of Human Societies (p. 247). W. W. Norton & Company. Kindle Edition.

\*\*\*

A society that temporarily turned against a powerful technology would continue to see it being used by neighboring societies and would have the opportunity to reacquire it by diffusion (or would be conquered by neighbors if it failed to do so). But such fads can persist in isolated societies.

A famous example involves Japan's abandonment of guns. Firearms reached Japan in A.D. 1543, when two Portuguese adventurers armed with harquebuses (primitive guns) arrived on a Chinese cargo ship. The Japanese were so impressed by the new weapon that they commenced indigenous gun production, greatly improved gun technology, and by A.D. 1600 owned more and better guns than any other country in the world.

But there were also factors working against the acceptance of firearms in Japan. The country had a numerous warrior class, the samurai, for whom swords rated as class symbols and works of art (and as means for subjugating the lower classes). Japanese warfare had previously involved single combats between samurai swordsmen, who stood in the open, made ritual speeches, and then took pride in fighting gracefully. Such behavior became lethal in the presence of peasant soldiers ungracefully blasting

away with guns. In addition, guns were a foreign invention and grew to be despised, as did other things foreign in Japan after 1600. The samurai-controlled government began by restricting gun production to a few cities, then introduced a requirement of a government license for producing a gun, then issued licenses only for guns produced for the government, and finally reduced government orders for guns, until Japan was almost without functional guns again.

Contemporary European rulers also included some who despised guns and tried to restrict their availability. But such measures never got far in Europe, where any country that temporarily swore off firearms would be promptly overrun by gun-toting neighboring countries. Only because Japan was a populous, isolated island could it get away with its rejection of the powerful new military technology. Its safety in isolation came to an end in 1853, when the visit of Commodore Perry's U.S. fleet bristling with cannons convinced Japan of its need to resume gun manufacture.

That rejection and China's abandonment of oceangoing ships (as well as of mechanical clocks and water-driven spinning machines) are well-known historical instances of technological reversals in isolated or semi-isolated societies. Other such reversals occurred in prehistoric times. The extreme case is that of Aboriginal Tasmanians, who abandoned even bone tools and fishing to become the society with the simplest technology in the modern world (Chapter 15). Aboriginal Australians may have adopted and then abandoned bows and arrows. Torres Islanders abandoned canoes, while Gaua Islanders abandoned and then readopted them. Pottery was abandoned throughout Polynesia. Most Polynesians and many Melanesians abandoned the use of bows and arrows in war. Polar Eskimos lost the bow and arrow and the kayak, while Dorset Eskimos lost the bow and arrow, bow drill, and dogs.

These examples, at first so bizarre to us, illustrate well the roles of geography and of diffusion in the history of technology. Without diffusion, fewer technologies are acquired, and more existing technologies are lost.

*“There can be small men in science just as there are small men in government or business. In fact it is one of the disadvantages of big science, just as it is of big government, that the availability of huge sums attracts a swarm of elbowing and contentious men to whom great dreams are less than protected hunting preserves.” – Loren Eiseley, “The Illusion of the Two Cultures” (1964)*

**Intelligent Animals:** Technology is an organized body of knowledge about the physical universe that allows sentient beings to manipulate the physical universe to produce desirable results.<sup>1</sup> Technology is (a body of information about the physical universe) + (need) + (intellect) + (application to a practical problem), and (intellect) includes the mental qualities shared by all intelligent animals, including insight, imagination, and their own special brand of logic.

It is a fundamental assumption that all creatures share the same basic survival needs and that from this arises the desire to manipulate the physical universe for comfort. Technology is about *control*, the desire and will of intelligence to control its universe, the ability of the universe that gave rise to intelligence to be controlled, to a greater or lesser degree. It is also about looking.

Advanced technology<sup>2</sup> is the foremost, readily recognized aspect of the science-fiction genre (as the name clearly indicates) to the point where some have dismissed science-fiction *as being about* rocket ships, robots, lasers and gadgets.<sup>3</sup> These would be the same who a half century ago thought that reading comic books caused juvenile delinquency, people who mistake the symptoms for the causes.<sup>4</sup> It is true that very early science-fiction – the fiction of the Hugo Gernsback (who died shortly before I was born) era of *Amazing Stories* and *Wonder Stories*, was “a sort of animated catalogue of gadgets” (Frederick Pohl), because Hugo Gernsback was also selling electronics and radio equipment and promoting amateur radio and broadcasting through his other magazines, *Modern Electronics* and *The Electric Experimenter*.<sup>5</sup> But H.G. Wells’ *War of the Worlds* (1898), predating *Amazing Stories* magazine by 30 years, was a social commentary on the late Victorian era society, and by 1940, science-fiction writers – with the crazy monumental events of the mid-20<sup>th</sup> century turning the future to dread, dreams of science utopia to ashes – had moved on from gadget fiction. Dystopia crept into science-fiction around World War II.

- ✓ “It was also bigger than any film I’ve done in its physical stature and the way it was designed. All the people were dwarfed by the system and the architecture; it shows how insignificant human beings could be in the future.” – Sylvester Stallone interview regarding *Judge Dredd* (1995) in *Uncut #135* (April 2008), p. 118.

This describes also the feeling of the original *Bladerunner* movie where non-police were referred to as “little people” by Capt. Bryant; will our engineering and technology (and social complexity) make us diminutive? This is the core of technological dystopia.

In science-fiction literature, technology becomes the setting, the means of projection, in which our world, us, we, are projected into the sky to look back down upon ourselves, or the future, or the past, where philosophical discussions, personalities, historical cycles, and social theories are played out on a grand scale. Science-fiction is literature, and all literature in any form is ultimately about us, as we have nothing else really, to talk about.

- ✓ Residents in big cities don’t buy telescopes to look at the sky from their apartment windows. They buy them to look at people. Sky viewing in an urbanized area isn’t good anyway because of the light pollution of the night sky.

- Hox Genes: Though mostly unstated in science-fiction stories, the assumption must be made that each Native Population Type, in addition to being sapient, must also possess ambulatory ability and sufficiently manipulative appendages or organs to produce technology, i.e. the morphology (homeobox genes, Hox genes) for technology. While sapience without physical manipulation is a fascinating discussion (or not<sup>6</sup>), it is here impractical for game purposes.

- ✓ “[Christiaan Huygens] did imagine of extraterrestrial beings ‘that their whole bodies, and every part of them may be quite distinct and different from ours.’ ‘It’s a very ridiculous opinion,’ he says, ‘that it is impossible a rational soul should dwell in any other shape than ours.’ ... But he then went on to argue that they didn’t look all that funny, that extraterrestrial beings must have hands and feet and stand upright and have writing and geometry.” – Carl Sagan, *Cosmos*, Episode 6 describing a  published by Huygens in 1690, 80 years after Galileo Galilei’s *Starry Messenger* (1610).

Among the higher orders of creatures on Earth the uniform arrangement is a trunk with five protrusions, one of which is the head. The rest is details – flippers, feet, wings, hands, paws, claws. Except for insects, arachnids, and such, this seems to be the universally successful form settled upon for life *on Earth*. We have no basis to conjecture that this is universal or that it is not. The easiest way to make a true monster- or truly-alien alien-of-the-week is simply alter the form, add or subtract protrusions from the trunk, put them in different or odd places, or change their functions (e.g., hands with eye stalks). Most of the time, the monster turns out looking insectoid, because...

- ✓ In GGDM, the number of trunk protrusions and their uses have no obvious effect on the game unless it makes the creatures incapable of technology, it would be interesting if participants developed some way that it would actually matter in the game.
- Toolers from Toddlers: Toolmaking and tool use were formerly defined as the exclusive quality of humans, what makes humans able to overcome the physical world. Subsequently, however, many animals, sentient creatures such as birds and close and distant human relatives – that we do not consider to be sapient, have been observed in the wild either fashioning and using ✂s (e.g., primates), or using sticks and stones to obtain food (e.g., primates, birds, sea otters). Long before the issue of toolmaking and use was discussed, it was known that some animals, such as beavers, birds, and apes, create artificial structures for various purposes. Thus building artificial structures has never exclusively been part of the definition of humanity or sapience. Can advance technology develop without sapience?

---

*“It was suggested to me that I talk about the science content of science fiction, and I suspect that there are at least a few people in this room who think that such a title could properly only be followed by an hour of dead silence. And I’m prepared to agree that most of what we call science fiction – even ‘hard’ science fiction – is technology fiction at best. The scientific content, as a scientist would understand the term, is quite invisible. However, we do play around quite a bit with what we think of as scientific facts – or what we hope are scientific facts – and this gives us our cachet for using the label which Mr. Gernsback hung on us in 1929.”*

– James Blish, *The Tale that Wags the God* (1987) (Kindle Loc. 485-490)

---

**Neo-Luddites:** If it is not yet clear, GGDM is inherently a pro-technology setting, as is most mainstream science-fiction, whether literature or hack. It may be possible, with heavy-handed construction by the Concierge and players, to develop a Neo-Luddite, technologically decayed, or even technophobic setting. The classic example of this is Frank Herbert's Dune (1965), which was possibly inspired in part by the Imperial Chinese technological regression. Other such settings have included 'long night' scenarios such as Alfred Coppel's "Rebel of Valkyr" (1950), Gardner Fox's "Tonight the Stars Revolt" (1952), Julian May's "Duat Galaxy" setting,<sup>7</sup> and of course, Isaac Asimov's Foundation (1942) which directly address the coming Long Night.

However, the underlying problem (and the elephant in the room) of a Neo-Luddite setting is the question: Given their attitudes toward technology, how did they find themselves in an interstellar setting? In nearly all instances of interstellar science-fiction settings, the Neo-Luddite movement, group, attitude, or civilization is a post-interstellar reaction (or Long Night), stripping the civilization to the barest necessity of starship operation to keep it all going.<sup>8</sup> This is sort of a Neo-Ludditism with the addition of a precautionary principle.

- ✓ Back when I used to play AD&D in the late 1980s, I always wondered about the fantasy setting Neo-Luddite rule that 'barbarian' characters hated magic and would try to destroy magic items and wizards. Why? It cannot have always been that 'barbarians' feared and hated magic in any fantasy world (quite aside from the fact that 'barbarian' is a historically suspect archetype), otherwise, no one would have 'discovered' (or been granted) and developed magic (artefact)? And the means to make magic items (artifacts). I particularly hated it when players used it to just do dumb, counterproductive actions (probably also reflective of their mental lives and social behavior outside of D&D); some players seemed to take joy in exploiting classes and alignments to do dumb things while claiming they were role-playing their character's class and/or alignment. You know what I mean; no technology is required.
- Green Anarchists from Earth: Consider the problem of Green Anarchism (e.g., anarcho-primitivism, anarcho-naturalism): However much merit their ideas and criticisms may have, at this point, they are nearly impossible to implement. Thus, for example, while Ted Kaczynski's manifesto, published in the New York Times and The Washington Post in 1995, was well received (with care to distance the praise for the work from the criminal actions of the author),<sup>9</sup> as a creature of the early internet age, I would find it impossible to accept such ideas in actual practice. Everyone who makes the anti-technology, anti-science argument, whether it be the intellectual Ted Kaczynski's, the creationist/intelligent design turn-back-the-clock-three-centuries reactionaries, the Western Esotericism neo-pagans, or the anti-intellectual Sam Kriss-like bloggers of the world, forgets one important thing: It's too late to turn back.

GGDM is a product of technology, and of the internet age, as are any participants to the game, and we have to make the best of it: True macro processes – whether macrosocial or macro-historical (Rhetorical Question: And what is the difference?) have a momentum, take on a 'life of their own' – and that frightens us in the same way as a lynch mob.

- Dark Ages: Carl Sagan suggests in the Cosmos television series that but for 'thousand year detour' of the Dark Ages (and return to mysticism) humanity's technology would be a thousand years more advanced and we might be headed to the stars now. Sagan's assertion is reflected, for example, in the following dialogue from Stargate SG-1, "Enigma" episode

(1998): “JACKSON: Yes. Umm...we’d be colonising space right now if it hadn’t been for the Dark Ages. There was a period of over eight hundred years where science was heresy and anathema. Maybe they didn’t have that set-back.”

- ✓ The Dark Ages (476 to 800 A.D. or 500-1000 A.D.) – a term that is obsolete and maligned by scholars – occurred primarily in post-Roman Empire central and western Europe (the space-opera equivalent is the Long Night).
- ✓ Sagan’s claim is fallacious unless one considers Europe and humanity to be congruent to the exclusion of the rest of the world (see Elder Race, 5 Diplomacy, p. 1153, *infra*).
- ✓ In fact, other people, especially the Chinese, made technological advances up to the end of the 11<sup>th</sup> or 12<sup>th</sup> Century then regressed technologically under the political, religious and cultural suppression of reactionary elites. The reactionary elements intensified after European ships reached Japan and China, and especially in shogunate Japan where technology and Christianity were threats to the domination of the Samurai.
- ✓ This Eastern regression had no connection at all to the European ‘Dark Ages’ and thus, there is no way to seriously suggest that the European spirit of tinkering, or the Enlightenment could have occurred, in say, the 6<sup>th</sup> or 7<sup>th</sup> Century Europe; rather, it was the emergence – Renaissance, the name that the people of the time gave to themselves, in fact means rebirth – from the Church-dominated, decentralized authority and culturally compartmentalized, desperately poor Europe of the 12<sup>th</sup> through 14<sup>th</sup> Centuries that made the Renaissance seem like spring had come. It was a reaction.

Will technology will continue indefinitely to progress exponentially – as it has appeared to do in the last two centuries, or is there a terminal point to technological development? Will the progress of technology slow when we have perfected all applications of classic physics and reach an intuition barrier in quantum mechanics? What will technology look like on Day Million, approximately 721 years from 2018? Will the difference between their technology and ours be comparable to the difference between our technology and that of the year 1293 C.E.?

---

*“Grok means to understand so thoroughly that the observer becomes a part of the observed – to merge, blend, intermarry, lose identity in group experience. It means almost everything that we mean by religion, philosophy, and science – and it means as little to us (because of our Earthling assumptions) as color means to a blind man.” – Robert Heinlein, Stranger in a Strange Land (1961)*

---

**Grokking:** Merriam-Webster online dictionary at *grok*: to understand profoundly and intuitively. Notably the Wikiquote page shows a silhouetted couple in front of a large full moon. Whatever Heinlein thought, half a century later his term is used in IS, for example, “logstash grok pattern” and “Grok QS” on the StackOverflow forums.

“Grok” – a Martian word invented by Robert Heinlein in Stranger in a Strange Land (1961) means an understanding of the universe or anything in it that is beyond numbers and names; it is the level of understanding where numbers and names become a feeling, an intuition, an almost superlative, mystical edge understanding, without being mystical. It is perhaps what NOVA

writer Kate Becker seeks in “quantum intuition,” (see full feature quote, 4 Colleges, p. 505, *supra*); quantum physics is currently just numbers and names; to ‘grok’ is to have an illustrative-intuitive understanding and *then go beyond that*. The vastness of the universe is not something that humans *grok*, the scale of it compared to the Earth and the brief-flicker lifespans of humans, leaves us out in the cold.

- ✓ Merriam-Webster online dictionary defines *technology* as: **1:a** the practical application of knowledge especially in a particular area, **1:b** a capability given by the practical application of knowledge; **2:** a manner of accomplishing a task especially using technical processes, methods, or knowledge, **3:** the specialized aspects of a particular field of endeavor. <sup>10</sup>[Definitions]

Note that the dictionary definitions of technology (and most definitions of technology) *do not exclude* the use of ‘magic’ in most current fantasy or sci-fantasy world settings; that is, whatever ‘magic’ is or by whatever unknowable rules it operates, it only needs to be a knowledge that can be practically applied, a capability. Thus, magic in fantasy stories and games written by modern people usually substitutes for technology (e.g., non-fire illumination). And like substitute teachers in primary school, a few are very good, most are banal and benign, some are useless.

- ✓ One quality that I have always thought magic should have in a fantasy setting – to distinguish it from science and technology – is some capricious inconsistency; magic should be temperamental, like ancient gods, but display *just enough* consistency to make it worth the effort by those seeking power and to elevate practitioners above the masses. See Majik discussion in 3 Information, p. 1361, *infra*, and discussion of Clarke’s Three Laws below.

Now compare the Merriam-Webster online dictionary definition of *technology* (above) to their definition of *science*: **1:** the state of knowing: knowledge as distinguished from ignorance or misunderstanding, **2:a** a department of systematized knowledge as an object of study, **3:a** knowledge or a system of knowledge covering general truths or the operation of general laws especially as obtained and tested through scientific method. Science then includes specifically the concept of ‘systemized knowledge’ which is absent from the definition of technology.

Thus, because technology only requires knowledge applied to a practical application (e.g., engineering, invention), such knowledge can be without context or system (e.g., bows and catapults did not require systemized knowledge, only observation of properties and practical application, what Kate Becker called classical physics intuition, ‘naïve physics’); whereas science requires systemized knowledge with no practical application requirement (e.g., knowledge for its own sake). Thus, science-fiction literature can have ‘technological barbarians’ or ‘barbarians with the Bomb.’ However, given the historical context in which the term technology was coined (see EN 2, p. 697, *ut supra*), the modern common usage (and science-fiction assumption) does imply that technology is backed by systemized knowledge leading to practical application.

- Intonation of the Three: Perhaps this is a good place to solemnly recite Arthur C. Clarke’s Three Laws. Put your left foot forward, raise your right hand, look up to the sky, and *solemnly repeat after me*...

1. When a distinguished but elderly scientist states that something is possible, he is almost certainly right. When he states that something is impossible, he is very probably wrong;

2. The only way of discovering the limits of the possible is to venture a little way past them into the impossible; and most famously,
3. Any sufficiently advanced technology is indistinguishable from magic.

There is a corollary of Clarke's Third Law, of uncertain origin (sometimes credited to Niven, sometimes to Pratchett, and possibly from neither): Any sufficiently advanced magic is indistinguishable from technology, a variation of which is noted on TV Tropes and stated in a 2008 comic called "Genius Girl": Any sufficiently analyzed magic is indistinguishable from science!

---

*"It seems to me that the most important scientific content in modern science fiction are the impossibilities."*

– James Blish, [The Tale that Wags the God](#) (1987) (Kindle Loc. 627-628)

---

---

*"For a successful technology, reality must take precedence over public relations, for Nature cannot be fooled." – Richard P. Feynman, U.S. Physicist <sup>11</sup>*

---

**Technopower**: The Technology Power must be activated to advance technology. The Technology Power must be activated for the following purposes:

1. Basic Research,
2. Develop Application,
3. Patent Prosecution,
4. Reverse Engineering.

Technology is a cultural effort and is never centered in any place (even if there is a College), therefore, a Scene is rarely required to activate the Technology Power and the Technology Power *cannot fail due to inactive Constructural Elements*. The exception to this is activation of the Technology Power for the purpose of Reverse Engineering, which is location specific and requires a Scene *but not an Act*. Activation of the Technology Power for the purpose of Research requires one Act and for the purposes of Development or Patent Prosecution, requires two Acts.

➤ **Copenhagen Interpretations**: The activation of a Writ based on the Technology Power by actualization of a Fuzzy Group may be used to satisfy the Interpretation requirement of a Technology Power activation on the same Regular Turn, for any purpose. A successful Patent must be used to satisfy the Interpretation requirement for the Technology Power on the turn that the Patent is successfully prosecuted, but may not be used for that purpose *at any subsequent time*. Of course, in the event of the failure of the Patent, or the unavailability of a Writ, the News Event is the default Interpretation and must be provided with the Regular Turn actions. Just in case. A Writ may not depend in any way on a Patent.

- ✓ "Maxel, you know I love you and nothing can change that. But I do need to give you once a thorough head washing. So stand still. The impudence with which you assert time and again that the Copenhagen interpretation is practically universally accepted, assert it without reservation, even before an audience of the laity – who are completely at your mercy – it's at the limit of the estimable [...]. Have you no anxiety

about the verdict of history? Are you so convinced that the human race will succumb before long to your own folly?” – Erwin Schrödinger, Letter to Max Born (October 10, 1960), quoted in Walter John Moore, [A Life of Erwin Schrödinger](#) (1994), p. 342.

*“In the temple of science are many mansions, and various indeed are they that dwell therein and the motives that have led them hither. Many take to science out of a joyful sense of superior intellectual power; science is their own special sport to which they look for vivid experience and the satisfaction of ambition; many others are to be found in the temple who have offered the products of their brains on this altar for purely utilitarian purposes. Were an angel of the Lord to come and drive all the people belonging to these two categories out of the temple, the assemblage would be seriously depleted, but there would still be some men, of both present and past times, left inside.” – Albert Einstein*

**Temples of Science:** Like a hyperbolic cube, which exists in some direction other than the three dimensions we know, technology in GGDM civilizations exists in some other direction from the Public and Galactic Spaces. Technological development in GGDM takes place on two surfaces, the Public Space and the Era Matrix (generally hereafter, “The Matrix” or “Matrix”); Research Pieces are placed on the Public Space and migrate to Developments placed on the Era Matrix. Both eventually lead to the ‘Technology Interpretation’ of the game, Patents, which allow positions to do very interesting things and shape the physical laws of the in-game universe.

- ✓ “Marie Curie is, of all celebrated beings, the only one whom fame has not corrupted.” – Albert Einstein (does Einstein think that fame has corrupted him?).
- ✓ “Meanwhile, a new industry began developing, based on radium. The Curies did not patent their discovery and benefited little from this increasingly profitable business. ... Having received a small scholarship in 1893, she returned it in 1897 as soon as she began earning her keep. She gave much of her first Nobel Prize money to friends, family, students, and research associates. In an unusual decision, Curie intentionally refrained from patenting the radium-isolation process, so that the scientific community could do research unhindered. She insisted that monetary gifts and awards be given to the scientific institutions she was affiliated with rather than to her. She and her husband often refused awards and medals. Albert Einstein reportedly remarked that she was probably the only person who could not be corrupted by fame.” – from Wikipedia article, “Marie Curie,” captured November 2, 2018.
- ✓ “Much has changed in the conditions under which researchers work since Marie and Pierre Curie worked in a drafty shed and refused to consider taking out a patent as being incompatible with their view of the role of researchers; a patent would nevertheless have facilitated their research and spared their health.” – Nanny Fröman, “Marie and Pierre Curie and the discovery of polonium and radium,” nobelprize.org, captured October 31, 2018.

*“At the dawn of religion, all the knowledge of a particular community fitted into a spiritual framework, based largely on religious values and ideas. The spiritual framework itself had to be within the grasp of the simplest member of the community, even if its parables and images conveyed no more than the vaguest hint as to their underlying values and ideas. But if he himself is to live by these values, the average man has to be convinced that the spiritual framework embraces the entire wisdom of his society. For ‘believing’ does not to him mean ‘taking for granted,’ but rather ‘trusting in the guidance’ of accepted values.*

*That is why society is in such danger whenever fresh knowledge threatens to explode the old spiritual forms. The complete separation of knowledge and faith can at best be an emergency measure, afford some temporary relief. In western culture, for instance, we may well reach the point in the not too distant future where the parables and images of the old religions will have lost their persuasive force even for the average person; when that happens, I am afraid that all the old ethics will collapse like a house of cards and that unimaginable horrors will be perpetrated. In brief, I cannot really endorse Planck’s philosophy, even if it is logically valid and even though I respect the human attitudes to which it gives rise.”*

– Wolfgang Pauli (1927), quoted by Werner Heisenberg in *Physics & Beyond* (1971)

**Empirical Mythology:** The nexus and commonality of all human religions is a set of mythopoeic stories and related philosophies separating us, shielding us from the Existential Void.

- ✓ “The big bang is our modern scientific creation myth.” – Carl Sagan, *Cosmos*, Episode 10, see full feature quote, 4 Fallen to Earth, pp. 1552-1553, *infra*.

The current ‘scientific’ understanding of reality – Dark Matter, Higgs Boson ‘God Particle,’ Quantum Entanglement, Quantum Computing, String Theory, M-Theory, the Big Bang, that dominate the scientific news – is so divorced from the common perception of ‘reality’ that the scientific reality can be seen as an ‘empirical mythology’ of Western Civilization; that is, we know it is based on ‘hard science’ (would we think the same if it were based on sociology?) but for most daily purposes, it might as well be imaginary, yet at the same time, it is part of the Western worldview.<sup>12</sup> In this way then, why is modern science (esp. physics) different than religion? What is the difference between a molecule of Trinitrotoluene (TNT) and an ancient Greek myth to a 13<sup>th</sup> Century European Monk? What is the difference between the two to a late 20<sup>th</sup> century 8<sup>th</sup> grade student?

- ✓ Merriam-Webster online dictionary at *myth*: **1:a** a usually traditional story of ostensibly historical events that serves to unfold part of the worldview of a people or explain a practice, belief, or natural phenomenon, and **3:** a person or thing having only an imaginary or unverifiable existence.

Functionally, they are the same for *social purposes*, except that science offers material technology and not morality and afterlife (see also Why Not the Afterlife discussion, 4 The Streams of Time, p. 103, *supra*). They are also the same because a TNT molecule goes beyond physics that is intuitive to us (see Kate Becker feature quote, 4 Colleges, p. 505, *supra*). Anything beyond the human intuitive grasp gained from being born on the Earth is mystical, mythical. This is our cognitive barrier until, as Kate Becker may have suggested, we gain intuitive understanding (intuition) of things that are not everyday objects or experience on Earth.

- ✓ There was a slight tendency during the *early* Cold War (during the time of utopian dreams) to assume that scientific endeavor (presumably for the benefit of mankind's future) was inherently moral and to impute that morality individually upon the leading theorist, researchers and engineers of new technologies. I certainly got this impression in my youth. As the world has moved on (and I have moved on, grown ever crankier and more curmudgeonly), Cold War realization has separated technology and science as a tool of humanity from individual morality, both inside and outside of science (e.g., Einstein's "Temple of Science" quote, *ut supra*, p. 690), so I think the idea has faded into the background, but still sometimes emerges in modern movies about scientific and technological pioneers of the early and mid-20<sup>th</sup> Centuries.

To the people of the 18<sup>th</sup> and 19<sup>th</sup> Centuries, electricity, gravity, microbiology, evolution, geology and new chemical knowledge must have seemed this way, as well, near mystical concepts not relevant to their lives, scientific language describing esoteric nature not part of the common experience. ***Technology makes science the common experience.*** Today, we have technology based on what was esoteric in the 18<sup>th</sup> and 19<sup>th</sup> Centuries, we nod our heads knowingly about electricity, electronics, car engines, cell phones, orbital satellites and rocket launches, going to the moon and Mars, but rarely have much grasp of the science and engineering behind them.

- ✓ "We live in a society exquisitely dependent on science and technology, in which hardly anyone knows anything about science and technology." – Carl Sagan.

Technology that affects people's lives on a daily basis at least cognitively 'normalizes' science within their cultural reality, even if not understood. Though it is difficult to understand what technology might come from understanding dark matter, "God particles," and such, the next frontier of mythology to technology seems to rest in quantum entanglement, when engineers find a use for it in computing and communications.

- ✓ "Do agnostics think that science and religion are impossible to reconcile? The answer turns upon what is meant by 'religion.' If it means merely a system of ethics, it can be reconciled with science. If it means a system of dogma, regarded as unquestionably true, it is incompatible with the scientific spirit, which refuses to accept matters of fact without evidence, and also holds that complete certainty is hardly ever impossible." – Bertrand Russell, "What is an Agnostic" (1953).
- ✓ See also discussion in Patent Defect, 3 Patents, p. 752, *infra*.
- **Easter Bunny:** While most Westerners don't believe in Santa Claus or the Easter Bunny after about 2<sup>nd</sup> Grade, most adults continue to believe in some mumbo-jumbo version of the afterlife, even while claiming to be educated, intelligent adults. This insistence is like a child insisting that they believe in Santa after finding his gifts hidden in a parent's closet before Christmas. If Santa Claus or the Easter Bunny were mentioned in the Bible, would you still believe in them? So what are we teaching our kids? 'Ha, ha, I know that Santa Claus and the Easter Bunny are lies and I am therefore an adult, but I still cling to the idea of the afterlife because the priests tell us so?'
- ✓ "I think I've gone through quite an ordinary series of steps in life. I began as most children began, with God and Santa Claus and the tooth fairy and the Easter Bunny all being about the same thing. Then I went through the things that I think sensitive people go through, wrestling with the thoughts of Jesus – did he shit? Did he screw?"

I began to dare to believe that God wasn't some white beard. I began to look upon the miseries of the human race and to think God was not as simple as my mother said. As nearly as I can concentrate on the question today, I believe I am God; certainly you are, I think we intelligent beings on this planet are all a piece of God, are becoming God. In some sort of cyclical non-time thing we have to become God, so that we can end up creating ourselves, so that we can be in the first place. ... My own feeling is that relation to God as a person is a petty, superstitious approach to the All, the infinite." – Gene Roddenberry as quoted by Terrance A. Sweeney, *God &* (1975).

I believe Mr. Roddenberry is talking about an epochal process where humans become their own First Cause or Prime Mover. This contains a paradox that would need to be resolved. His 'empirical mysticism' was a belief in a human-centric ontological paradox. See Rose Tyler's "Bad Wolf" speech, Dr. Who "The Parting of the Ways" (2005), "I am the Bad Wolf, I create myself..."

- ✓ "After looking into the heart of the TARDIS, the Time Vortex itself filled Rose Tyler, who then temporarily became the Bad Wolf entity. She scattered the two words throughout time as a sign to herself that she was linked to the Doctor, *creating a looped ontological paradox.*" – from Tardis Wiki article "Bad Wolf (entity)," captured August 22, 2019 (emphasis added).
- Biblical Miracles: A common argument that I heard many times in my youth was the dismissal of Biblical miracles by pointing out that we could do the same now with relative ease. Virgin birth? Can be done. Routinely if we wanted, we do it in animal breeding via artificial insemination. Destroying a city with a column of fire from the sky. Has been done. Twice.<sup>13</sup> Usually these arguments were offered in support of 'ancient astronaut' theories, but ancient astronauts aside, that doesn't mean they are not correct factual observations (and it is simply a matter of what we think they 'mean' and whether the meaning withstands scrutiny).<sup>14</sup>
  - ✓ Though I do not know the title, I remember reading a description of a near future sci-fi movie where a modern corporation conspired to create a second 'Virgin Mary' out of an unwitting teen girl to contrive and control a 'second coming' of Christ on Earth for their own marketing purposes. Talk about cynicism!

In my youth, it was frequently discussed in UFO-conspiracy circles how virgin birth really isn't that amazing or difficult in modern terms; as most events described in the Bible, other than creation of the universe and the Earth, are now within our scientific and technological purview. Inevitably, people connected the atomic bombings of Japanese cities in 1945, for example, with the legendary destruction of Sodom and Gomorrah; 'fire and brimstone' destruction has been reinterpreted in modern terms as some sort of nuclear strike.

Biblical literalist counter this modern 'explaining away' of miracles that they are still miracles because they happened well before humans had the ability to do the same, much less understand. They maintain that our non-technological ancestors could not have thought of these things if they didn't happen, and therefore, the stories are still true. This latter however, ignores the wild stories of other religions that are now considered myths (e.g., Greek and Norse mythology), and implies then that those stories must be equally true.

But implicit in this argument is an admission that humans have by some measure, rapidly advanced to power that would have been (and was) considered god-like by our not-so-distant

ancestors: Any *non-human* destruction of all life on Earth or destruction over a massive area would be (and still is) called an ‘act of God’ (check your insurance policy, the words are probably in the fine print). Are humans and their actions not an act of God then? But see, that contradicts the creation stories. So we are not and have never been quite clear on that.

- Another Duality: It is of the greatest importance that science not become religion – something just a step or two beyond scientism (*Google it*); this argument is not about whether it is or is not, but about the phenomenon of modernity worldview that have effectively replaced one belief system with another, *sans* an intelligent creator (unless the Big Bang is/was).
- ✓ “Science is not a perfectly rational system. It cannot be, it is a human construction of reality and, as such, must be imperfect. No scientific theory is absolute; none will ever arrive at ‘truth.’ All sciences are tentative interpretations of reality; there should be doubt and continual checking of empirical reality to discipline theory to better interpret and explain reality.” – Frank Elwell, Macro Social Theory (2009), Kindle Edition, p. 21.
  - ✓ ‘Intelligent design,’ seemingly more palatable, is a branch of ‘creation science’ as identified by the Court in *Kitzmiller v. Dover Area School District* (400 F. Supp. 2d 707 (M.D. Pa. 2005)), also *Edwards v. Aguillard* (482 U.S. 578 (1987)), *McLean v. Arkansas* (529 F. Supp. 1255 (E.D. Ark. 1982)) re: teaching of ‘creation science.’
  - ✓ Isaac Asimov probably had this same idea: “The barbarized inhabitants of the four kingdoms believe that the Foundation’s technicians are magicians. Being unable to make these people understand the difference between magic and science, the technicians finally give up and allow themselves to be worshipped as holy men.” – from Wikipedia article, “Church of Science” (about an entity in Isaac Asimov’s Foundation (1951)). The unnamed religion of the Church of Science has been called *scientism*.

Science educators do a premier job – when anyone is listening – of distinguishing science from religion (and such farces as ‘creation science’) by pointing out that science, unlike religious beliefs, does not have predetermined conclusions to which the empirical evidence will either be molded or ignored, science must always be able to be questioned and reexamined, for if science becomes definitionally the same as religion, then the ‘creation science’ pundits can cry to have evolution removed from public schools as a violation of the Establishment Clause of the First Amendment to the Constitution (they try to make this argument anyway – a form of intentional failure to understand – but it falls on deaf ears).

- ✓ “But he (Galileo) was not an idiot,... Only an idiot could believe that scientific truth needs martyrdom – that may be necessary in religion, but scientific results prove themselves in time.” – David Hilbert quoted by Constance Reid, Hilbert (2<sup>nd</sup> Ed, 1996), p. 92.

Yet, the problem of duality which began in ancient times, has seemed to ever widen, especially in the last four centuries. Science cannot answer the questions which have concerned humanity the most from the beginning, and religion cannot compete in arguments with science, but can at least provide comfort if not answers to humanity’s basic question. The two seem to be talking past each other (i.e. Thrasymachus and Socrates in Plato’s Republic):

- ✓ “Science and religion ask different questions about different things. *Where religion addresses ontology, science is concerned with ontic description.* Indeed, it is what

Orthodox theologian David Bentley Hart calls their ‘austere abdication of metaphysical pretensions’ that enables the sciences to do their work.” – Michael Robbins, “Atheists Used to Take the Idea of God Seriously. That’s Why They Mattered.” Slate Magazine, July 8, 2014 (emphasis added).

Which is why the debate is so murky, bewildering and irritating. Will there be a point in the future at which a holism is achieved?

- ✓ “So, there is a sense in which we build meta-systems above ourselves to fill in the space that we previously populated with an entity that was supposed to be the intentional designer, the creator (even though there isn’t one) and because we – I don’t necessarily mean we in this room, but we as a species – design and create one and then allow ourselves to behave as if there was one, all sorts of things begin to happen that otherwise wouldn’t happen. ... [lengthy Feng Shui discussion sadly omitted here]

...

So, my argument is that *as we become more and more scientifically literate, it’s worth remembering that the fictions with which we previously populated our world may have some function that it’s worth trying to understand and preserve the essential components of*, rather than throwing out the baby with the bath water; because even though we may not accept the reasons given for them being here in the first place, it may well be that there are good practical reasons for them, or something like them, to be there.

I suspect that as we move further and further into the field of digital or artificial life we will find more and more unexpected properties begin to emerge out of what we see happening and that this is a precise parallel to the entities we create around ourselves to inform and shape our lives and enable us to work and live together. Therefore, I would argue that though there isn’t an actual god there is an artificial god and we should probably bear that in mind. That is my debating point and you are now free to start hurling the chairs around!” – Douglas Adams, “Is there an Artificial God?” speech at Digital Biota 2, Cambridge U.K., September 1998 (transcript and audio recording of the more than one hour speech are available free at <http://www.biota.org/people/douglasadams>) (emphasis added).

- “[Douglas] Adams described himself as a ‘radical atheist,’ adding ‘radical’ for emphasis so he would not be asked if he meant agnostic.” – from Wikipedia article, “Douglas Adams,” captured March 7, 2019.
- Frankenstein: Mary Shelly’s 1818 novel Frankenstein (combining science, occult and romantic themes) firmly entrenched in human consciousness (e.g., Public Space in GGDM), transformed religious suspicion into the idea that rapidly developing human science and technology was making humanity parodies of the *ancient gods*; WWII and the atomic bombs completed the process, the space race and moon landings<sup>15</sup> cemented it.
  - ✓ “Man is by nature unable to want God to be God. Indeed, he himself wants to be God, and does not want God to be God.” – Martin Luther, “Disputation Against Scholastic Theology” (1517), Thesis 17.

This is, of course, consistent with the contention that God made man in his own image (Genesis 1:27). We might assume then that God doesn’t want to be and cannot be anything other

than or less than God, so why would man (which makes it perplexing that his son was a human)? And why would God want God to be God if he were man? Additionally, it is also no small matter that the Abrahamic God is mostly associated with punishment (i.e. damnation), so humans don't want God to be God. If, as Brian Aldiss argues, we accept Mary Shelly's novel as the first true work of science-fiction (Johannes Kepler's *Somnium* is also a candidate, but lacks an overt, intentional act), then arguably it follows that science-fiction's development is or has been an expression of this very same suspicion or idea about humanity's quest for godhood.

*“In Nietzsche we find the full power and terror that atheism is capable of, for Nietzsche scorned mere unbelievers, who, [David Bentley] Hart writes, ‘do not dread the death of God because they do not grasp that humanity’s heroic and insane act of repudiation has sponged away the horizon, torn down the heavens, left us with only the uncertain resources of our will with which to combat the infinity of meaninglessness that the universe now threatens to become.’*

*Nietzsche’s atheism is far from exultant – he is not crowing about the death of God, much as he despises Christianity. He understands how much has been lost, how much there is to lose. As he writes in *The Gay Science*: ‘The event itself is far too great, too distant, too remote from the multitude’s capacity for comprehension even for the tidings of it to be thought of as having arrived as yet. Much less may one suppose that many people know as yet what this event really means – and how much must collapse now that this faith has been undermined because it was built upon this faith, propped up by it, grown into it; for example, the whole of our European morality.’*

*Nietzsche realized that the Enlightenment project to reconstruct morality from rational principles simply retained the character of Christian ethics without providing the foundational authority of the latter. Dispensing with his fantasy of the Übermensch, we are left with his dark diagnosis.*

*To paraphrase the Scottish philosopher Alasdair MacIntyre, our moral vocabulary has lost the contexts from which its significance derived, and no amount of Dawkins-style hand-waving about altruistic genes will make the problem go away. ...*

*The point is not that a coherent morality requires theism, but that the moral language taken for granted by liberal modernity is a fragmented ruin: It rejects metaphysics but exists only because of prior metaphysical commitments. A coherent atheism would understand this, because it would be aware of its own history.”*

– Michael Robbins, “Atheists Used to Take the Idea of God Seriously. That’s Why They Mattered.” Slate Magazine, July 8, 2014 (emphasis added)

**Modernity Machines:** cf. Wolfgang Pauli feature quote, *ut supra*, p. 691 and Douglas Adams quote, *ut supra*, p. 695. Consider the following in light of Michael Robbins’ characterization of “Nietzsche’s atheism” (*ut supra*):

- ✓ “This idea of evil was almost entirely new. Before the Enlightenment, most theological and philosophical thinking about the nature of evil rested on the assumption that evil deeds are the product of strong passions – pride, ambition, envy, hatred. During the Enlightenment and into the 19<sup>th</sup> century, many Western thinkers suggested that evil grew less out of man’s dark passions than from unjust social conditions, and many assumed that it would eventually be eradicated through social and political transformation. By [Hannah] Arendt’s time, that confidence had been shattered by the terrors of Nazi-occupied Europe, Japanese-occupied China, and the Soviet Union. Secular intellectuals were left groping for new explanations, and to many it appeared that Arendt had found one. The killing fields of Cambodia, Rwanda, and Bosnia have

kept the question – and Arendt’s answer – very much alive. ‘We have a sense of evil,’ Susan Sontag has said, but we no longer have ‘the religious or philosophical language to talk intelligently about evil.’” – Stephen Miller, “A Note on the Banality of Evil,” *Wilson Quarterly*, Autumn 1998 (available free online).

- See further discussion, 1 Special Operations, EN 9, pp. 1282-1283, *infra*.

Mr. Miller’s assertions about the Enlightenment are supported and clarified by Prof. Lisa Feldman Barrett, one of the leading researchers of emotions:

- ✓ “The concept of ‘Emotion’ itself is an invention of the seventeenth century. Before that, scholars wrote about passions, sentiments, and other concepts that had somewhat different meanings.” – Lisa Feldman Barrett, How Emotions Are Made: The Secret Life of the Brain (2017).
- ✓ “The word ‘smile’ doesn’t even exist in Latin or Ancient Greek. Smiling was an invention of the Middle Ages, and broad, toothy-mouthed smiles (with crinkling at the eyes, named the Duchenne smile by [Paul] Ekman) became popular only in the eighteenth century as dentistry became more accessible and affordable.” *Id.*<sup>16</sup>

It thus appears that the modern concept of ‘evil’ *coincides with* the development of the concept of ‘emotions’ which Prof. Barrett maintains were not exactly the same as “passions, sentiments and other concepts” on which previous ideas of ‘evil’ were based. Evil previously was immoral excess of passions expressed in acts (*actus rea*) without reference to emotional states (*mens rea*). This is similar to the parallel development of pinhead vs. godhead in Western literature; the idea of the Enlightenment is that we can shine light in previously dark places, and one of those places included what goes on inside people’s heads. A very Christian concept that became modern mental sciences. Evil, emotions, godhead, enlightenment are all part of the bundle of *modernity*.

- ✓ See Godhead and Pinhead discussion, 1 The Sidereal Stage, p. 110, *supra*.
- ✓ See also discussion of the relationship of Christianity and mental health professions, Dream Police, 1 Dreamtime, p. 132, *supra*.

---

*“Animals have come to mean so much in our lives. We live in a fragmented and disconnected culture. Politics are ugly, religion is struggling, technology is stressful, and the economy is unfortunate. What’s one thing that we have in our lives that we can depend on? A dog or a cat loving us unconditionally, every day, very faithfully.” – Jon Katz*

---

## Endnotes.

<sup>1</sup> Commentary: We do not consider birds to be sapient, but they definitely manipulate the environment for their comfort from nest-building to termite-fishing. Thus, the word “sentient” is used here instead of “sapient.” While they may not be toolmaking – and that is probably a definition of technology, tool making – they are tool using.

<sup>2</sup> Commentary: The term ‘technology’ was first used in 1859 (Merriam-Webster dictionary), which approximately coincides with the beginning of the ‘Age of Invention,’ the modern scientific era and the industrial revolution. Science-fiction literature began shortly afterward. Technology has been retroactively applied to inventions from times long before the term even existed; inventions that ancestors certainly did not think of as ‘technology.’

<sup>3</sup> Citation: “P.J. Snyder reviewed Saturn 3 in *Ares Magazine* #2 and commented that ‘Saturn 3 is a sloppy, shoddy production, of the sort that someone out there thinks sf fans just eat up. One hopes the producers and directors

working the genre will realize this audience demands more than a leggy blond being chased by a robot. They may have such limited visions, but the audience doesn't.” – from Wikipedia article, “Saturn 3,” April 25, 2020.

<sup>4</sup> Citation: “Buck Rogers at that time was not taken seriously by adults, but the kids loved it. During the 1930s, people who heard the term ‘science fiction’ would often refer to sci-fi as ‘that Buck Rogers stuff,’ and immediately would think of ray-guns and rocket ships and robots.” – JonnyBaack (narrator), “Everything you need to know about Buck Rogers in the 25th Century (1979),” JonnyBaack YouTube Channel, November 27, 2018.

<sup>5</sup> Commentary: The founder of the science-fiction magazine industry – after whom its most famous award is named (and which Spinrad denigrates as a “literal popularity contest”) – was a poor author and a sleeze who stiffed his writers, *yet he is honored for the idea*, for trying to make a living at it, and for his hobby-electronics pioneering.

<sup>6</sup> Commentary & Citation: The discussion in Dalton Trumbo’s 1938 book (and later movie) Johnny Got His Gun is definitely on the ‘not’ side; parts of the 1971 movie were used in the video for Metallica’s “One” (1988).

- ✓ Science-fiction musing has occasionally ventured into the subject of sapience without ambulation or manipulative ability. I recall a Stargate SG-1 episode that featured sapient creatures that could form human faces out of their crystalline form, but apparently had no ambulatory means or manipulative appendages. In a creepy ending to the 2006 Dr. Who episode, “Love & Monsters” featuring ELO’s 1977 song “Turn to Stone,” one of the hapless mortals has their life force preserved in a pavement stone with a face capable of expression and a voice. Star Trek and other science-fiction stories have liked the concept of a sapient amorphous blob that can take humanoid form through sheer will. But they are limited to creature-of-the-week episodes.

<sup>7</sup> Citation: “Thousands of years before the action of the novels, the inhabitants of Duat developed interstellar travel, and colonized other planets in their native galaxy. These other planets came to be called ‘Daughter Worlds.’... A series of wars and the passage of time cut off Duat.... Among the daughter worlds only Lene retained any form of space travel, and only very primitive reaction engines. The war left Duat with a wildly varying climate, and because of this, over a thousand generations on Duat, the race diverged into two separate races, the Tanu and the Firvulag. The Tanu lived in the open highlands and grew tall and lithe. They were metapsychically latent and developed and employed torcs to raise them to a limited form of metapsychic operancy. The Firvulag who dwelt in the dark and wet lowlands grew small and hardy and were naturally operant, but most were much more weakly powered.... The divergent races were hostile to each other and together developed a highly ritualized battle-religion to formalize the war between them. When science advanced enough to allow for interstellar travel once again (by the daughter worlds), Duat was rediscovered and while the original race was shocked at the divergence of the races there from their own, it was then discovered that the torcs also worked well on most but not all the inhabitants of the daughter worlds. Certain (female) members of Lene, known as Shipsouses, developed a symbiotic relationship with interstellar organisms known as Ships which were capable of superluminal travel....

When the daughter race demanded that the Tanu and Firvulag discard their ancient battle-religion and rejoin the rest of the race, a small number refused to and chose to fight a final apocalyptic war to the end. The daughter race intervened to prevent this, and so the remaining Tanu and Firvulag fled with a sympathetic Brede in her Ship into another Galaxy to fight their Nightfall war to the end. Earth was chosen as the best planet capable of supporting the lives of the two races that the Ship, now dying from the immense strain of the Intergalactic jump, could reach before its death.” – from Wikipedia article, “Saga of Pliocene Exile,” (early 1980s series by Julian May), October 29, 2018.

- ✓ If any of this sounds vaguely like Earth: Final Conflict television series (1997-2002) ... which literally ripped off the ending of The Dark Crystal (1982) as the Season 4 series finale ...

<sup>8</sup> Commentary & Citation: I remember reading a science-fiction short story about an Earth ship discovering an interstellar empire that was conquered by medieval people who boarded an alien scout ship that landed in Medieval Europe. It was a quirky and amusing idea so I remembered it, but don’t recall the author or the name of the work.

- ✓ Discovered Later: It appears that I may have read part of or something related to Poul Anderson’s novel High Crusade (1960). I know I never read the novel version, so it must have been an excerpt or summary version that was part of a sci-fi short story anthology, but I don’t know what book it was in now.

<sup>9</sup> Citation: Information taken from Wikipedia articles, “Anarchism” and “Ted Kaczynski,” December 6, 2018.

<sup>10</sup> Citation: Definitions of technology from other sources:

- ✓ Dictionary.com at *technology*:
  1. the branch of knowledge that deals with the creation and use of technical means and their interrelation with life, society, and the environment, drawing upon such subjects as industrial arts, engineering, applied science, and pure science.
  2. the application of this knowledge for practical ends.

3. the terminology of an art, science, etc.; technical nomenclature.
  4. a scientific or industrial process, invention, method, or the like.
  5. the sum of the ways in which social groups provide themselves with the material objects of their civilization.
- ✓ Collins 2012 (from Dictionary.com) at *technology*:
    1. the application of practical sciences to industry or commerce
    2. the methods, theory, and practices governing such application *a highly developed technology*
    3. the total knowledge and skills available to any human society for industry, art, science, etc.
  - ✓ American Heritage Science Dictionary (from Dictionary.com) at *technology*:
    1. The use of scientific knowledge to solve practical problems, especially in industry and commerce.
    2. The specific methods, materials, and devices used to solve practical problems.
- <sup>11</sup> Commentary: Consider this in the context of such tug-o-wars between public relations, ethics, and science as nuclear energy, human cloning, artificial reproduction, testing on lab animals, stem cells, genetic manipulation.
- <sup>12</sup> Commentary: No one should construe this as any claim that these things are actually make believe, made up, myths or any other such; if you think this is what was said here, go back and read the section again.
- <sup>13</sup> Commentary: This is not to suggest that the victims ‘deserved it,’ or that we doled out ‘divine punishment.’
- <sup>14</sup> Commentary: This falls into the vein of arguments that are unfalsifiable but irrelevant. The ancient astronauts arguments in which these things were usually appended has nothing to do with the fact that we can do them now.
- ✓ A recent example are the comments by Rep. Steven King (D-Iowa): “‘What if we went back through all the family trees and just pulled those people out that were products of rape and incest? Would there be any population of the world left if we did that?’ he said in Urbandale, Iowa, according to video posted online by the Des Moines Register, which was first to report on the remarks Wednesday.” (Clare Foran, “Steve King questions if there would be any population left if not for rape and incest,” CNN, August 15, 2019). “The remarks came as King was defending not allowing exceptions for abortion in cases of rape or incest.” *Id.* While Rep. King’s remarks may be factually unfalsifiable, it is hard to see how they are relevant to or advance the cause he was allegedly arguing: According to him we should not allow exceptions to anti-abortion laws in cases of rape or incest because no humans would be left on Earth but for rape and incest? This is not an existential issue for humanity, and suggests that no female has ever consented to sex. And that’s just for starters; women’s groups objected loudly that it legitimizes violence and exploitation of women.
- <sup>15</sup> Commentary: My grandmother lived through and witnessed some of the most momentous events in human history; she was a teen when her older brothers went off to fight in WWII (she described to me how her brother was called out to the front yard from a draft list by a mounted officer with a corporal leading extra horses). She never really talked about WWII (e.g., she may not have actually remembered Pearl Harbor) and I am not sure how much awareness she had of it in those years, but she often talked about The Depression years, her childhood.
- ✓ One day when I was young, I asked her if she remembered the moon landing. I was shocked by her response, she informed me that it never happened, that it was a Hollywood movie. Some door-to-door Jehovah’s Witnesses had got to her and convinced her that we never landed on the moon, it was all a Hollywood hoax. She seemed to think it was a movie like Planet of the Apes (which she hated). I’d heard this moon-landing-Hollywood-government cover-up conspiracy before. My grandmother said that she didn’t remember watching it on television and that she may have been working when it happened; however, she retired from Sylvania and became a housewife around 1968 and the moon landing was in 1969. She may have meant that she was in the kitchen, the television was often on when she was working in the kitchen.
  - ✓ Putting aside any of the arguments about whether or not the moon landing happened, one has to ask why some people want to believe or go about claiming that they believe we never landed on the moon? Is it perhaps that humanity must be contained to the Earth for their beliefs to work? That we must deny humanity’s greatest technical achievements to keep us in our place submissive to religion and clerical power? Is it simply an exercise in power? Do they think they gain something against the secular authority of the U.S. government or the scientific worldview by claiming that these things have been disproven as hoax, never happened? They want to dial the clock back three centuries.
- <sup>16</sup> Citation: cf. “The Duchesse d’Abrants said of the young Joséphine ‘Her teeth were frightfully bad,’ ... ‘but when her mouth was shut she gave the appearance especially at a few paces distance of a young and pretty woman.’ Because of her black teeth, Joséphine taught herself to laugh with closed lips.” – from Encyclopedia of Trivia, “Joséphine de Beau-harnais,” February 9, 2020.

*See Appendix R&D – Research & Development Example*  
*See Appendix TECH – Technology Progress*

*“Science is more than a body of knowledge, it is a way of thinking, a way of skeptically interrogating the universe.” – Carl Sagan*

**Research:** All technology (except Existential Patents purchased during set up) begins with placing a Research Piece in the Public Space. Research Pieces are received as a result of successful Research and must be immediately placed on an unoccupied Monad in the Public Space (which becomes occupied). Research represents the theoretical and experimental aspects, it represents the accumulation of experimental data and the formulation of theoretical frameworks, organization of knowledge. Development (*ut infra*) is more representative of experimental science.<sup>1</sup>

Page | 700

- ✓ Research Pieces should not be abbreviated “RPs” as that will cause confusion with Resource Points that are already abbreviated RPs throughout the rules. There were no better options, it had to be called Research because that’s what it is and there is no other sensible substitute term, and it’s a ‘piece’ because it is placed on the Public Space, e.g., Cultural Traits Pieces, and is not a star or planet from Galactic Space.
  - ✓ The Public Space is getting crowded, eh? Government Titles, Proficiencies, Aspects, Fuzzy Groups, Pathways, Research Groups, plus many bits of Galactic Space!
  - ✓ [Interview] “These two men, Schrib and Bradbury, were in many ways very similar men, you know they were both experimental physicists, and people who haven’t been around physicists possibly don’t realize how different theoretical physicists, who are the ones who do the calculations, are from the guys who actually do the hands-on experiments on the lab bench or in the field. Experimentalist are a totally different breed as far as I’ve been able to tell, often politically more conservative strangely enough, they tend to be intensely practical people. They’ve learned to think clearly about how you manipulate objects to make a certain outcome occur, whereas theoreticians are often into literature and art, often politically quite liberal; Robert Oppenheimer was perhaps an extreme example, but he was a rather neurotic man, a chain smoker, troubled in some ways, troubled certainly about who he was, you never had a sense with Bradbury or Schrib that they ever had any doubt about who they were and what was their place was in the world and how they went about doing their work.” – Richard Rhodes (author of The Making of the Atomic Bomb (1986)), The Half-Life of Genius: Physicist Raemer Schreiber (2018).
- **Research Groups:** Two Research Pieces occupying adjacent Monads at least one of which is adjacent to a *Friendly, Naturalized or Converted Colony* with an active Epistemological Constructural Element, form a Research Group. A previously-placed Research Group that is no longer adjacent to an eligible colony with an active Epistemological Constructural Element is *disrupted* (but not removed), and will not be eligible for Development actions. Research Groups are required to develop Applications. Each Research Piece belongs to a specific Research Area (see following section), that is, it represents a specific type of research. Research Groups must consist of two Research Pieces from the same Research Area.
- ✓ A new Research Piece may be placed to form a Research Group that is automatically disrupted. The wisdom of doing so may be questionable (unless paired with Cohering), like voluntarily allowing a Government Title to fail, but the rules do not prohibit positions from doing it.

*“The problem of pinning down these various entities to a nice level could imply a nice subtrope. Most Soft Sci-Fi is powered by a Large Convenient Energy Source (LCES), which in theory provides as much energy as the plot requires without refueling (‘Scotty, I need more power’). Meanwhile, since they are using magic, anti-matter, dark matter, white holes, or black holes, the theoretical power that these devices provide to our protagonists does not result in the expected megascale Dyson Spheres, ring orbitals, or space elevators. Unfortunately (or fortunately for the sake of comprehensible story telling) we relate ‘better’ to this soft Sci-Fi even though it does little to represent the actual technology needed to power replicators, transporters, shields, and artificial gravity on grand scales.”*

– from TVTropes.com, “Abusing the Kardashev Scale”

**Research Areas:** Each Research Piece or attempt must be assigned to one of ten Research Areas, which can be conceptually divided into two groups of five each. The first group is the Universal Research Concentration which consists of the Research Areas: Energy, Matter, Information, Life, and Planets. The Universal Research Concentration is knowledge which provide the *theoretical underpinnings* for the Interstellar Research Concentration consisting of the Research Areas: Stardrive, Ships, Weapons, Defenses, and Industry. The second group consists of the *engineering knowledge* that makes interstellar culture, the sinews of the galactic empire. The following general descriptions are offered for the Research Areas.

The general descriptions below are offered for concept and edification purposes, but will become more important later during the Patent process (see Patents generally, *infra*).

#### **Universal Research Concentration (Research Areas)**

- **Energy (EGY):** Research into the production, manipulation, storage, and transmission of energy. More than any other research area, Energy output is the defining reality of advanced technological civilization.
- **Matter (MTR):** Research into the material sciences, physics, chemistry, metallurgy, and engineering, the technology for turning theory into product, channeling the Energy.
- **Information (INF):** Research into the ability to collect, process and store, and communicate information, including sensors, computers, and all of the forms of media. Information is the third major component of the universe: Matter, Energy, Information.
- **Life (LIF):** Research into the biological and medical sciences, organic chemistry, and the understanding of the basic building blocks of life and evolution. Matter, energy and information combine to make life.
  - ✓ “The secrets of evolution are time and death. Time for the slow accumulation of favorable mutations and death to make room for new species.” – Carl Sagan, Cosmos, Episode 2.
- **Planets (PLN):** Research into the formation and conditions of planets, including geology, satellites, orbital mechanics, tidal forces, solar forces, meteorology, erosion, planet aging, atmospheres, and biospheres, all of the knowledge required to colonize distant planets.
  - ✓ “On whim, to pass a slow half-hour, she can command more energy than the entire nation of Portugal can spend today, and use it to launch a weekend satellite or remold a crater on the Moon.” – Frederik Pohl, “Day Million” (1966).<sup>2</sup>

**Interstellar Research Concentration (Research Areas)**

- **Stardrive** (SDR): The knowledge that allows ships to travel interstellar distances, probably at faster-than-light (FTL) speed, and also in-system propulsion systems. Stardrive is the technology that makes interstellar culture possible; a civilization may have high levels in all Research Areas, but if Stardrive has not been invented yet, they aren't going anywhere.
- **Ships** (SHP): Knowledge of starships, construction, naval architecture, orbital shipyards, ship systems, especially life support, design, and the ship as a whole unit, also Fighters, System Boats and Bases.
- **Weapons** (WEP): The design, production, and use of all weapons, including ship weapons, bombardment weapons, and planetary defense weapons to defeat enemy defenses efficiently.
  - ✓ [Interview] “The plane took off alright and the drop on was made on Hiroshima. We were so remote from the actual explosion that it was a little hard to realize the tragic loss of life which actually occurred...” – Dr. Schreiber (audio recording), 1993 Voices of the Manhattan Project by Richard Rhodes.
- **Defenses** (DEF): Development of ways in which ships and planets can be protected from opposing forces' weapons and bombardment and natural hazards.
- **Industry** (IND): Development of new manufacturing processes, new products and demands to keep Industry vital, and engineering and construction techniques.

---

*“He traveled in interstellar spaceships. In order to make a spaceship go really fast about thirty-one male and seven genetically female human beings had to do certain things, and Don was one of the thirty-one. Actually he contemplated options. This involved a lot of exposure to radiation flux – not so much from his own station in the propulsive system as in the spillover from the next stage, where a genetic female preferred selections and the subnuclear particles making the selections she preferred demolished themselves in a shower of quanta.” – Frederik Pohl, “Day Million” (1966) <sup>3</sup>*

---

**Research Action:** Research requires the activation of the Technology Power for that purpose with the use of one Act and no Scenes. Research consists of the following steps:

1. Choose Research Area (i.e. ‘select the target’),
  2. Dedicate Resources (i.e. ‘pay the money’),
  3. Resolve Research (i.e. ‘roll the dice’),
  4. Place Research Piece (if successful, do the Hokey Pokey).
- **Black Hole:** When the Technology Power is activated for the purposes of Research, the Actions sent to the Concierge must include a designation of the Research Area and a commitment of a specific amount of RPs for the Research Attempt. A position may not commit more RPs to research than they have available in the Treasury at that time. Because one Act is required to activate the Technology Power for Research, Research Attempts will be resolved before other Power Activations in the same turn that require more than one Act.
  - **Schrödinger’s Cat:** The basic chance of a successful Research Attempt is 50%. The chance of a successful Research Attempt may be influenced by many factors, chief among them being the sufficiency of the resource commitment. Prior to resolving the Research Attempt, the

Concierge will first determine if the Research Attempt is sufficiently funded via two die rolls using ten sided dice (results 0-9). For the purposes of resolving Research Attempts, “0” die roll results are zero, not 10. Enlightenment may (wisely!) be assigned to Research Attempts.

The first die roll will determine if the Research Attempt is overfunded or underfunded. The resource commitment is divided by three (fractions rounded down), and a ten-sided die is rolled. If the die roll is *less than or equal to* the resource commitment divided by three (fractions rounded down), the research is overfunded, if it is *greater than* the resource commitment divided by three (fractions rounded down), the research is considered underfunded.

The second die roll determines the extent to which the Research Attempt is over- or underfunded. The second roll on a ten sided die, is multiplied by 5% to determine the extent of the over- or underfunding.

- ✓ For example, a position commits 9 RPs to a Research Attempt. The amount is divided by three, for a result of 3. The die is rolled and the result is a “5.” Since the die roll of 5 is greater than 3, the Research Attempt is considered underfunded. A second die is rolled and the result is a “1” which is multiplied by 5%, meaning the research is underfunded by 5%. Only a “0” result on the second roll produces no effect from over/under funding.

It is irrelevant whether the Concierge shares the results of the die rolls with the position players or not; it is up to the Concierge. The die rolls are what they are (aka, the Law of Identity). The Concierge could even use an Intervention with a Special Bulletin.

- ✓ Application of Enlightenment to over- or under-funding of Research Attempts – whether it is a ‘failed die roll’ is governed by the rules in Harsh Mistress, 2 Colleges, p. 478, *supra*. Enlightenment application could make it worse on the reroll, but that’s a chance to take, and over- or under-funding rolls can exhaust Enlightenment.
- Cure for the Common Cold: The base chance of successful Research Attempt is adjusted by the previously-determined percentage by which the research is over- or underfunded. If the research is overfunded, the base chance of a successful Research Attempt is increased by that percentage; if it is underfunded, the base chance of a successful Research Attempt is decreased by that percentage. After adjustments, two ten sided dice are rolled to determine the final results of the research as a percentile. If the result is *less than or equal to* the adjusted base chance, the attempt was successful and a Research Piece is added to the Public Space.
  - ✓ Continued Example: The underfunding result of 5% means that 5% is subtracted from the base 50% chance of success for an adjusted 45% chance of success. Two ten-sided dice (2d10%) are rolled for a percentile, and the final die roll is 43%, which is less than 45%, thus the Research Attempt was successful. A Research Piece is then added to the Public Space as a result of successful Research.

The adjusted base chance of successful research is never greater than 90% or less than 5%.

- ✓ “Most business meetings involve one party elaborately suppressing a wish to shout at the other: ‘just give us the money.’” – Alain de Botton.
- Lab Assistants: Faculties may be committed to any roll related to a Technology Power activation increasing the odds of a favorable result. It may also be possible through Writs fo-

cused on the Technology Power to alter the results of Technology Power activations in various, creative ways. But all of this is added cost to get more bang for the buck (e.g., Faculties, Fuzzy Groups expended).

- ✓ The only tungsten-fast rule is that no modification should make the chance of success of any Technology Power Activation 100%; modern researchers and those who fund research know this is simply not the way nature works (within any time scale less than, say, a million years...). Any approach to 100% chance success in GGDM should be like approaching the speed of light – the universe narrows to a point and an exponentially increasing amount of effort is required to continue acceleration. And you can never quite reach it, falling just a miniscule percentage short.

Zero divided by three is still zero, so a Research Attempt with zero RPs committed, is underfunded on any result of “1” or greater on the first die roll. The second die roll determines how much, to a maximum of 45%. Thus a zero RP commitment Research Attempt might still have a minimum 5% chance to succeed (and a maximum of 50%).

- **Big Money:** Finally, the resources expended during the Research are subtracted from the position’s Treasury, *regardless of whether the research was successful or not*. The only remaining issue is to determine the amount that was expended. If the research was overfunded, the amount of the committed Resources will be reduced accordingly; if the research was underfunded, the amount of committed Resources will be increased accordingly (all fractions rounded up), and the final amount will be removed from the Treasury, even if this means that insufficient resources will be available during subsequent Power Activations in the same turn (i.e. a ‘budget shortfall’).
  - ✓ **Continued Example:** Since the previous rolls determined that the Research Attempt was underfunded by 5%, that 5% is added to the 9 RPs research commitment, for a result of 9.45 RPs. The final cost is rounded up to 10 RPs. Research in GGDM is an expensive process, balancing expediency and cost management.

If there are insufficient funds in the Treasury, half of the amount will be taken, or whatever is currently available from the Treasury, whichever is lesser, *and the remaining amount will be taken from the Treasury the next time the Technology Power is activated for any purpose*, before any further Research, Development, or Patents are processed. If the research was successful, but there are insufficient resources to pay for it, the Research will not be received until the research is fully funded (i.e. ‘paid for,’ stamped Paid in Full!).

Note that this ‘research deficit’ situation can create some interesting game situations; e.g. a position has to pay off the previous research before doing anything else. A position might activate the Technology Power after Taxation just to pour RPs into the black hole (i.e. ‘black hole research’ ☺) and/or to release previously completed Research Pieces.

- **Big Nothing:** Zero RPs commitment to a Research Attempt will never cost any RPs because adding a percentage to zero (see previous section discussion) will always be zero. So, yes, it is possible for a position to proceed through the game not paying anything for Research, but depending on the luck of the die (95% of the time the Research Attempt will be underfunded, by up to 45%) for an occasional success. Each attempt still costs an Act and a Power Activation however. Thus, astute players will never waste a Power Activation due to *lack of RPs*

and zero RP commitment to Research Attempts will never risk disturbing later Power Activations. This may be a necessity in some cases to pass Conflict Checks. There are dynamics.

- ✓ There is an interesting point for debate as to whether by ‘thinking out loud’ I am depriving the players of the ‘joy’ of the learning curve of the game; there is a certain joy of learning the complexities and discovering subtleties, efficiencies, exploitations and understanding of game rules through thinking and play experience.<sup>4</sup> But GGDM is a simulation game that exists at the limits of human complexity and the ‘joy’ of playing is equally in the holism of the game, position management and the story arc.
  - I might also, while we are on the subject, be accused of being verbose.
- **Space Race:** New fully-paid Research Pieces must be immediately placed on an unoccupied Monad in the Public Space (which is then occupied) and the positions’ Actions must contain information as to the desired placement of the Research Piece should research be successful. If this information is not provided, the Concierge will do whatever looks right and move on.
  - ✓ Research Pieces may be placed either singly or added to another Research Piece to form a Research Group; there is *no requirement* that a Research Group be formed.

More than two Research Pieces of the same type may be placed adjacent on the Public Space, there is no limit to the number of adjacent pieces or types, but exactly two Research Pieces of the same type – no more, no less – form a Research Group. It may be possible to ‘rescue’ a *disrupted* Research Group by placing a new Research Piece adjacent to both an eligible colony with an active Epistemological Constructural Element and a Research Piece from the disrupted group. This is an alternative to attempting reactivation of the inactive Constructural Elements by Cohering (see 5 Culture, p. 421, *supra*).

---

*“We will soon create intelligences greater than our own. When this happens, human history will have reached a kind of singularity, an intellectual transition as impenetrable as the knotted space-time at the center of a black hole, and the world will pass far beyond our understanding. This singularity, I believe, already haunts a number of science-fiction writers. It makes realistic extrapolation to an interstellar future impossible. To write a story set more than a century hence, one needs a nuclear war in between ... so that the world remains intelligible.”*

– Vernor Vinge, op-ed for Omni Magazine, 1983

---

**The Vinge Rule:** Nuclear war provided a plausible out, before 1945, writers would have needed something with divine implications, such as a meteor. Though I do believe that Vernor Vinge is generally correct, I would note that 20 years before his article, Frank Herbert had created a setting – Dune – that was far more than 100 years into the future and didn’t involve a nuclear war.

However, perhaps the Butlerian Jihad and the vast spatial and temporal distance provided the same overall *do-over effect* (see Foresight discussion, 2 Colleges, p. 472, *supra*), while Star Trek, of course, used some sort of global nuclear war from a conventional world war backstory as did the Mad Max series, and is perhaps to what Mr. Vinge was alluding.

- ✓ “The development of full artificial intelligence could spell the end of the human race.” – Stephen Hawking.

Herbert's Dune remains generally intelligible (if by a stretch) because despite all, the characters, the human populations, and the story contains all of the normal human drives and elements we recognize from Earth in the now – power, greed, drug addiction, men still fight for mates and money, women still generally have babies the same way, they still use psychotic drugs and religion – and all of it ties into a subconscious messianic urge for divine enlightenment.

---

*“As long as we don't program emotions into Robots, there is no reason to fear them taking over the world.” – Neil deGrasse Tyson*

---

**Deep Learning the Singularity:** This game – a product of the information revolution – makes no assumption on whether or when the Technological Singularity may occur or what the effects might be. Participants may determine that it happened before the game (e.g., Battlestar Galactica), or that it never happened, or that it happens during the game as part of the story. It may occur in conjunction with the invention of Stardrive; the two might be related. However, current predictions suggest that we are a lot closer to the Singularity event than we are to faster-than-light travel. Most science-fiction works of any kind since 1950 can be classified as pre-singularity. Because of the frightening implications of the Singularity, we have barely begun to discuss it yet. The defining point for all intelligences however, is their comprehension of and reaction to the existential void. What will the machine intelligence do when confronted with the void?

- ✓ “Humans should be worried about the threat posed by artificial intelligence.” – Bill Gates.

Deep Learning software is already beyond our understanding and opaque to us, see Will Knight article excerpt in The AI Problem, Corporations, *infra*, but is being used in rapidly increasing range of applications. Quantum computing has not yet been achieved by engineering, though Microsoft released the first Quantum Computing language in 2017. Quantum communication has been achieved and nations are using Q-Comm Satellites for security now. What happens in a decade or two when the reality of quantum computing meets deep learning? This is why many experts feel or fear that the technological singularity is only 50 years away.

Could a Deep Learning AI play GGDM? You saw this coming.

- ✓ “Instead, it relied entirely on an algorithm that had taught itself to drive by watching a human do it.” – Will Knight, “The Dark Secret at the Heart of AI,” MIT Technology Review, April 11, 2017.
  - ✓ “The car's underlying AI technology, known as deep learning, has proved very powerful at solving problems in recent years, and it has been widely deployed for tasks like image captioning, voice recognition, and language translation.” *Id.*
  - ✓ See full quote, AI Problem excerpts, Corporations, *infra*.
- **All About Toasters:** There was an interesting shift in the Cylon creation story between the original Battlestar Galactica (1978) and the reimagined series (2004). In the original series, the Cylons were created by a long extinct reptilian species (*à la* Fred Saberhagen's ‘Berserkers’); this might have been intended to explain the shiny chrome coldness of the Cylons. This was the Erich von Däniken era and the opening narration stressed extraterrestrial origins of life on Earth (or at least of humanity) to attract a certain audience (like me in my youth) and it might not have sat well with the 1970s audience if we had created the monsters that were trying to exterminate us (following the human invention of the Bomb).

In the 2004 series, a generation after the end of the Cold War, the Cylon back story was changed so that humans created the Cylons. The chrome Centurion Cylons were created by the Twelve Colonies, the Final Five were created on the original Earth (not our Earth) by the Thirteenth Tribe (Cylon tribe) that left Kobol. The Final Five also recreated the resurrection technology and biological human versions of the Cylons (the Centurion Cylons had only created hybrids). After thousands of years of sub-light travel, they made contact with the Centurion Cylons of the Twelve Colonies (who had FTL drive).

- ✓ Thus, in the end of the series, in their quest for Earth, they did find “Earth” – not the Earth of the Thirteenth Tribe, but our ‘Earth’ about 150,000 B.C. That they found Earth, but did not find Earth, and both are true, is a fuzzy sapient statement, one that machines (currently) would/might not understand.
- ✓ A short spin-off series, Caprica (2010) was created to explain the human creation of the Cylons before the series; the story is entangled in the struggles of a radical monotheistic cult (including suicide bombers) against the majority polytheism.

*“The world won’t care about your self-esteem. The world will expect you to accomplish something BEFORE you feel good about yourself.” – Bill Gates*

---

**Development:** Development is the process by which Research Groups in the Public Space become Applications on the current Era Matrix (i.e. finding something useful to do with the research), which in turn, are used for Patent Interpretations that introduce new *major* technologies into the game. Development attempts require the activation of the Technology Power for that purpose with the use of two Acts and no Scenes. Development also requires that the position currently have on its Public Space at least one Research Group, as well as, some small, variable amount of RPs in the Treasury. Each Research Piece can only be involved in one Development attempt per Regular Turn, even if part of two or more overlapping undisrupted Research Groups.

➤ Development Fund: When attempting Development, the position must specify one existing *non-disrupted* Research Group as the target of the Development. Further, the Actions sent to the Concierge must contain the locations of one or more currently open spaces on the current **Era Matrix** for the position. At the time the Actions are submitted, a number of RPs will be deducted from the position’s Treasury equal to the number of Matrix locations specified in the Actions times the current Era number *squared*.

- ✓ Example, a position chooses a non-disrupted Energy Research Group on the Public Space and specifies two open spaces (by coordinates) on the current Era Matrix to which the Energy Research Group could be Developed into an Application. The position is currently in the 1<sup>st</sup> Era. Thus the cost of the Development attempt will be just 2 RPs ( $2 \times 1^2 = 2$ ) which will be subtracted from the Treasury. If the position is currently in the 2<sup>nd</sup> Era, the cost of the Development attempt will be 8 RPs ( $2 \times 2^2 = 8$ ) and in the 3<sup>rd</sup> Era, the cost will be 18 RPs ( $2 \times 3^2 = 18$ ).

Each undisrupted Research Group may be the target of only *one* Development attempt each Regular Turn.

- The Kitty Incident:<sup>5</sup> An attempt to Develop the target Research Group will be made by the Concierge each time the position's Regular Turn Actions are processed, until either successful, or until all of the specified Matrix locations are exhausted. Each turn that the Development is not successful, the target Research Group type<sup>6</sup> (e.g., Industry Research Group, Defense Research Group) is permanently blocked from becoming an Application **at the specified Matrix location**. The next turn's Development attempt moves to the next specified Matrix location *as long as it is still open*, until all Matrix locations in the Action are exhausted.

If the Development of the Research Group into an Application fails on the first turn, Development on subsequent turns *will not require any additional activations of the Technology Power* or expenditure of additional RPs, it will be processed automatically. Development attempts will terminate if the Research Group becomes *disrupted* and will **not** restart automatically when restored. Because Enlightenment *can only be assigned to Power Activations*, there is no opportunity to add Enlightenment on the second and subsequent Development attempts. Unused Enlightenment will be returned when either it fails or is successful, see Vampire Suicide, 2 Colleges, p. 478, *supra*.

- ✓ Multiple Development attempts may be ongoing at any time as long as there is a *separate and specific Research Group assigned to each* (i.e. two Development attempts may not be made on the same Research Group in a turn). Multiple Development attempts can target the same Matrix location; if one is successful, the others following will be blocked. Development attempts will be processed in the order submitted.
- ✓ It is possible through incredibly bad luck and/or Development of other Applications at the target locations to permanently foreclose Development of a specific Research Group in the current Era Matrix. The group will again become eligible for Development in the next Era Matrix when it becomes available (see The Progress of Eras, 1 Eras, p. 759, *infra*).
- Short One Wingnut: The base chance of Development of the Research Group each turn is 50%. If there is only one remaining space on the current Era Matrix, the Development of the Research Group is automatically successful. The base chance is increased by 5% if any of the adjacent spaces contain an Application with the same Research Area. The base chance is reduced by 10% if there are no Applications adjacent to the target space on the Matrix, including instances where there are no Applications currently on the Era Matrix.
  - ✓ Thus, the base chance for Development of the first Application on an Era Matrix is 40%. Breaking into a new Era is an entire scientific revolution.
  - ✓ There is a dynamic between the number of currently open spaces on the Era Matrix, the number of spaces specified for Development of a specific Research Group, and cost and certainty of success.
- The Better Mousetrap: When the Research Group is successfully developed into an Application, it is removed from the Public Space (freeing up two Monads) and placed on the specified single space on the Matrix as an Application. All Applications on the Era Matrix occupy one space and are labeled with the Research Area from which they were Developed (e.g., Weapons Application). Applications on the Era Matrix do not have Constructural Elements.

- ✓ There is no rules provision in GGDM for removing single Research Pieces from the Public Space, only for removal of Research Groups by successful Development into Applications. There is no process for removal of Research Groups other than by successful Development. Placement of a Research Piece on the Public Space is a permanent act and a commitment to future successful Development. In some instances, Research Pieces may be moved or lost due to the need to form new Pathways (e.g., see Capital Chaos, 2 Government Titles, p. 598, *supra*) or from other necessary rearrangements of the Public Space during the game.

---

*“Cong Cao, an expert on China’s science and technology, put it more bluntly in an article he wrote: ‘When the paper bubble bursts, which will happen sooner or later, one may find that the real situation of scientific research in China probably is not that rosy.’”*

– “‘Publish or perish’ leads to fraud and paper bubbles in research,” Shanghai Daily, October 10, 2011 (authorship unattributed)

---

**Paper Bubble:** The Technology Power is not immune to entropic effects or Interventions by the Concierge during the game, but there are some careful guidelines that should be followed.

For example, it is possible to use Interventions to occasionally remove Research Pieces from the position’s Public Space on the basis of research fraud, bad data, duplication, plagiarism, etc.<sup>7</sup> However, as Applications on the Matrix are expected to represent concrete, provable, repeatable results of research applied through engineering – ultimately leading to the physical laws of the game universe – they probably cannot be removed, especially if they are part of a Patent.

And of course, Patents which are actual demonstrable technologies, probably cannot be affected by Interventions (certainly cannot be lost). In other words, short of the apocalyptic or catastrophic collapse of civilization, it is not likely that humanity will *unlearn* electronic computing, rocketry, vaccinations, aircraft, nuclear technologies, contraception, or cocaine, but the true advance of technology and science is currently perceived to be in some danger of corruption and dilution. However, there are a couple of other ways in which the Concierge can gently Intervene to apply entropic effects to Technology Power Activations short of removing existing pieces:

Inactivation of the Epistemological Constructural Element in the right places (due to social upheaval, incompetence, change in worldview locally, anti-intellectualism or anti-education) can disrupt Research Groups. The Concierge is also free to ‘embezzle’ RPs dedicated for research or adjust percentages for success through the use of Interventions. Developments and construction abilities from Patents might sometimes be unavailable for a period, representing ‘lost’ tech.

- **Dumpster Fire Alarm:** The following article is not offered to criticize China – the alarm bells have been raised in the West as well as in India (see discussion, 1 Information, bottom feature quote and EN 6, pp. 1337-1338, *infra*) – but rather because this article presents the issue most succinctly for GGDM purposes. In fact, this article suggests that a well-funded Technology College or activation of Technology Power Writs in GGDM may serve to aggravate systemic problems almost as much as it helps the position advance in technology. That is, the systems created by or for the technological and scientific advancement of humanity have become a drag on the very endeavor. Within every process lie the seeds of its demise (echoing Dean Inge, 5 Government Titles, p. 641, *supra*). Where do we find the proper balance?

- ✓ “Editor’s note: How can China become an innovative country when many professionals are judged not by their real accomplishments but by their output of papers? The following Xinhua article identifies one of the biggest hurdles to innovation: blind worship of academic publishing – the more the better.

[Article begins] AS China’s economy has soared to the second place in the world, the country’s scientific strength has also surged – if only measured by the numbers. Chinese researchers published more than 1.2 million papers from 2006 to 2010 – second only to the United States but well ahead of Britain, Germany and Japan, according to data recently published by Elsevier, a leading international scientific publisher and data provider. This figure represents a 14 percent increase over the period from 2005 to 2009. The number of published academic papers in science and technology is often seen as a gauge of national scientific prowess. But these impressive numbers mask an uncomfortable fact: most of these papers are of low quality or have little impact. ...

China’s CPA [Citations per Article] dropped ... for the period from 2005 to 2009, and is now below emerging countries such as India and Brazil. Among papers lead-authored by Chinese researchers, most citations were by domestic peers and, in many cases, were self-citations. ‘While quantity is an important indicator because it gives a sense of scientific capacity and the overall level of scientific activity in any particular field, citations are the primary indicator of overall scientific impact,’ said Daniel Calto, Director of SciVal Solutions at Elsevier North America. Calto attributed China’s low CPA to a ‘dilution effect.’ ‘When the rise in the number of publications is so rapid, as it has been in China – increasing quantity does not necessarily imply an overall increase in quality,’ said Calto.

‘Chinese researchers are too obsessed with SCI (Science Citation Index), churning out too many articles of low quality,’ said Mu Rongping, director-general of the Institute of Policy and Management at the Chinese Academy of Sciences, China’s major think tank. SCI is one of the databases used by Chinese researchers to look-up their citation performance. The alternative, Scopus, provides a wider coverage worldwide. ‘Chinese researchers from a wide range of areas and institutions are vying for publication, as it is a key criterion for academic appraisal in China, if not the only one. As a result, the growth of quality pales in comparison to that of quantity,’ said Mu, an expert on China’s national science policy and competitiveness.

On the other hand, China also falls behind the United States in multidisciplinary research, which is a core engine for scientific advance and research excellence. From 2006 to 2010, China published 1,229,706 papers while the United States churned out 2,082,733. According to a new metric introduced by Elsevier’s Spotlight research assessment solution, China generated 885 competencies while the United States had 1,817. In other words, China’s total research output is more than half that of the United States, while the number of competencies showing China’s strength in multidisciplinary research is less than half that of the United States. Cong Cao, an expert on China’s science and technology, put it more bluntly in an article he wrote: ‘When the paper bubble bursts, which will happen sooner or later, one may find that the real situation of scientific research in China probably is not that rosy.’ – ‘‘Publish or perish’ leads to fraud and paper bubbles in research,’’ Shanghai Daily, October 10, 2011 (authorship unattributed) (available free online).

GGDM is my only ‘paper’ so far, and no one would mistake it for ‘research.’

**Russian Ambassador:** *Cobalt thorium G has a radioactive half-life of ninety three years. If you take, say, fifty H-bombs in the hundred megaton range and jacket them with cobalt thorium G, when they are exploded they will produce a doomsday shroud. A lethal cloud of radioactivity which will encircle the Earth for ninety three years!*

**President Muffley:** *I'm afraid I don't understand something. Is the Premier threatening to explode this if our planes carry out their attack?*

**Russian Ambassador:** *No sir. It is not a thing a sane man would do. The doomsday machine is designed to trigger itself automatically.*

– Dr. Strangelove (1964)

## Endnotes.

<sup>1</sup> Citation: “What is happening, you ask? Well, nothing. We have not made progress for 40 years. The problems we are trying to solve today are the same problems we were trying to solve half a century ago. This worries me because if we do not make progress understanding nature on the most fundamental level, then scientific progress will eventually be reduced to working out details of applications of what we already know. This means that overall societal progress depends crucially on progress in the foundations of physics more so than any other discipline. I know that a lot of scientists in other disciplines find that tremendously offensive, but if they object, all I have to do is remind them that without progress in the foundations of physics, there would be no transistors, no microchips, no hard disks, no computers, no wi-fi, no internet; there would be no artificial intelligence, no lasers, no magnetic resonance imaging, no electron microscopes, no digital cameras, computer science would not exist, modern medicine would not exist either because the imaging methods and tools for data analysis would never have been invented. In brief, without the work that physicist did 100 years ago, modern civilization as we know it today would not exist.” – Sabine Hossenfelder, “Physics is still in crisis,” Sabine Hossenfelder YouTube Channel, June 5, 2020.

<sup>2</sup> Citation: A fantastic video made from the author’s reading of “Day Million” is available on YouTube at <https://www.youtube.com/watch?v=ec7SJy26tLA>.

<sup>3</sup> Commentary: I wonder if Frederik Pohl’s “Day Million” (1966) is related to Zager & Evans “In the Year 2525” (1968)? The song was written in 1964, so it predates “Day Million” publication by two years.

<sup>4</sup> Commentary: Long ago, I participated as a player in, and assisted in the late design of a free PBEM game called Empire Forge. I created a FAQ page that was eventually 200 questions long clarifying the rules and operation of the game program, I also created a Ringer Board page, a Pink Floyd inspired short story and a background mythology, “Mythology of the Maj.” I noticed as a result that over time, new players coming into the game were playing it at a higher level in shorter time than when I had begun the game. Unfortunately, it didn’t go well when I suggested re-writing the rules; no set of game rules should have 200 FAQ.

- ✓ Similarly, in one afternoon, two friends and I played three consecutive games of the steampunk time-travel board game Khronos. We each won one game. But each game played became progressively more complex and longer as our calculations of ripple effects, building placement, and resource management deepened. It was an extraordinary phenomena to witness. Deep Learning in humans.

<sup>5</sup> Citation: Reference to an old television commercial where the cat on the lab table knocked over some beakers of chemicals and the scientist found the mess the next morning on the floor and ‘discovered’ plastic.

<sup>6</sup> Clarification: Thus, because a Research Group is made of two Research Pieces of the same type, a ‘blocked’ location on the Matrix cannot be unblocked by simply shifting to another Research Group of the same type. This prevents having to track which individual Research Groups have been blocked or having players making shifty moves with overlapping Research Groups to get around the blocked Matrix location. Blockage of Research Group ‘types’ solves the issue in a broad stroke. The blocked Research Group types must be displayed for the players to know.

<sup>7</sup> Commentary & Citation: “You copy from one book, it’s plagiarism, if you copy from 100 books, it’s research.”

- ✓ There are many variations of this on the internet attributed to several different authors and has a long history, see <https://quoteinvestigator.com/2010/09/20/plagiarism/>.

*See Appendix EPATI – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*  
*See Appendix TECH – Technology Progress*

*“Imagine Knut decides to take a sip of coffee from the mug next to his right hand. He does not even have to think about how to do this. This is not because the situation itself is trivial (a robot capable of recognising the mug, deciding whether it is full, then grabbing it and moving it to Knut’s mouth would be a highly complex machine) but because in the context of all possible situations it is so trivial that it no longer is a problem our consciousness needs to be bothered with.”*

– Wiki e-book: [Cognitive Psychology and Cognitive Neuroscience, Problem Solving from an Evolutionary Perspective](#) (2011) <sup>1</sup>

**Triviality:** Within GGDM, ‘looking’ is non-trivial. This is probably not, and cannot be, true of the universe in general. Trivialness probably depends on consciousness.

- ✓ For example, I have grown very tired of always ending up in the wrong universe, the one where for each opportunity, in any situation or task, out of all of the possibilities, I end up in the universe where the petty, annoying and utterly stupid little thing always goes wrong, just for the purpose of annoying me. It’s truly amazing how consistently trivialness happens in our daily lives.

*“Reverse engineering has its origins in the analysis of hardware for commercial or military advantage. However, the reverse engineering process, as such, is not concerned with creating a copy or changing the artifact in some way; it is only an analysis in order to deduce design features from products with little or no additional knowledge about the procedures involved in their original production.”*

– from Wikipedia article, “Reverse Engineering,” captured October 23, 2019

**Reverse Engineering:** Thus, in reverse engineering, we are not trying to create an exact duplicate of Damascus Steel or an A7V tank from WWI – except perhaps to demonstrate that our analysis is correct – but rather to discover the features, abilities, and knowledge behind the design and construction. In the case of artifacts, whether alien or historical, it may be impossible or undesirable to produce an exact copy of the artifact.<sup>2</sup>

- ✓ This is an example of how Wikipedia quotes are used in GGDM; this quote helped frame the reverse engineering rules in the game design. That is, Reverse Engineering in GGDM will not allow a position to duplicate another position’s Patent or make copies without having the Patent. When the Allies captured German A7V tanks in 1918, they examined them, but not for the purpose of making copies.
- ✓ In 1976, Viktor Belenko defected to the West from the Soviet Union by flying his MiG-25 Foxbat and landing in Hokodate, Japan. The combat jet was disassembled, fully examined and tested, then returned to the Soviet Union in crates aboard a freighter and Japan presented a bill to the Soviet Union for damage to the airfield, crating and transport. The MiG-25 was an aircraft whose purpose and abilities were largely unknown to the West; it turned out to be a high-altitude interceptor not a fighter-bomber as originally believed (it had some kick, but not much punch!). The West was not trying to make their own copies of the MiG-25, but rather to make

training simulators of the MiG-25 and it is not likely that the West obtained any technology from the MiG-25 that they did not already have, the MiG-25 was borderline obsolete by the time it entered service.<sup>3</sup>

- De-conjunction Junction: Activation of the Technology Power for the purpose of Reverse Engineering is an attempt to find out how an alien technology works so that it can be used or adapted to the position's technology. The Technology Power Activation costs only a Scene at the location to be examined, no Acts are used, perhaps representing plausible deniability.<sup>4</sup>
  - ✓ If the junk is floating in system space, the Scene must be on the star, if not, then it must be on the planet location.

Deconstructing an alien technology requires two basic parts: The opportunity to view or have the alien technology for study, and second, the not inconsequential task of figuring out what it does and how it works.

- ✓ The 'opportunity' may also come as a result of successful Special Operations, *infra*, e.g., the insane Operation Wildhorn III, July 25, 1944 to steal V-2 rocket parts. During the Cold War, in 1988 the US stole a crashed Soviet Mi-25 Hind-D helicopter located in Chad, and the Soviets tried to snatch an American F-86 Sabre in 1951.

The latter difficulty includes, but is not limited to, different basis for the technology, alien writing and counting systems, possible differences in Eras (Would a medieval person be able to reverse engineer a telephone? Even if they had one?), the fact that the object may be part of a system and have no standalone function, that the object may be inconsequential, and not the least – the fact that it's alien.<sup>5</sup>

- ✓ For example, a computer keyboard is a wonderful artifact – I have many, most of them don't work (cat barfed on one, tea cup spilled on another...). The keyboard is useless without being attached to a computer, and my laptop is useless now because of a dead keyboard. Without our language and counting systems, and the concept of writing – e.g., consider a Japanese keyboard, we know what a keyboard is and does, but without the proper computers and knowledge of Japanese language, it's useless to have one. Maybe an archaeologist will find my house and a trove of dead keyboards.
  - ✓ For example, that the object may be a toy – some alien brat left its favorite toy behind and its parents had to endure the long flight with bratty pouting and whining in the backseat all the way home to Betelgeuse.
  - ✓ Not to mention schematic and mapping systems. We were told in military school that we would not be able to use Soviet maps, not only because of the different alphabet, but also because their longitude zero runs through Moscow instead of Greenwich. In the last couple of years, the full and stunning extent of the Soviet military mapping obsession has been revealed and discussed in second tier media in the West.
- Roman Numerals Again: The Roman numerals were an additive system and we understand them because they were preserved and continued some use after the introduction of the positional notation Hindu-Arabic numeral system. What if they were alien, or if Roman culture, like the Hittites, had been erased from history, and we had no cross references, no clues that they were numbers?

- ✓ “Much of the world, including Europe, also lacked an efficient numbering system such as that developed in the Hindu and Arabic cultures. (Try long division, for example, using Roman numerals.)” – Jon Davidson, “What is Calculus,” Southern State Community College (Ohio), undated article.
  - See also discussion of Roman Numerals in Symbols & Abstractions, 1 Beginnings, p. 29, and EN 8, p. 33, *supra*.

Any numeral system – whether tally or place notation – has a base cycle, for example, in the current world, the cycle is 10, the numbers run from 1 to 10, and then after 10, the next number is  $(10 + 1 =) 11$  through to 20, and so on. If a species only had 8 digits, their counting system might cycle in eights (octal), that is, 0-7 and the next number after 7 would still be 11, but there would be no 8, 9 or 10, 18, 19 or 20 and so on. And the development of zero in our *place notation* counting was a 500 year process; zero was originally nothing and had no symbol or at least, no mathematical operation. Zero is necessary for development of computers, but in all cases it is likely a late development added to an already existing numeral system.<sup>6</sup>

- ✓ In Episode 1 of the Japanese language (with English subtitles) tiaga drama Yae’s Sukara (2013), the master of the ‘artillery’ school in Edo in about 1853, rather than being concerned about ‘shooting cannons,’ instead stressed learning to read Dutch so that they could learn ‘Western arithmetic, science, military and medicine’ with the goal that Japan could build anything the Westerners could if they understood how. Thus, the key to figuring out an alien technology is as much likely in figuring out their language (especially if they left the manuals behind) than in understanding the basis of the technology; the Stargate series cheated on this issue because the aliens were using scripts known from ancient Earth (more precisely, that they had introduced to ancient Earth) to which some modern concepts were added, such as the numeral zero.
- **Alien Artifact:** When the Technology Power is activated for the purpose of Reverse Engineering the Scene must be at the location of the proposed Reverse Engineering attempt. The position’s Regular Turn Actions must describe in sufficient detail the specific alien physical object or colony and the level of contact with the target alien object or colony. Finally, the Action must describe the objective (or ‘sub-purpose’) of the Reverse Engineering as either Xeno-archeology, Alien Patent or Alien Stardrive.
- ✓ Alien Stardrive objective requires possession of a reasonably intact alien starship (e.g., ‘flying saucer’), and is a slightly different procedure described separately below.
  - ✓ For the purposes of Reverse Engineering in GGDM, Xeno-archeology is not limited to ‘dead worlds’ or ancient civilizations; it broadly encompasses physical examination of all alien technologies, including on current ‘living worlds’ controlled by the position.
- Previously colonized worlds can count as colonies for Reverse Engineering purposes; for example, see designated Special Planets which are former **alien colonies**, Resources from Special Planets, 2 Taxation & Census, p. 307, *supra*.
- ✓ There are a limited number of Reverse Engineering opportunities at each site or for each artifact (*ut infra*), and thus, the position players should be cognizant and choose

carefully for their needs, does the position need Research Pieces or a connections between Applications? Or is Era Progression and as shiny new Stardrive Patent more important?

- ✓ The card game Race for the Galaxy features prominently cards relating to discovery of alien ships and worlds with ruins (especially the Alien Rosetta Stone world), and the emergent “six drop” (a player term) development card called the Alien Tech Institute. In the Babylon 5 universe, there is an Earth-government related xeno-archeology corporation, Interplanetary Expeditions, which is in the business of mining alien technology for profit. Their slogan is “Exploring the past to make a better future,” though in another view, they are opportunistic scavengers of dead worlds. Within the framework of GGDM, it is likely possible to create Colleges, Institutes and/or Corporations relating to reverse engineering alien technology.
  - Organizations are *individual effectiveness multipliers*. Had Raemer Schreiber, Enrico Fermi, or Robert Oppenheimer been soldiers on the front lines – a man with a gun among thousands – they would not have invented the atomic bomb and nuclear power. The resources and commitment of the U.S. government at war placed them together at Los Alamos.
- Champollion: The starting point to resolve all Reverse Engineering activations of the Technology Power is a judgment by the Concierge – quantified in a number from 1 to 9 – of the ‘Quality of the Contact’ with the proposed alien object or colony. A value of ‘1’ represents very weak contact – such as a fleeting glimpse of a UFO – while a value of ‘9’ represents the best quality of contact, such as possession of an undamaged major alien artifact at a urbanized colony, or a colony on a planet containing the remains of a previous alien civilization. Other factors may, at the judgment of the Concierge, include whether or not First Contact has been made with the (former) alien owners (in some cases, they are extinct in the playing area), length of contact, whether **alien colonies** have been Conquered, Converted or Naturalized, and whether Diplomatic Spaces or Shared Meanings exist with the alien originators. Establishing a Specialized Colony for that purpose at the location of a dead/abandoned **alien colony** is a major effort by the position, and Colleges may also be considered. Reverse Engineered alien technology may also be important or even critical to the story of the game.
 

The position will not be informed ahead of time (and players should not ask) what the Concierge might consider the Quality of Contact for any situation or what factors may be considered; there will be no pre-discussion or arrangements or prejudgment opinions issued.

  - ✓ One example of the problems merging human and alien technologies into a working system is the television show, Star Trek: Deep Space Nine. Chief Engineer O’Brien comments on it several times during the show.
  - ✓ The Quality of Contact judgment by the Concierge is extremely important to all Reverse Engineering attempts. It should not be treated randomly, the Concierge should not abdicate their responsibility to a die roll when one is not dictated by the rules.
- Tourist Attraction: The attractions of Reverse Engineering alien technology ranges from the possibility of a cheap tech boost from someone else’s research to necessity when confronted with possibly superior alien military technology (in the real world, it is called Technical Intelligence, or TechInt, a prominent feature of the Cold War). Either way, it costs RPs. The position’s Turn Actions must include, as with regular Research attempts, a number of RPs

committed to the Reverse Engineering attempt, which will be immediately subtracted from the position's Treasury (this amount will not be modified as in regular Research attempts). Note that with a cost of *no Acts and one Scene*, Reverse Engineering attempts will normally be processed before Actions costing just one Act (see Appendix PAT2).

- ✓ The first two Spitfires owned by the predecessor to the Israeli Air Force were assembled from junk – leftover parts from the British Royal Air Force and parts salvaged from downed Royal Egyptian Air Force Spitfires. They were test flown in July and October 1948 and entered service. The intriguing possibility of reassembling and using alien vehicles is not directly addressed in Reverse Engineering (it would be very difficult, considering they are of alien origin, not like Spitfires). But if this were desired in the game, the Concierge could substitute receipt of an alien ship for normal results of Reverse Engineering plus some risk of loss on the first flight.
  - ✓ The best technical intelligence agency in the world is Jane's Information Group (aka, "Jane's") whose books were frequently referenced in my intelligence section during field training exercises, instead of the embark box full of dusty military field manuals that we had to bring along for show: We had an embark box full of technical manuals and a backpack full of Jane's. And a lot of pogeey bait.
- Alien Prometheus: The essence of reverse engineering is the engineering, not the technology, though some relationship of understanding must exist between the two. Technology Power activations in GGDM encompass technology and engineering as a whole process.

Reverse Engineering attempts for the purpose of 'Xeno-archeology' seek to gain Research Pieces, which are placed on the Public Space, and may sometimes result instead in a new Application placed on the Matrix (i.e. a Development). These attempts are resolved like normal Research Attempts (see 2 Technology, p. 702 *et seq.*, *supra*) with the following differences:

- ✓ No Research Area is chosen for Reverse Engineering attempts, if the attempt is successful, the Research Area is determined randomly (or by Concierge judgment).
- ✓ The *base chance* of success is 5% x the Quality of Contact modifier determined by the Concierge, which produces a base chance range of between 5% and 45%.
- ✓ The RPs committed to the Reverse Engineering attempt are divided by four instead of three, and the attempt is overfunded if the second die roll is less than (rather than less than or equal to) the RPs divided by four. Otherwise, it is underfunded; there is a greater chance of underfunding in Reverse Engineering attempts than normal research.
- ✓ The chance of success of a Reverse Engineering attempt is the base chance plus or minus the over- or under-funding percentage, just like a normal Research Attempt.

Finally, for each successful Reverse Engineering attempt for the purpose of Xeno-archeology, there is a chance equal to the Quality of Contact assigned by the Concierge that a Development will be received on the Matrix instead of a Research Piece on the Public Space. This creates an 'exponential' effect for the Quality of Contact assigned by the Concierge, as it both influences the chances of success and the chances of obtaining an alien Application instead and careful judgment should be exercised. The Application will be received when the research is fully paid, in cases of underfunding and insufficient RPs in the Treasury. The Application received will be either one listed on the Patent of the alien item being examined, or

randomly determined (e.g., for an abandoned alien world) and it will be placed in a randomly determined open location on the Matrix but not connected (see Patent Prosecution, 3 Patents, p. 747, *infra*). The Concierge can also substitute judgment based on what is being examined.

- ✓ The question of a Reverse Engineering attempt is not so much whether, given enough time (considering the time represented by a GGDM Regular Turn) they can ‘figure it out’ but rather, whether or not there is anything useful to be gleaned from what is being examined? Returning to Damascus Steel for example (or even Greek Fire), the curiosity is mostly historical; ‘rediscovery’ will likely not add much to our current technology as our current technology is vastly superior overall to ancient technology.
  - ✓ Reverse Engineering attempts, by their nature, provide many opportunities for creative Concierge use of Interventions. As I am sure you can imagine... Terminator 2 (1991) is the result of reverse engineering future technology leftover from the first movie and competing time-travelling interventions, but the whole franchise was rather careless about temporal paradoxes. Who needs intellectual stuff like temporal paradoxes when you have Schwarzenegger?
  - ✓ [Interview] “Someone who assembled the weapon – it might have been Schreiber, I don’t recall – remembered that when the whole thing was supposedly finished, he noticed that some of the wires were reversed and stayed up all night reversing them back the way they were supposed to be or the thing might not have worked at all. And it was General Groves’ horror that the bomb might not work, the material would land on the ground and the Japanese would sweep it all up and use it to make a bomb themselves, not a very likely scenario, but General Groves worried a lot about making sure these things actually worked when and how they were supposed to work.” – Richard Rhodes (author of The Making of the Atomic Bomb (1986)), The Half-Life of Genius: Physicist Raemer Schreiber (2018).
- Itsappe Who Stole Fire: Prometheus stole fire from the Titans to give to man (Ancient Greek tale), Itsappe (coyote in the Shoshone tale) stole fire from the humans for the animals.<sup>7</sup>

Reverse Engineering with the objective of ‘Alien Patent,’ if successful, will result in one random connection being established on the Matrix between two Applications are adjacent on the Matrix and not currently connected. There does not have to be an actual alien Patent.

- ✓ It’s sort of like, ‘Gee, I didn’t know the safety match tip and the friction strip on the match pack were connected!’<sup>8</sup>☺

The mirroring requirements plus the chances of success make ‘Alien Patent’ a long shot, but an established connection can be very beneficial in terms of several potential future Patent Prosecutions (see 3 Patents, p. 747, *infra*) and Era progression (see 1 Eras, p. 759, *infra*). The process does not directly lead to copying of or obtaining the Alien Patent.

- ✓ A Reverse Engineering attempt for the purpose of Alien Patent costs 1 RP.
- ✓ The chance of success of the Reverse Engineering attempt is equal to the Quality of Contact expressed as a percentage, that is, from 1% to 9%.

If successful, a connection will be established between two Applications currently on the Matrix as described above. If there are multiple possible connections, one will be chosen randomly (meaning there is likely little reason for the Concierge to exercise judgment on this).

- ✓ The business card read, “Wile E. Coyote, Super Genius. Have brain. Will travel.”

*“Lazar said that his job was to help with the reverse engineering of one of nine flying saucers, which he alleged were extraterrestrial in origin. Lazar claims one of the flying saucers, the one he coined the ‘Sport Model,’ was manufactured out of a metallic substance similar in appearance and touch to stainless steel. In a subsequent interview that November, Lazar appeared unmasked and under his own name.*

*Lazar claimed that the propulsion of the studied vehicle was fueled by the chemical element with atomic number 115, or ‘E115’ (which in the 1980s was presumed to exist but had not yet been artificially created; it was first synthesized in 2003 and later named moscovium). Lazar explained that the propulsion system relied on a stable isotope of E115, which he explained generates a gravity wave that allowed the vehicle to fly and to evade visual detection by bending light around it. No stable isotopes of moscovium have yet been synthesized; all have proven extremely radioactive, decaying in a few hundred milliseconds.”*

– from Wikipedia article, “Bob Lazar,” captured October 23, 2019

**Flying Saucers:** Stardrive Patents are different from regular Patents in GGDM, as will be explained in the Stardrive sections, *infra*. If the Reverse Engineering purpose is ‘Alien Stardrive’ – one of which must be present e.g., from a crashed or captured alien ship, and the reverse engineering attempt is successful on the same Regular Turn as an attempt is made to prosecute a new Stardrive Patent, the chance of success of the latter is increased by 5-15%. That is, rather than possibly receiving a Research Piece (or Application) or a connection between Applications on the Matrix, Reverse Engineering of the Alien Stardrive may result in improvement of a chance to successfully develop a new Stardrive on the same Regular Turn.

- ✓ Norman Spinrad’s Second Starfaring Age (The Void Captain’s Tale (1983), Child of Fortune (1985)) was kicked off by the reverse engineering of the alien Jump Circuit from abandoned colonies of We Who Have Gone Before.

As described in Event Horizon, 1 Eras, p. 760, *infra*, development of a new Stardrive is critical to advancement out of the 1<sup>st</sup> Era, so this could be very important to the position. To obtain this possible effect of Reverse Engineering an alien stardrive requires two activations of the Technology Power on the same Regular Turn, and the Reverse Engineering attempt will resolve first.

- ✓ This effect cannot be obtained if 1) the ship being examined had a Generic Stardrive (GSD, see 2 Stardrive, p. 791, *infra*) and 2) the position attempting the Reverse Engineering already has the Generic Stardrive (GSD) Existential Patent. In these cases, the Reverse Engineering attempt will be converted to Xeno-archeology and resolved accordingly (as the position may not know in advance what sort of Stardrive was on the ship being examined, and this is a risk), and will have no effect on Stardrive Patent prosecution.
- ✓ This process does not allow improvements in Ship Speed of the Generic Stardrive (or any other Stardrive) through Continuous Operational Technology (COT) Patents (see 2 Patents, p. 740, *infra*), it only applies to prosecution of a new Stardrive Patent as described in Stardrive Patent Prosecution, 2 Stardrive, p. 796, *infra*.

- E115: The chance of success in Reverse Engineering an Alien Stardrive is the Quality of Contact (QOC) number determined by the Concierge plus the Current Era of the position.

This means that the range of probabilities is from 2% to 11% (QOC 1-9% plus 1-2% for 1<sup>st</sup> or 2<sup>nd</sup> Era, min 2%, max 11%); it is unlikely unless the 4<sup>th</sup> Era is opened in the game (optional), that a 3<sup>rd</sup> Era position will attempt to Reverse Engineer an Alien Stardrive.

- ✓ The percentages range from a 1<sup>st</sup> Era position looking at a totally smashed alien ship trying to figure out how it goes (2%) to a 2<sup>nd</sup> Era position examining an intact alien ship (11%).

The attempt also costs 3 RPs from the Treasury.

- ✓ This, like many other Power Activations in GGDM is a risk-cost-benefit evaluation. For the cost of a Technology Power Activation, a Scene and 3 RPs, the position has a 2-11% chance of getting a one-time bonus, usable on the same Regular Turn that it also tries to prosecute a new Stardrive Patent. But success could significantly alter the development trajectory of the position and possibly the game!<sup>9</sup>

Upon a successful Reverse Engineering of an Alien Stardrive, the bonus of 5-15% to concurrent Stardrive Patent Prosecution on the same Regular Turn is randomly determined and applied. The position does not need to know the bonus received, only that they successfully Reverse Engineered the Alien Stardrive. Each type (that is, the type of Stardrive on the ship, each ship can have only one type) of Alien Stardrive may only be Reverse Engineered once.

- ✓ As an aside, a Minor Race (pre-1<sup>st</sup> Era) would have a 1-9% chance of figuring out the flying saucers they captured, if the government can surreptitiously budget (over say, 50 years or a century) the 3 RPs without the taxpayers noticing.
- Alien Tourist Trap: It is suggested that each major alien object or general location (i.e. Special Planet) may be the subject of a limited number of Reverse Engineering attempts by a single position. That is, a position should not be able to ‘milk’ or ‘mine’ one find for the entire game; the find should be investigated and *then civilization moves on*, whether or not anything was gained from the investigation. Any continuing research at the site is subsumed under normal Research and Development rules described in 2 Technology generally, *supra*, without specific reference to xeno-archeology. How many attempts are allowed for each site or object is at the judgment of the Concierge, but an entire dead/abandoned alien planetary civilization should not merit more than three Reverse Engineering attempts (in one to three consecutive Regular Turns), perhaps one of each objective (i.e. Xeno-archeology, Alien Patent, Alien Stardrive) while a single crashed alien ship should get only one attempt of any type.
  - ✓ The Concierge, through use of an Intervention, *may* change the initially set Quality of Contact modifier on the second and third Reverse Engineering attempts at the same location; e.g., the researchers may do damage through carelessness or lack of understanding, thereby reducing the chances of success, or they may improve chances through diligent, careful, considered analysis. This should be done for story purposes and the Concierge should prudently avoid doing it to solely ‘level up’ ‘reward’ or ‘punish’ a position; it could also be handled completely randomly by a computer assistant, though that sort of defeats the purpose of having a human Concierge and disregards the possible effects of Colleges and positional commitment to technology.

- ✓ Reverse Engineering attempts could be made at the location of Conquered **alien colonies** or **alien colonies** of other Native Population Types in the game that have recently been abandoned or obliterated. This very much affects the Concierge judgment of quality of the contact (the scale of 1-9, *ut supra*); a Conquered Colony, intact, will rate high on the scale, whereas, there might not be much left to find if the subject colony has been largely obliterated before surrender or being forcibly Balkanized.<sup>10</sup>
  - See also Xenobiology discussion, 1 Information, p. 1333, *infra*.
- ✓ Reverse Engineering should not be confused with scavenging, e.g., the main lead characters at the beginning of the TV series *Defiance* (2013-2015) were scavengers looking to make it rich quick in a mostly lawless wasteland. However, if the participants like, scavengers could be the source of alien junk at a location to be used in Reverse Engineering attempts. Scavengers could have a major effect on the game even.
- ✓ There is a *blurry continuum* from scavenging to intelligence to reverse engineering, e.g., Project Azorian attempting to recover Soviet submarine K-129 in 1974, to which Howard Hughes lent plausible deniability (see 3 Special Operations, p. 1314, *infra*).

---

*“Man the maker looks at his world and says ‘So who made this then?’ Who made this? – you can see why it’s a treacherous question. Early man thinks, ‘Well, because there’s only one sort of being I know about who makes things, whoever made all this must therefore be a much bigger, much more powerful and necessarily invisible, one of me and because I tend to be the strong one who does all the stuff, he’s probably male.’ And so we have the idea of a god. Then, because when we make things we do it with the intention of doing something with them, early man asks himself, ‘If he made it, what did he make it for?’ Now the real trap springs, because early man is thinking, ‘This world fits me very well. Here are all these things that support me and feed me and look after me; yes, this world fits me nicely’ and he reaches the inescapable conclusion that whoever made it, made it for him.”*

– Douglas Adams, “Is there an Artificial God?” speech at Digital Biota 2, Cambridge U.K., September 1998 (transcript and audio recording of the more than one hour speech are available free at <http://www.biota.org/people/douglasadams/>)

---

**Children & Puddles:** This is probably how children see the world, and how my cats – if they ever wondered why – would think of their heated cat houses and food dishes. What Mr. Adams is speaking about is a simple acceptance of existence. Like a cat or child. But the child grows up, and the cat doesn’t.

- ✓ See also In Our Puddle, 1 Entropy, pp. 231-232, *supra*, for Douglas Adams’ ‘puddle’ story.
- ✓ See further Mythopoeic Thinking discussion, 1 Temporal Technology, p. 809, *infra*.

---

[Interview] *“The discovery of nuclear fission was like the discovery of fire. It was the first major form of energy that does not depend upon, ultimately, the sun.”*

– Richard Rhodes (author of *The Making of the Atomic Bomb* (1986)), *The Half-Life of Genius: Physicist Raemer Schreiber* (2018)

---

**The Secret of Fire:** There was a debate in the latter half of the 20<sup>th</sup> Century about when human ancestors (not necessarily beings we would call human) discovered or gained the controlled use of fire. This is not an issue as simple as it sounds, for there is a difference between having controlled use of fire obtained and preserved from natural sources, and the ability to make a fire.

The one fact that was clear throughout was that human ancestors had the ability to keep and control fire for far longer than they had the ability to make fire – our ancestors probably obtained fire first from lightning strikes on trees and other burnable materials, or from carrying burnable materials up to volcanic vents. Fire was so important that the story of how humans obtained fire was embedded in every religion from the time that creation myths began; many Native American myths describe a wolf bringing fire down from the heavens or a volcano as a gift to humans.

The secret of fire is this: That human ancestors had fire – and overcame the animal’s instinctive fear of fire – for a long enough time that it profoundly affected our evolution. Some estimates place the advent of controlled use of fire back as far as 750,000 years ago, based on evidence found in caves at Zhoudoukian (i.e. The Peking Man, *Homo erectus pekinensis*). Most scholarly analysis accepts that human ancestors had control of fire – if not the ability to make fire – at least 400,000 years ago.

- ✓ One can imagine back around 1 million B.C.E. a persecuted weird doomsday cult that wore body covering and insisted on cooking all foods, and who predicted the demise of all who didn’t follow their way...

The benefits of the controlled use of fire are easily extolled in their obviousness; they include warmth, light, protection from predators and winter, the ability to expand to new living areas, pottery, heat-bending wood and hardening wooden spear points.

- ✓ “Evidence for life in caves is abundant, and Mousterians must have occupied them extensively. Windbreaks of poles and skin were probably erected at the cave mouth for protection against the weather. Fire is in general use by this time of course, and no doubt used for cooking, for warmth, and for keeping dangerous animals at bay.” – Jurmain, Nelson & Turnbaugh, Understanding Physical Anthropology and Archeology, 3<sup>rd</sup> Ed., 1987, p. 437.

Fire light probably was a major contributing factor to the rise of storytelling (e.g., cave paintings), legends, early religion, and mysticism. Fire was the first god that humans could touch.

- ✓ “We mentioned earlier Peking Man’s practice of cutting away the base of a human skull to remove the brain. Deep in the Guattari Cave, sixty miles south of Rome, Neanderthals performed a similar ritual. Explorers found a human skull – the right side crushed and the foramen magnum area cut out – in the center of a circle of stones. Near the circle were several piles of deer, cattle, and pig bones. Apparently, the man had been killed (sacrificed?) outside the cave, by a smashing blow to the right side of his head. His head was taken into the cave and placed within the circle of bones. What is the meaning of this remarkable activity? For the first time in human history, we find people who are concerned with more than the material aspects of life. Deliberately burying a corpse and depositing objects that belonged to him alongside his body reflects attitudes and values different from the ordinary. Death had meaning, perhaps mystical, something unknown, and Neanderthals recognized that they had to come to terms with what they didn’t understand.” – *Id.*, pp. 439-440.

- **Raw Meat:** But most importantly, fire led to cooked food. Cooking food makes it softer and of course, safer, as it kills many harmful microbes that might have devastated early population groups. Softer food is easier to chew and to digest, and this in turn, meant that the muscles that control the jaw, which are attached to the top of the skull, decreased in size. This decrease in the size of the chewing muscles may have resulted in a larger cranial space. This change was so pervasive over a period of half a million years – how many people do you know who have an appetite for unprocessed raw meat?

- ✓ “By the Middle Pleistocene times in Java, *H. erectus* had changed, but not a great deal. A slight increase occurred in the height of the vault and the diastema and projecting canine had disappeared. The small brain continues in the Trinil (Sangiran) 2, 3, 10, 12, and 17 specimens, which are all remarkably similar. There seems to have been little evolutionary change in the Middle Pleistocene until the upper levels of the Kubah Beds are reached. Here, a recent significant find, Sangiran 17, estimated at about 500,000 years, represents a decided break in the similarity of Javanese Middle Pleistocene erectus forms.

Although this almost complete skull retains the basic morphological pattern of Java erectus, it is longer, broader and higher. The dental arch is remarkably similar to *H. sapiens*, and the forehead is higher than any other Javanese *H. erectus* of the Middle Pleistocene. These modifications of skull size are reflected in the cranial capacity of Sangiran 17, which measures 1,023 cm<sup>3</sup>. We do not presently know what processes might have occurred in the short time representing 30 feet of strata separating Sangiran 12 (900 cm<sup>3</sup>) from Sangiran 17 (1,029 cm<sup>3</sup>) that could have produced this increase in cranial capacity.” *Id.*, p. 383.

No, humans are not able generally to consume raw meats – our digestive system and psychology have changed so much from the evolutionary impact of controlled fire, that conscious effort is required to eat *unprocessed* raw meats (you would not dine with the lions and wolves) – and many humans don’t seem to prefer to consume even raw vegetables or to a lesser degree, raw fruits (though of course, we can and do). Warm food is reassuring and relaxing, it is a vital part of our psychology, the need to eat warm, cooked food, once a day.

- ✓ Not even Paleo-diet promoters hawk eating raw meat (but hawks do!).

- **Testosterone Bubble:** At a much later point in human evolution, approximately 150,000 to 50,000 years ago, there was a marked decrease in the testosterone levels of male populations over a wide range of ethnicities. This may have – is theorized to have – resulted in less violence, more cooperative behavior, and less distraction. The timing of the decrease coincides with most of the intellectual and cultural advances associated with late prehistoric humans.

- ✓ “Humans went through a major development 50,000 years ago, when the species, which first developed 150,000 years earlier, started to develop tools and art started to flourish. Testosterone levels in humans was beginning to moderate down to modern concentrations around the same time, according to a new study.

Study was undertaken of 1,400 modern and ancient skulls, which led to the understanding of decreasing testosterone levels. Among these were 13 skulls more than 80,000 years old, along with 41 specimens aged between 10,000 and 38,000 years, and 1,367 modern skulls, representing 30 ethnic backgrounds. Researchers believe

that lower levels of the male hormone may have led to a greater degree of understanding between people, reducing violence, allowing arts and toolmaking to become more advanced.

‘The modern human behaviors of technological innovation, making art and rapid cultural exchange probably came at the same time that we developed a more cooperative temperament,’ Robert Cieri, from the University of Utah and lead author of the study, said.

Decreasing testosterone levels were noticeable through the changes to the shape of human skulls from the period. Thick eyebrow ridges receded, as heads became rounder.” – James Maynard, “New Study Links Lower Testosterone Levels to the March of Civilization,” Tech Times, August 12, 2015.

- ✓ “Testosterone levels can also affect social interactions of our primate relatives, according to researchers. Male chimpanzees experience a large increase in testosterone levels during puberty, while concentrations among bonobos is small. When chimps become stressed, their bodies release additional testosterone, while cortisol, a hormone related to stress, floods the bloodstream of bonobos. Social interactions between chimpanzees are much more prone to violence than similar incidents between bonobos. Brow ridges are also much more pronounced in chimps than they are in the mellower species.” *Id.*

We have now reached a point where some men need testosterone-boosting treatments.

---

*“Biology is more like history than it is like physics. You have to know the past to understand the present. There is no predictive theory of biology, nor is there for history. The reason is the same: Both subjects are still too complicated for us.” – Carl Sagan, Cosmos, Episode 2*

---

**Backdoor Evolution:** Carl Sagan shows that empiricism *does not equate* to predictive ability.

There was no anthropology class in my STEM-oriented high school (we had a planetarium and a two story greenhouse inside the school), and no courses in psychology or any of the social sciences. On the latter, “World Cultures” was about as far as they got when they should have been teaching intro criminology. In the United States, at least, anthropology (of any kind) has been considered a college subject as no local school board would risk the wrath of the righteous right in funding a course in anthropology (or anything approaching evolution, even zoology).

This represents a major gap in our public education that probably has not changed, with consequences for civilization. In fact, evolution was not even discussed; rather, the teaching of evolution was back-doored in – as it was in so many places – through the teaching of biology by progression through the phyla of the animal kingdom. Many authors have pointed that modern biology or life sciences cannot be taught *sans* evolution. Further, to ‘disprove’ the ‘theory’ of evolution would require the destruction of the whole of modern science, as every branch of science has contributed over the last 150 or more years, to the developments in our understanding of life and evolution on Earth.

But what truly becomes interesting is when the controversial textbook Of Pandas and People (1989, 1993) is introduced into the conversation. In *Kitzmiller v. Dover Area School District*, 400 F. Supp. 2d 707 (M.D. Pa. 2005), the Court determined that the book was simply a reedited

creation science book where some terms were substituted for ‘creator’ to avoid claims that the book was creationist. Thus, the court deduced that the intent behind *Of Pandas and People* and the introduction as a required textbook in the Dover Area School District was an attempt to backdoor the teaching of ‘creation science’ in public schools, which had previously been rejected in *McLean v. Arkansas Board of Education*, 529 F. Supp. 1255 (E.D. Ark. 1982) and *Edwards v. Aguillard*, 482 U.S. 578 (1987). The *Kitzmiller* Court concluded thus:

- ✓ “Those who disagree with our holding will likely mark it as the product of an activist judge. If so, they will have erred as this is manifestly not an activist Court. Rather, this case came to us as the result of the activism of an ill-informed faction on a school board, aided by a national public interest law firm eager to find a constitutional test case on ID [intelligent design], who in combination drove the Board to adopt an imprudent and ultimately unconstitutional policy. The breathtaking inanity of the Board’s decision is evident when considered against the factual backdrop which has now been fully revealed through this trial. The students, parents, and teachers of the Dover Area School District deserved better than to be dragged into this legal maelstrom, with its resulting utter waste of monetary and personal resources.”

But there have been no court cases of which I am aware – after *Tennessee vs. Scopes* – regarding the backdoor teaching of evolution via high school biology (or sometimes called life sciences) classes. Defendant *Scopes* lost technically, but the real loser was Fundamentalism, and the real winners were the Modernist. In matters of pure fact, as in cases before the Court where establishing *fact* is paramount, science clearly has the upper hand over religion, which is why it is utter fallacy for religion and creationist to fight in Court battles, especially ones with no jury.

There is an interesting dynamic playing out, corollary to the Empirical Mythology discussion in 1 Technology, p. 691, *supra*: Science has been very careful not to cross over into the reserve regions of religion – except that it hasn’t stopped science-fiction writers from regularly going there – but religion has ham-handedly attempted to invade the factual regions of science on many occasions. It is worth reading again:

- ✓ “Science and religion ask different questions about different things. *Where religion addresses ontology, science is concerned with ontic description.* Indeed, it is what Orthodox theologian David Bentley Hart calls their ‘austere abdication of metaphysical pretensions’ that enables the sciences to do their work.” – Michael Robbins, “Atheists Used to Take the Idea of God Seriously. That’s Why They Mattered.” *Slate Magazine*, July 8, 2014 (emphasis added).

---

*“People never stop to think about these basic facts when they watch wars and cop shows on the television. People take too much for granted. Each time a gun is fired the whole history of engineering comes into play. Of politics, too: war, assassination, revolution, terror. Guns aren’t just history’s props and agents: they’re history itself, spinning alternate futures in their chamber, hurling the present from their barrel, casting aside the empty shells of the past.”*

– Tom McCarthy, *Remainder* (2005)

Endnotes.

<sup>1</sup> Citation: Cognitive Psychology and Cognitive Neuroscience – Problem Solving from an Evolutionary Perspective, by AkumAPRIME, Anwinkle, Aschoeke, et al. (14 contributors, 52 anonymous edits), at <https://en.wikibooks.org/w/index.php?oldid=2064115>, published in PDF book form at <http://www.saylor.org/site/wp-content/uploads/2011/05/Problem-solving-from-an-evolutionary-perspective.pdf> (Saylor Academy).

<sup>2</sup> Citation: “Imitation is the sincerest form of flattery that mediocrity can pay to greatness.” – Oscar Wilde.

<sup>3</sup> Commentary: I read Belenko’s co-authored (with John Barron) autobiography, *MiG Pilot* (1980) sometime around 1985. Some Marine who barrowed the book in the late 1980s drew a moustache and goatee with a pen on Belenko’s cover image. Because that’s what they did to books in high school, and most first-enlistment military service members are high school kids with guns.

<sup>4</sup> Commentary: “Conjunction junction what’s your function?” – Schoolhouse Rock, “Conjunction Junction” (1973).

- ✓ I am a bit raffish. That much should be clear by now. What the heck does Schoolhouse Rock have to do with reverse engineering alien technologies? But if you think about it long enough ...

<sup>5</sup> Commentary: There are lots of conjecture and conspiracy theories on this point in the UFO community. Does the government have a UFO, bodies, or other alien artifacts stowed somewhere down Extraterrestrial Highway (Nevada SR 375)? Have they made any progress in figuring out the technology? Remember pushing the lever forward is reverse. Hollywood loves UFO conspiracy theories (e.g., Independence Day, Close Encounters).

<sup>6</sup> Citation: I highly recommend viewing the April 18, 2020, Up and Atom YouTube video “Why We Might Use Different Numbers in the Future,” which clearly explains what always seems like a complicated subject of numbering systems. The video references books by Isaac Asimov on the advantages of different base numbering systems.

<sup>7</sup> Commentary: Native American tales still have some charm, whereas Ancient Greek tales have always seemed to have been told by a bunch of drunk old men.

- ✓ Though I could not find it, I remember a native tale about a coyote who carried a burning twig in its mouth down from a volcano to give man fire.

<sup>8</sup> Citation: “The first known use of matches was in 577 during the siege of a town in northern China. Women in the town used sticks coated with a mixture of chemicals to start fires for cooking and heating, thus allowing them to conserve their limited fuel by putting the fires out between uses. The details of this technique were subsequently lost to history. It was not until 1826 that John Walker of England invented the first friction matches. Walker’s matches were ignited by drawing the heads through a folded piece of paper coated with ground glass. He began selling them in 1827, but they were difficult to light and were not a success.” – Chris Cavette, “Match,” How Things are Made (<http://www.madehow.com/Volume-3/Match.html>), undated article.

<sup>9</sup> Commentary: In the universe of the Andromeda television series, the Vedrans invented slipstream drive and conquered the worlds of their galaxy, forming an empire, using their exclusive control of the means of FTL travel. The Kalderan race was attacked by the Vedran Empire, but they later captured a Vedran starship and reverse engineered the slipstream drive. With slipstream drive, the Kalderans built a fleet of starships that were able to strike back against the Vedrans and only eventually succumbed due to the vast size and resources of the Vedran Empire compared to the much smaller area controlled by the Kalderan Commune (see discussion of Minor Races, 4 Diplomacy *infra*). Eventually the Vedrans, like the Romans, understood that they could not control such a large empire (three galaxies) indefinitely, and the Vedran Empire morphed into the more democratic Systems Commonwealth. Knowledge of the slipstream drive thereafter spread to all technological species, either through membership in the Commonwealth, or because the Kalderans gave the technology to everyone to encourage galactic revolts.

<sup>10</sup> Commentary & Citation: For example, the Russians gained the knowledge and ability to produce tungsten steel when they took over the Krupp Works in Magdeburg during the post-WWII occupation (source, Wikipedia article, “Krupp,” July 20, 2018). Tungsten steel, which Germany had been manufacturing since before WWI, was the material key to the superiority of German armor and weapons. *This implies that the Russians did not have tungsten steel armor during WWII.* This is an example of how a technology could be captured with a colony, at the judgment of the Concierge; no reverse engineering was required.

- ✓ England had only one tungsten mine in 1912, and it was owned by the Germans and England was getting 90% of its tungsten from German companies before WWI (Greig Watson, “World War One: Tungsten ‘the armour plate of conflict’” BBC News, June 6, 2014). During WWII, the allies bombed tungsten mines controlled by Germany along with other mines that provided nickel and molybdenum to harden steel, by 1943, the quality of new German armaments declined due to shortages – tungsten was also used in armor-piercing tank shells which drained the supply (the Soviets also used tungsten rounds, e.g., the T-34 fired them).

IN RE: EMMETT L. BROWN

---

Decided April 1, 1991

---

Before RICH and MARKEY, and THYME, District Judge.<sup>1</sup>

This appeal is from the decision of the United States Trademark and Patent Office Board of Patent Appeals and Interferences (the Board), affirming the Examiner’s final rejection of all of the claims of Emmett L. Brown’s patent application Serial No. 840,336 filed March 18, 1986, entitled, “Time Machine.” We affirm.

**Background**

On March 18, 1986, Brown filed a patent application for an invention entitled, “Time Machine.” The application described an admittedly novel apparatus which had formerly been the exclusive province of science fiction novels. According to the invention, under proper operating conditions, a device called a “flux capacitor” could displace the apparatus a specific amount either forward or backwards in time. Temporal displacement would occur upon the application of approximately 1.21 GW of power while the apparatus (in the preferred embodiment, a late model sports car) was travelling at a speed of 88 m.p.h.<sup>2</sup>

\*\*\*

Brown briefly asserts that all of the pre-1985 uses were subject to the “experimental use” doctrine. This doctrine was first established by the classic case of City of Elizabeth v American Nicholson Pavement

---

<sup>1</sup> Judge Justin Thyme, United States District Court for the Western District of California, sitting by designation.

<sup>2</sup> While other technical details of the device are truly fascinating, a discussion of them is not necessary for this opinion.

Company, 97 U.S. (7 Otto) 126, 24 L.Ed. 1000 (1878), and has been followed by numerous cases thereafter. See, e.g., Baker Oil Tools, 828 F.2d at 1564, 4 USPQ2d at 1214; Hycor Corporation v Schlueter Co., 740 F.2d 1529, 1535, 222 USPQ 553, 557 (Fed. Cir. 1984); TP Laboratories, 724 F.2d at 971-72, 220 USPQ at 581-82. The Board properly rejected this argument, given (1) the time machine was clearly adequately tested no later than Brown's original return to 1985 from the year 2015, so subsequent use was not "experimental," and (2) the lack of control by Brown over his invention, noted above, defeats any assertion of experimental use. In Re Hamilton, 882 F.2d 1576, 1580, 11 USPQ2d 1890, 1894 (Fed. Cir. 1989).

Brown next makes a number of ingenious arguments resulting from the unique facts of this case. First, he argues that the "one year" filing requirement of §102(b), should be measured from the time of the first reduction to practice (here 1985) rather than uses which occurred in the space-time continuum before then only due to the fact that the invention in question was a time machine. Brown argues that he truly first "used" the machine in October 1985, and filed his patent application within one year thereafter, in March 1986. Brown argues that he could not have filed his application any earlier than 1985, because, although the machine admittedly was "used" numerous times in 1885 and 1955, it had not actually been "invented" until 1985 (at least according to Brown's subjective point of view).

This is the stuff from which science fiction novels are made. The problem is that §102(b), as written, does not recognize glitches in the space-time continuum such as Brown has created. It merely talks about uses more than one year before the patent application. We note that the statute easily could have been written to take Brown's predicament into account, since the concept of time travel was well known by the time of the enactment of the Patent Act in 1952. See H. G. Wells, The Time Machine (1895); R. Heinlein, By His Bootstraps (1941), reprinted in The Menace from Earth (1959) (using a time machine, a man meets himself three times, argues with himself, and even loses some of those arguments).

Brown essentially argues that the Board’s holding is unfair. He argues that any time machine invention would be subject to the problem he has now encountered. That is, as soon as a patent issued, an infringer would use it to build a time machine, travel back in time, and invalidate an otherwise valid patent by “using” the time machine more than one year before the patent application’s filing date. Brown argues that it is inherent that any time machine would be “used” more than one year before it’ patent application was filed, by the very nature of the invention.

Brown thus poses the interesting hypothetical question of whether a post-issuance infringement of his patent by another could provide a defense to a patent infringement claim. This interesting hypothetical has no bearing on this case. Here, Brown himself used, or allowed the use, of his invention more than one year before he filed his patent application. He cannot now complain.

Finally, Brown asks us the following hypothetical question. Suppose he now used his invention to travel back to 1885, and refiled his patent application at that time. Clearly there would be no prior public use problem under §102(b) (or under its predecessor statutes). Such an application would have been filed well before any use of the time machine by anyone.

Although we are not in the business of answering hypothetical questions, in this situation we may respond as follows. Under Brown’s duty of disclosure of material facts to the Patent Office, Brown would be obligated to disclose this opinion to the Patent Office as part of his filing of any such 1885 application. In that case, it appears to us that this opinion would bar any such 1885 application under the doctrine of res judicata – even though under those circumstances, this opinion would not have been written until 100 years in the future.

**Conclusion**

The Board’s decision rejecting all of the claims is

**AFFIRMED**

*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*  
*See Appendix TECH – Technology Progress*

*“Certainly an inventor ought to be allowed a right to the benefit of his invention for some certain time. Nobody wishes more than I do that ingenuity should receive liberal encouragement. In the arts, and especially in the mechanical arts, many ingenious improvements are made in consequence of the patent right giving exclusive use of them for fourteen years.”*

– Thomas Jefferson <sup>1</sup>

**Technosolution:** Technosolution is the dogmatic unspoken belief (and ideology of modernity) of nascent industrialized technological societies that all problems, including social problems, will eventually be solved by *technology* (e.g., Bob Moser quote, bottom or Twilight Zone episode, “Number Twelve Looks Just Like You,” 1964).<sup>2</sup> Technosolution is a special modern subset of Forward Expectations, see 1 Disruption, p. 255, *supra*. It is the core of scientific utopian dreams.

Technosolution seems to be related to scientism (like a non-identical twin), which term itself is an implied critique of exaggerated expectation of *science* in the realm of human affairs; Case, Diamond, Elwell, and others featured previously argue against scientism in their own ways:

- ✓ Merriam-Webster online dictionary at *scientism*: **2**: an exaggerated trust in the efficacy of the methods of natural science applied to all areas of investigation (as in philosophy, the social sciences, and the humanities). First use was in 1870.
- ✓ “Scientism is the promotion of science as the best or only objective means by which society should determine normative and epistemological values. The term scientism is generally used critically, implying a cosmetic application of science in unwarranted situations considered not amenable to application of the scientific method or similar scientific standards. ... In the philosophy of science, the term scientism frequently implies a critique of the more extreme expressions of logical positivism...” – from Wikipedia article, “Scientism,” captured April 23, 2020.
- ✓ “The roots of scientism extend as far back as early 17<sup>th</sup> century Europe, an era that came to be known as the Scientific Revolution. Up to that point, most scholars had been highly deferent to intellectual tradition, largely a combination of Judeo-Christian scripture and ancient Greek philosophy. But a torrent of new learning during the late Renaissance began to challenge the authority of the ancients, and long-established intellectual foundations began to crack. The Englishman Francis Bacon, the Frenchman Rene Descartes, and the Italian Galileo Galilei spearheaded an international movement proclaiming a new foundation for learning, one that involved careful scrutiny of nature instead of analysis of ancient texts.” – Thomas Burnette, “What is Scientism,” American Association for the Advancement of Science (AAAS), undated.
- **History Patented:** During the development of modern Europe, every sovereign struggled with the instinctive need and urges to control a phenomenon they barely understood. There were a lot of moving parts to this problem – and states both feared and needed the powder keg potential of the new European obsession with tinkering on which they sat. The Republic of Venice is held to have issued the first statutory patent system in 1450, the basic principles of which still exist today in all patent systems. The English monarch (and probably others) issued patent decrees which amounted to Crown monopolies until 1624 when all monopolies were revoked by the Statute of Monopolies.

The first U.S. Patent Law was passed in 1790, (Colonial Legislatures issued individual patents before the Revolution) and the first French Patent law was established in 1791. Throughout the 18<sup>th</sup> Century, patent law was refined to require public specification in patents, to allow patents for improvement to existing machines and processes, and in the 19<sup>th</sup> Century, the addition of patent examination. Finally, in the 18<sup>th</sup> Century, governments, who had previously been pushed and jostled along by technological developments, affirmatively embraced and encouraged technology advances, often and usually, for the advancement of their struggles with rival nations.

- ✓ George III of England (reigned 1760-1801), much maligned in the Thirteen Colonies, may have been one of the first monarchs to have a keen interest in and understanding of science and technology; he was mocked in the press for his interest in mundane matters, such as agriculture. The expectation of being titled and proudly useless was already established in Europe, see Arrears in Aristos discussion, top of 2 Entropy, p. 234, *supra*. He is also the first of the House of Hanover kings born and raised in England, who spoke native English. George I and II were born in Germany and had to learn English.
- ✓ Some fact information gleaned from Wikipedia article, “Patents,” March 16, 2018.
- ✓ See discussion of the Longitude Act of 1714 and Mr. Harrison’s invention, 2 Eras, EN 2, p. 776, *infra*. The Longitude Act prize seems to be a sea change in sociopolitical acceptance of technology, at least as to the Anglo-sphere.

---

*“In 1972, the federal government even blessed the emerging field of futurism with a new research agency, the congressional Office of Technology Assessment, which reviewed proposed legislation for its long-term effects. Futurists were optimistic about lawmakers’ new interest in the long term.... Newt Gingrich has long been enamored of science fiction – he wants to build a moon base. But when Mr. Gingrich, a Georgia Republican, became speaker of the House in 1995, he quickly shut down the Office of Technology Assessment. The government no longer had any place for futurists, and every decision about the future was viewed through the unforgiving lens of partisan politics....”*

*‘It is ridiculous that the United States is one of the only nations of our size and scope in the world that no longer has an office that is dedicated to rigorous, nonpartisan research about the future,’ Ms. [Amy] Webb [founder of Future Today Institute, Prof. NYU Stern School of Business] said. ‘The fact that we don’t do that is insane.’”*

– Farhad Manjoo, “Why We Need to Pick Up Alvin Toffler’s Torch,” New York Times, July 6, 2016

---

**So Comes the Future:** People ‘know’ you shouldn’t drive drunk, but they do anyway. They make it home and it’s all right, so they forget about it. Then one day, they don’t make it home driving drunk and everything is never going to be all right ever again. So comes the future.

- ✓ It’s *insane* to drive drunk, you are a danger to yourself and others, and that’s why they toss you in a cell. Maybe that’s why we are still on Earth, humanity is a danger to itself and others. We confine people to jail and mental hospitals (and euthanize sick animals) for that very reason.

**The Patent Process:** The Patent is the process by which players may create and introduce new milestone technologies into the game in relation to the position's technology grid (i.e. Matrix). A Patent is an Interpretation, and a successful Patent – which is not published – must be used as the Interpretation accompanying the Technology Power activation used to prosecute the successful Patent on the Regular Turn it is introduced. If the Patent is not successfully prosecuted, a News Event must be used as the Interpretation for the Technology Power on that turn (though what the News Event reports is up to the players). Both must be provided with the position's Regular Turn actions.

It costs a lot of RPs, Acts, and Power Activations to get to the new Patent prosecution. Players should carefully consider the proposed Patent so as to create a useful, game-changing technology. All the basic technologies of interstellar civilizations are already present in the Existential Patents. So go for something crazy; Patents should be non-trivial.

- ✓ For example, the baseline against which to compare the Existential Patents is nothingness; they create 'things' in the game by their existence and that is non-trivial to the game. One might naturally also compare them to our early 21<sup>st</sup> Century technology.

While it is hard to estimate during the game design, probably each position may successfully prosecute 6-10 *original* (i.e. non-Existential) Patents per game. Taken together then, all of the Patents of all of the positions in the game may advance interstellar technology significantly.

- ✓ There is a video on PBS Space Time channel titled, "Should we build a Dyson sphere?" We cannot. We wouldn't even be able to start. We don't have the resources or technology and possibly won't ever. So I don't understand the question?
- **The Patent Application:** To begin the Patent process, the proposed Patent must be submitted to the Concierge with the position's Actions, and the Technology Power must be activated on the same Regular Turn for the purpose of Patent Prosecution. The proposed Patent must contain all of the elements of the Patent, except the User Manual, at the time of the submission. Other than the Power Activation cost, there is no other cost to prosecute a Patent Application.
- **Patently Different:** Patents in GGDM, unlike real world patents, never expire during the game, and only their secrecy grants the holder exclusive rights – until they are reverse engineered or shared.
  - ✓ For example, Delenn offered to share Minbari anti-gravity technology with other races in the press conference in the Babylon 5 episode, "Rising Star" (1997), to entice them to join the Interstellar Alliance.

Also, Patents in GGDM are non-commercial, so many of the real world issues, such as submarining patents, patent thickets, patent ambushes, are avoided; there is no basis in GGDM for making a claim against another position due to 'patent infringement.' Thus, Patent as used in GGDM has only the loosest relationship with the concept as understood in the real world (see feature quotes, endnotes, and Violating the Laws of Man and Nature, 3 Temporal Technology, top of p. 828, *infra*, for discussion) and the game depends upon the Concierge to keep it all reasonable and consistent.

- ✓ The stark difference between real world patents and GGDM patents is this: a real world patent describes something that works or is projected to work (i.e. not in violation of any established scientific principles) and would do so regardless of whether or not it is patented; whereas, a GGDM Patent describes the operational qualities of

game objects and those game objects cannot exist without a successful GGDM Patent Prosecution. And the scientific principles? ... well, they are optional.

*“The books of the Ionian scientists are entirely lost. Their views were suppressed, ridiculed and forgotten by the Platonists and by the Christians who adopted much of the philosophy of Plato.” – Carl Sagan, Cosmos, Episode 7<sup>3</sup>*

**Existential Patents:** It is assumed that all positions in the game represent some technologically advanced society and that each position enters the game with the necessary technological background required to engage in interstellar colonization and culture. These existential technologies are represented by a special type of Patent, the Existential Patents, that are available for purchase using Inheritance Points during the game set up.

- ✓ See Patents for Sale, 7 Beginnings, p. 72, *supra*, for ‘purchase’ of Existential Patents through Applications during the setup process. The Existential Patents serve as a rules and setting nexus connecting Beginnings, Technology, Patents and Eras.
- ✓ Positions receive, in addition to the Existential Patent, one or two Applications to place on the Matrix from the Patent’s Theory. This represents a sort of ‘crossing the threshold’ to the 1<sup>st</sup> Era, most of the Existential Patent technology is pre-1<sup>st</sup> Era, with the addition of a couple of nifty inventions, discoveries, or innovations.

The Existential Patents are the only ‘pregame’ technologies allowed, players may only develop new technologies after the game starts. The game can run on the Existential Patents alone; the Patent process allows players to shape the technology of the game and/or improve Existential Patents. The Existential Patents are provided in Appendix EPAT.

- ✓ One of the most immediately notable differences between the original Star Trek *Enterprise* and Star Trek: The Next Generation *Enterprise* – I recall this as my first impression on seeing ST TNG – was the feel and look of the ship design, especially the bridge. The Next Generation series felt relaxed, comfortable (sometimes too slick and particle-of-the-week comfortable), accepting of technology, whereas the original Star Trek was always gadgety, Spartan, and, like the audience, not quite comfortable with technology. As soon as I began watching The Next Generation, the original Star Trek that I had grown up loyally watching on PBS instantly seemed clunky and old.
- **Patent on Posterity:** It is impossible for any position to ‘purchase’ all of the Existential Patents with their Inheritance Points (IPs, not to be confused with, Resource Points/RPs). Any Existential Patent not obtained during set up **may not** be later ‘purchased’ by any means, but must be submitted, and processed as a regular Patent by any position once that position has the correct alignment of Applications on the 1<sup>st</sup> Era Matrix required by the Patent.
  - ✓ As will be explained later in 1 Eras, all Existential Patents must be completed to advance to the 2<sup>nd</sup> Era of technology. A position should start with as many Existential Patents as possible and is initially restricted from prosecuting new Patents.
  - ✓ See Temples of Science, 1 Technologies, p. 690, *supra*, and The Matrix, 1 Eras, p. 756, *infra*, regarding the Era Matrix.
- **Needful Things:** There is somewhat of an order of precedence among the Existential Patents, for example, it would not do a position any good to have the Scout Ship or 1<sup>st</sup> Era Warship

Existential Patent, before having the Generic Stardrive Existential Patent and Ship Systems Existential Patent. A position could begin *slow* with Generic Stardrive Existential Patent and Scout Ship Existential Patent, without having the Ship Systems Existential Patent.

- ✓ See 2 Stardrive and 3 Movement generally, *infra*, for the Existential Patents mentioned in this section.

*“The toe bone’s connected to the foot bone,  
The foot bone’s connected to the ankle bone,  
The ankle bone’s connected to the leg bone,  
Now shake dem skeleton bones!  
The leg bone’s connected to the knee bone,  
The knee bone’s connected to the thigh bone,  
The thigh bone’s connected to the hip bone,  
Now shake dem skeleton bones!”*

– James Weldon Johnson & J. Rosamond Johnson, “Dem Bones” (1928)

**The Parts of a Patent:** A Patent form consists of five parts (see Appendix EPAT1 for samples of Patent formats), as follows:

- **Theory:** The Patent must specify the Matrix location and research type of at least two Applications currently on the position’s current Era Matrix. The number of Applications specified will depend on various factors, such as the Operational Qualities of the Patent, the Applications available, and other possible factors.
  - ✓ All Applications specified on the Patent must be adjacent on the Matrix and must be in the precise order specified on the proposed Patent. This is more bothersome with Existential Patents, players have more freedom with their own Patents.
  - ✓ Any two Applications on the proposed Patent may be **confirmed or unconfirmed** (see below); confirmed Applications make it more likely the Patent will be successful, but there are other balancing factors that weigh in favor of trying unconfirmed Applications.
  - ✓ *A single Application may be used for any number of Patents, if its Matrix position allows* but cannot be used twice in the same Patent. Clever players will form Patents looking at lines of Applications already existing on the Matrix.
    - See 3 Patents, p. 747, *infra*, for ‘connecting the dots’ to make a Patent.
- **Operational Quality:** There are four possible Operational Qualities for any technology: Physical Item Technologies (PITs), Enhancement Technologies (ETs), Continuous Operational Technologies (COTs), and Technological Devices (TDs). Each Patent must specify only one Operational Quality. The type of technology chosen for the Patent is the major controlling factor for the number of Applications, the Effects, and Cost of the Patent.
  - ✓ Operational Qualities will be discussed in greater detail in the next part, 2 Patents. All that is important at this point in the rules is that it is a required part of the Patent and affects other parts of the Patent.

- Effects: The Patent must specify a number of Effects of the technology equal to the number of Applications *minus one*. Each Effect of the technology is a short, straightforward description, without qualifications or reservations (simple sentences), of the operational capabilities – of what the new technology is ‘supposed to do.’ For each Effect, the Patent must specify one Application type from Applications section, followed by the statement, and the Effect statement must be reasonably related to the Application type. Together, the short, simple statements of Effects, must form a group picture of the technology that is reasonably complete and can be readily understood by the Concierge. See Appendix EPAT1 for examples.
- eXistenZ: Any Patent which gives the ability to construct a new thing in the game (and by extension, introduces a new physical thing to the game), must begin with a statement creating the existence of the thing and the Power Activation required to build it. Additionally, any activity relating to the new thing must contain a statement as to the Power Activation required for that activity to occur. Not all Patents create new things in the game.
  - ✓ A tribute to the 1999 movie eXistenZ, which aired on Sci-Fi Channel, that was written and directed by the same person who wrote and directed the 1983 surreal movie Videodrome that I watched in the theatre when I was 15 years old. It is somewhat shocking now that I was able to buy the movie ticket by myself, I think the movie was definitely rated R; there was no accompanying adult supervision.
- Costs: The costs are the balancing factors of the technology. There are two types of costs. All costs sections must contain a cost per unit or a cost of implementing the technology, expressed in RPs, which is based on the chosen Operational Qualities. In short, if the Patent were for a new type of ship, it would require that the cost of building each ship of that type be part of the Cost section of the Patent.
  - ✓ The second type of ‘Cost’ is one limiting (negative, converse, offsetting) statement, corresponding to each of the Effect statements. The Cost statements must be in the same general form (straightforward, simple statements) as the Effect statements and correspond one for one to the Effects. See Appendix EPAT1 for examples.
- User Manual: The User Manual consists of the operational notes and rulings of the Concierge to flesh out the technology as the game progresses. Players may submit in the User Manual suggestions as to how the technology will operate in the game, but the Concierge is not bound by any such suggestions. Further, the Concierge will not make or offer any advanced rulings on how the technology will operate in any given situation; notes will only be added to the User Manual as necessary, as situations arise that require an interpretive ruling.
- Patent Truths: All of the statements of the Effects, Costs, and User Manual sections are assumed to be absolutely true unless they are designated as absolutely false. Statements on the Patent may each only be either absolutely true or absolutely false. Patents are official Interpretations and like other Interpretations, create the reality of the GGDM in-game universe.

Patents are thus descriptive or factual interpretations *in an odd sort of way*:

- ✓ “An interpretation is a *descriptive interpretation* (also called a *factual interpretation*) if at least one of the undefined symbols of its formal system becomes, in the interpretation, the name of a physical object, or observable property. A descriptive interpretation is a type of interpretation used in science and logic to talk about empirical entities.” – from Wikipedia article, “Interpretation (philosophy),” November 30, 2015.

*“We regret nothing we have said or done on this show – not the epic tech fail of our first KFUEO broadcast, our poking fun at the phony charges of ‘sacerdotalism’ or ‘liberalism,’ our episodes on evolution, or our mocking the false pretensions of church institutions and power structures. Religion needs a good, swift kick in the shins, and we were more than happy to deliver it, even if we did occasionally get bruised in the process.”*

– Rev. Craig Donofrio and Rev. Bill Cwirla (“The Manly Doctors of Divinity”), from [godwhisperers.org](http://godwhisperers.org)<sup>4</sup>

**God Whisperers:** Though I had not heard of this show before writing this section, it seems that it might have been interesting to listen to once or twice, even if frequently disagreeable to my own thoughts.

GGDM creates things in the game conscience by ‘speaking’ and the participants are that voice. The creation of things in the mind by speaking is not an alien concept to Western Civilization. The Bible, with which most members of Western Civilization are at least familiar in passing, begins thus (e.g., Genesis, Chapter 1, New International Version, available online for free) – the image of creation is created in the mind of the reader or listener by the words, in mortal imitation of the actual creation of the universe. The power of the spoken word to ‘create’ images, knowledge, concepts, and feelings has long been known; it is the core of rhetorical theory, storytelling, and lyrical music, and was argued in Plato’s *Gorgias*, around 400 B.C. Without it, the world would be a very literal place, like the opening scene of Charles Dickens’ *Hard Times* (1854), where Mr. Bounderby asks students to describe a horse (see Gradgrind discussion, 1 Colleges, p. 463 and feature quote bottom p. 462, *supra*). In *Dune* (1965), Frank Herbert continues, “Thoughts have sound, sound has form...”

- ✓ “In the beginning was the voice. Voice is sounding breath, the audible sign of life.” – Otto Jespersen, *Language, Its Nature, Development and Origin* (1922).
  - Is God simply a voice then, or did voice precede God? Heinlein please?
- ✓ “For the one point in which we have our very greatest advantage over the brute creation is that we hold converse one with another, and can reproduce our thought in word. Who therefore would not rightly admire this faculty, and deem it his duty to exert himself to the utmost in this field, that by so doing he may surpass men themselves in that particular respect, wherein chiefly men are superior to animals?” [Cicero reporting the words of Lucius Crassus as repeated to him by Gaius Cotta, meaning it might just as well be fiction, probably is, but the point is still worthy and well-made] – Marcus Tullius Cicero, *Of Oratory* (55 B.C.), Bk. 1 (trans. E. W. Sutton and H. Rackham) from Patricia Bizzell and Bruce Herzberg, *The Rhetorical Tradition* (1990), p. 204.
- **Word of Man:** The causes, sources, and reasons behind societal problems is a huge complex subject. But consider for a moment, in the context of GGDM’s underlying themes, that a contributing factor of many societal problems are interpretations. How can technology ‘fix’ interpretations (both group and individual) that might be behind some societal problems? Any technological solution to societal problems imagined are usually radical and repulsive. If we had the technology, should we put chips in people’s heads to control and monitor their

thoughts (*à la* Ender’s Game (1985))? How about political subliminal messaging in video and television programs (*à la* Videodrome (1983))? How about Johnny Mnemonic?

*“(The) CEO of ... a counter-extremist data firm that’s working with Google, expressed wild optimism last fall in a(n) ... op-ed. ‘By marrying big data with personal empathy,’ he wrote, ‘our generation can starve extremist organizations of their ability to recruit, and they will wither on the vine and die.’ That’s Silicon Valley speak for ‘technology can fix everything’ – including societal problems that platforms like YouTube have made demonstrably worse.”*

– Bob Moser, “How YouTube Became the World Wide Leader in White Supremacy,” *New Republic*, August 21, 2017

## Endnotes.

<sup>1</sup> **Commentary:** Patents are not in any way, a governmental control on technology; they instead encourage technological innovation by granting protections, and serve as a public record of innovation for later. This is not the same as arguing that patents ‘control’ technology by discouraging inventors or researchers from inventing new things that might infringe on an existing patent.

<sup>2</sup> **Commentary:** I don’t know where I picked up the term and concept of “technosolution.” I know that I read it somewhere in the early 90s; I did not stumble on this concept myself, this is not one of my GGDM neologisms. The base concept is however, unmistakably a criticism of how modern Western society solves social problems, utopian expectations. It is also related generally to the current German term, *wunderwaffe*, popularized during WWII.

<sup>3</sup> **Commentary & Citation:** “Boffin” is a British comic slang word for scientist, technician or engineer that I detest and I also tend to acutely dislike boffin characters *in any form of fiction*; e.g., the eye-rolling comic depiction of the two scientists in *Pacific Rim* (2013) – a parody of the essential role of British scientists in the World War effort of our grandparents – I they felt detracted from the movie. I first encountered the word in a British article title about astrophysics or cosmology a few years ago. Boffin is an example of a term that is driven by media and culture, and I am not a fan of television sitcoms (or even sitcom movies) generally, or of shows that appear to make lowbrow fun of intelligent, educated people such as the sitcom, *The Big Bang Theory* (2007). I guess that makes me an elitist and I don’t care, our civilization has enough low-brow and dumbing-down to fill the dark matter balancing requirement of a galaxy. The term originated as sailor’s comical slang, was elevated to somewhat heroic-status during World War II, but absent existential threat and positive media-shaping usage has slowly reverted to the comical. I certainly didn’t feel that its use in the article title was complementary of what the scientists in the article were reportedly doing – which raises, I guess, another issue more properly suited for journalism class: to what extent should print article titles be uncomplimentary, disparaging, disrespectful of the subject of the article?

- ✓ I searched a folder where I saved about 9,000 articles over the years. I did not find the article that included “boffins” in the title, but was surprised to find six articles where the word was used, including ‘astroboffins’ and ‘boffinry’ variations. All six articles, published between 2012 and 2015, were from *The Register*, a somewhat controversial, flamboyant, and disrespectful (they certainly push the tabloid-like envelope) “English technology news and opinion website” (Wikipedia article, “The Register,” May 3, 2019). It is odd cant that a website that makes its business and reputation reporting the progress of science, the products of technology, and from whose work and technology they exist (a situation akin to religion apologist bloggers criticizing, arguing against, damning, and dismissing science on their webpages), should regularly use a word so disrespectful to the scientists, technicians and engineers producing what they report? It is notable that *The Register*’s logo includes the phrase, “Biting the hand that feeds IT.” *The Register*, I suspect, won’t care what I think anyway (reference to their response to Martin Robbins’ criticism (with whom I agree regarding their repeated use of ‘boffin.’..), as partially reproduced in Wikipedia article. *Id.*).

<sup>4</sup> **Commentary:** I include their epithet “The Manly Doctors of Divinity” for amusement at the stick-in-the eye implications to the rest of their profession, not for their promotion or for the truth of the matter; it is amusing that some of their colleagues must have been irked by it. The ‘men of the cloth’ have stumbled over their own robes lately.

*“[The question whether there is a patentable invention] is as fugitive, impalpable, wayward, and vague a phantom as exists in the whole paraphernalia of legal concepts. It involves, or it should involve, as complete a reconstruction of the art that preceded it as is possible. The test of invention is the originality of the discovery, and discovery depends upon the mental act of conceiving the new combination, for substantially every invention is only a combination. Nothing is more illusory, as nothing is more common, than to assume that this can be measured objectively by the magnitude of the physical readjustments required.*

*Courts never tire, or at least in earlier times they never did, of expatiating upon the freshness of insight which observes a little, but fruitful, change which had theretofore escaped detection by those engaged in the field. When all is said, we are called upon imaginatively to project this act of discovery against a hypostatized average practitioner, acquainted with all that has been published and all that has been publicly sold. If there be an issue more troublesome, or more apt for litigation than this, we are not aware of it. (...)”*

– US Judge Learned Hand in *Harries v. Air King Prod. Co.*, 183 F.2d 158, 162 (2d Cir. 1950)

**Pet Rock:** In the real world, if you invent a successful product, no matter how trivial, someone will come out and say they invented it first and that you stole it from them, threaten lawsuits, even though they never wrote it down, published it, you never heard of them, and there is no way to make a connection between your invention and their idea – inventions and ideas can occur independently (e.g., bread, writing, bow and arrow) in different places and times.<sup>1</sup>

- ✓ “Dahl continued to work in advertising; however, he avoided interviews for years, because ‘a bunch of wackos’ harassed him with lawsuits and threats. Dahl said in 1988: ‘Sometimes I look back and wonder if my life would have been simpler if I hadn’t done it.’” – from Wikipedia article, “Pet Rock,” citing to The Milwaukee Journal, “Between a Pet Rock and a hard place,” (no author credited), November 15, 1988 (available free on [news.google.com/newspapers](https://news.google.com/newspapers)).<sup>2</sup>

I remember the Pet Rock fad from when I was young, I didn’t get it, thought it was dumb even in elementary school. Some kid in my class brought one to school, with the box and everything.

- ✓ “Although Dahl was referred to as the inventor of the Pet Rock in obituaries that followed his 2015 death at 78, he never filed for a patent or trademark. Maybe he didn’t get around to it – or maybe he figured that by the time his patent was approved, his fad creation would have run its course. That assumption would have proven correct, of course. The Pet Rock buzz lasted all of a year, if that, by which time Dahl estimated he had sold 1.5 million units. That was enough time to make him a rich man, driving a Mercedes and buying a swimming pool. Marguerite Dahl said he designed and built the Carry Nations Saloon in Los Gatos.” – Reid Creager, “Timing, Marketing Made the Pet Rock Roll,” *Inventor’s Digest*, July 1, 2017.
- ✓ “There is no way to patent a rock as a rock. As of a few years ago, U.S. patent law allows genetically modified organisms to be protected, although the Pet Rock wasn’t really one of those.

If the Pet Rock were a new invention, it would have required a utility patent. Utility patents must meet three criteria to be approved: novelty, non-obviousness and utility (usefulness). In other words, it has to be a new idea, one that would not strike an expert in the field as obvious, and it must have some use. Although it may sound ridiculous, when it was introduced the Pet Rock met these criteria: It was a new idea, it was hardly obvious to geologists or toymakers, and it had utility, i.e., it made people laugh.

With a really good patent lawyer, Dahl might have been able to get a utility patent to protect the Pet Rock as a new invention. The easier route would have been to trademark a design, etch it onto the rock, and to acquire a design patent on rocks etched with that trademark or logo.” – ‘lily kang 96,’ “The Pet Rock: A Story of Invention and Creativity,” Patent Club (blog), March 15, 2014.<sup>3</sup>

---

*“Patent prosecution before the Office should not be viewed as adversarial. Instead it should be understood to be a cooperative investigation between the Examiner and the Applicant, which ensures an Applicant receives a patent only for that which they are entitled to in accordance with the Patent laws.”*

– Sue A. Purvis (Innovation and Outreach Coordinator), “The Role of the Patent Examiner,” USPTO (NY Region), May 22, 2013<sup>4</sup>

---

**The Galactic Patent Office:** The role of the Concierge with regard to Patents is very similar to the role of the U.S. Patent and Trademark Office (USPTO); the Concierge serves both an adversarial and advisory role with regard to Patents (and throughout the game in general). The Concierge is adversarial to Patents (and players and positions) in that the Concierge serves as the critical eye, the ‘devil’s advocate,’ ‘Big Brother,’ the personification of Entropy, and the limiting factor to prevent abuse of the Patent Interpretation (or anything else).

As an initial principle, there are no perfect, indestructible, final, ultimate, or unstoppable technologies (see Patently Off-limits and Un-patentable discussions in 3 Patents, p. 750, *infra*), everything has a flaw, however microscopic – even Superman had a well-known vulnerability. The Concierge is advisory in the sense that the Concierge will communicate with players and help to balance technologies, and make rulings on particular situations when they arise in relation to the Patent as the game goes; the Concierge is there to facilitate the game and hopefully, no player or group of players will take umbrage to the Concierge.

- **Fuzzy Things:** The main point of the Effects and Costs statements in the Patent is to describe the major attributes of the technology. They do not have to be all inclusive, rather, they have to be sufficient to form a guide or general picture of the technology; some things may be assumed, and the Concierge will fill in the details of the technology through notes in the User Manual. Each Effect or Cost statement should relate to one attribute and be effectively, one statement, but when necessary, may contain two closely related statements.
- **Balancing the Pin:** Obviously, the point of developing a technology is to gain an advantage; positions are seeking to gain an advantage from a new technology. To obtain the new technology, the position is required to develop and expend valuable resources and time.

In any game where players may develop special skills, house specializations, magic spells, or technology, the development of the ‘whateveritis’ creates a special exclusive exception to the rules (which form only the baseline of the game) for that player or position in exchange for the cost of resources and the elimination of other possibilities.

Balance should not be construed to mean that there will be no advantage from the technology, or even that it’s fair to the rest of the positions in the game. *Balance means a fair (and playable) advantage gained for the effort expended.* Balancing in GGDM terms is not an equal sign in an equation; the resulting equation must be unbalanced to have gain (e.g., synergy, emergence, profit, capabilities, 1+2 must equal 5). Positions are free to expend effort in whatever direction they choose, but no position can expend major effort in every direction at once. The Concierge is free to adjust the Effects and Costs sections as necessary to balance the Patent application and make the proposed technology playable (playability is very important) prior to the processing of the Patent. After the Patent is successfully processed, the Patent may not be adjusted or changed (so players need not fear that the technology will be changed after they begin using it), only the User Manual is available for the Concierge (and only the Concierge) to enter play notes as the game continues.

- ✓ Darkness of Silverfall (DOS) is a free online PBEM game that I played back around the millennia. The game hosts up to 30 players, and the premise of the game is that the Dark Lord has installed ten ‘battlestations’ near the center of the play area to create a black hole that will pull in all planets in the game area. A toothless non-player supreme counsel of Wizards who own the five neutral trading planets near the center, need the player races to find and destroy the Battlestations before the singularity catastrophe. All’s well, because it never happens, the players cooperate in the beginning of the game and launch their attacks in time (it’s a good mechanic to encourage player diplomacy); after the Dark Lord is stopped it’s a free-for-all interstellar war to the end of the game. The problem with the game is the structure. The Wizards dole out rewards and special technologies (the only technological progression) throughout the game based on criteria such as number of ships, money, industry, etc. to the positions with the least (to level up, catch up), the ‘most mediocre’ (to push them forward) and the most/best (to reward them for achievement). This creates a situation where positions get rewarded for doing poorly in the game as well as for excelling, or being average. The pinball-game logic of this was that DOS was originally a pay-to-play PBM game and the rewards were to keep players paying instead of dropping out.

GGDM is structured much differently, I do not anticipate this being an issue, but it is an argument for why the Concierge is *not* ‘rewarding’ positions, is not ‘fair’ (in a childish sense), and is *not* to ‘level-up’ game positions through Interventions or Patents (or any other Interpretation). The Concierge will not issue ‘make up’ calls like an umpire or referee in sports.

- ✓ See previous Darkness of Silverfall discussion regarding cheating, 1 The Sidereal Stage, p. 111, *supra*, and spatial injustice discussion, Never Achievable, 3 Expansion, p. 908, *infra*.
- Razor Blade Floating on Water: The Concierge may take into account the circumstances of the game and any relevant factors at the time the Patent application is submitted. These may include, but are not limited to, the industrial base of the position (manufacturing expertise), the types and numbers of Applications on the Matrix at that time (e.g., a position who has

90% weapons and energy Applications, will have a difficult time developing a new colony ship technology), Fundamental Realities, Government Titles (and sociopolitical factors), the type of Patent under consideration, and other Patents and consistency with previous Patents, and anything else that seems relevant.

- ✓ Maria von Wedemeyer was the fiancé of Dietrich von Bonhoeffer who was executed by the Nazis about a month before the Germans surrendered. She studied math at the University of Göttingen (according to the NY Times and encyclopedia.com) and possibly at Bryn Mawr College (according to Elizabeth Raum), and emigrated to the United States in 1948 (Bryn Mawr College is located in Pennsylvania, so both could be true). Thereafter, she worked for Remington Rand and Honeywell corporations on minicomputers, pioneering computer science, especially in emulation capability. She died in 1977, but her posthumously published collection of love letters provides an important historical source on Dietrich Bonhoeffer.<sup>5</sup>

Page | 737

The lives of many German citizens intersect in this way in post-WWII between socio-political circumstances of their youth or early careers and later importance in contribution to technological and scientific advances wherever they happened to be living after the war. For these people, the choice of science and technology was an act against the futility and human failings of their birth nation and western civilization in their youth, math in particular is held by scientists, engineers and technologists to be the code of the universe and not of humanity, free of party ideology and failings.

---

*“The politicization of the education system essentially replaced academic tradition and excellence with ideological adherence and trappings...”*

– from Wikipedia Article, “German Nuclear Weapon Program,” captured May 22, 2018 <sup>6</sup>

---

**Deutsche Physik:** One of the best-known and most thoroughly-studied examples is the failed German Nuclear Weapon Program during WWII. Much blame has centered on the politicization of German academia where, as well as, causing the emigration flight of certain famous scientists and a generation of lesser known colleagues from Germany in the 1930s, they sought to make physics ‘German’ or ‘Aryan.’

- ✓ Nazi ideology had a problem – the most important discoveries in physics in the last three generations were made by people from groups they considered racially inferior. Subtracting the contributions of the ‘racially inferior’ German colleagues, German science in any field was not demonstrative of racial superiority. Remember Jesse Owens at the 1936 Berlin Olympics? It was all about racial superiority.

In place of tradition and critical excellence, the anti-Semite, *Deutsche Physik* movement – not just a club for colleagues or to insure scientific loyalty to the state – attempted to make physics ‘Aryan’ and to ignore or discount all non-Germanic contributions (especially or mainly from Jewish scientists) to physical sciences, by ignoring relativity and quantum physics.

Heisenberg, the 1932 Nobel Prize laureate in Physics, was called a “white Jew” by Himmler (a man whose education was *agriculture studies*) in an SS newspaper editorial, for lecturing on Albert Einstein’s theory of relativity; Himmler suggested he should be made to disappear. *Id.*

- ✓ Wikipedia article cites to: “Klaus Hentschel (Editor) and Ann M. Hentschel (Editorial Assistant and Translator) Physics and National Socialism: An Anthology of Primary Sources (Birkhäuser, 1996). In this book, see: Document No. 55 ‘White Jews’ in Science [15 July 1937] pp. 152–157.”

Only racists would concern themselves with the irrelevant race and ethnicity of a scientific discoverer or inventor. Although the German *Deutsche Physik* took it to extremes, they were not the first to confuse science with social policy or nationalism or alleged racial superiority:

Page | 738

- ✓ “Despite the second Nobel Prize and an invitation to the first Solvay Conference with the world’s leading physicists, including Einstein, Poincaré and Planck, 1911 became a dark year in Marie’s life. In two smear campaigns she was to experience the inconstancy of the French press. The first was started on 16 November 1910, when, by an article in *Le Figaro*, it became known that she was willing to be nominated for election to *l’Académie des Sciences*. Examples of factors other than merit deciding an election did exist, but Marie herself and her eminent research colleagues seemed to have considered that with her exceptionally brilliant scientific merits, her election was self-evident. Notwithstanding, it turned out that it was not merit that was decisive. The dark underlying currents of anti-Semitism, prejudice against women, xenophobia and even anti-science attitudes that existed in French society came welling up to the surface.

Normally the election was of no interest to the press. The most rabid paper was the ultra-nationalistic and anti-Semitic *L’Action Française*, which was led by Léon Daudet, the son of the writer Alphonse Daudet. [Maj. Alfred] Dreyfus had got redress for his wrongs in 1906 and had been decorated with the Legion of Honour, but in the eyes of the groups who had been against him during his trial, he was still guilty, was still ‘the Jewish traitor.’ The pro-Dreyfus groups who had supported his cause were suspect and the scientists who were supporting Marie were among them. Jokes in bad taste alternated with outrageous accusations. It was said that in her career, Pierre’s research had given her a free ride. She came from Poland, though admittedly she was formally a Catholic but her name Sklodowska indicated that she might be of Jewish origin, and so on. A week before the election, an opposing candidate, Édouard Branly, was launched.

The vote on January 23, 1911 was taken in the presence of journalists, photographers and hordes of the curious. The election took place in a tumultuous atmosphere. In the first round Marie lost by one vote, in the second by two. In all, fifty-eight votes were cast. A Nobel Prize in 1903 and support from prominent researchers such as Jean Perrin, Henri Poincaré, Paul Appell and the permanent secretary of the *Académie*, Gaston Darboux, were not sufficient to make the *Académie* open its doors. This event attracted international attention and indignation. It deeply wounded both Marie and indeed Édouard Branly, too, himself a well-merited researcher.” – Nanny Fröman, “Marie and Pierre Curie and the discovery of polonium and radium,” nobelprize.org, captured October 31, 2018.

We have this 20<sup>th</sup> Century history behind us, but can anyone say with certainty that this will never happen again? There is a brand of lunacy in it that would be dismissed as ludicrous, except that we know it happened (see 1 Dreamtime generally, *supra*, for Facts discussion). And that the same sorts of things happen over and over again.

- ✓ Heisenberg, crucial to *The Man in the High Castle*, was captured May 1, 1945.

The development of the nuclear weapon during and before WWII would be a milestone, equivalent to a Patent in GGDM (if it wasn't a pregame technology), discovery of fission in 1938 might be a Research Piece or Group. The Concierge has many Interventional tools available to simulate this sort of situation in GGDM, throughout the technology process and in Colleges.

---

*“Science is a collaborative enterprise spanning the generations. When it permits us to see the far side of some new horizon, we remember those who prepared the way, seeing for them also.” – Carl Sagan, Cosmos, Episode 5*

---

**Operational Qualities:** Each Patent in GGDM is both a collaborative effort and a new horizon in the current game universe.

As noted previously, the Operational Quality assigned to the new technology has a major effect on the rest of the Patent. If you take a moment to think about the range of all of the possible technological ideas; all of those ideas can be broadly classified into two categories (just as we broadly classify all life as either plant or animal): technologies that introduce major new physical items or things or devices, and technologies that improve or enhance or add to existing physical items, things, or devices.

- ✓ This is similar to the Primal States, which consists of those species that were already in the Galactic Space and those which enter the Galactic Space at or near the beginning of the game. Each category is then divided into three possible Primal States.

Within this game, each of those two categories is further divided into two subcategories and those four subcategories form the four ‘types’ of technologies available, and define the Operational Qualities of those technologies, as follows:

- **Physical Item Technologies (PITs):** Physical Item Technologies introduce into the game the capability to produce new physical items, mainly ships, that function as the major units of the game (see View from a Height, 1 Construction, p. 660, *supra*, for discussion of game units concept). Generally, these physical items are intended to be mass produced and available throughout the entire position, wherever the capability exists to produce them. Any Patent for a ship *must have at least one Stardrive Application*.
  - ✓ Patents for Physical Item Technologies must have at least two and no more than seven Applications, and do not have an automatic ‘base cost’ (in RPs), rather, due to the variable nature of the possible physical items, the cost will be determined by the Concierge. PIT Patents include and assume all of the minor and lesser technologies required to make the new physical item work within the game.
  - ✓ ‘Base Cost’ as used here refers to the Cost section of the Patent where cost per unit is set in RPs; ‘base cost’ is simply a relative RPs cost guideline for Patents, it *does not* refer to any cost in RPs to prosecute the Patent (there is **no RP cost** to activate the Technology Power for the purpose of Patent prosecution, see Back to the Drawing Board, 3 Patents, p. 748, *infra*.) The ‘cost’ of Patent Prosecution is getting Applications on the Matrix and Technology Power activations.
  - ✓ A PIT Patent for any starship may not be prosecuted (or bought with IPs during the setup process) unless the position has first obtained a stardrive patent (i.e. the Generic Stardrive Existential Patent), because what is a starship without a stardrive? Further,

only the Scout Ship Existential Patent may be obtained if the position does not have the Ship System Existential Patent.

- Continuous Operational Technologies (COTs): A Continuous Operational Technology is one that presents a minor, non-expendable, improvement in an existing technology (i.e. Patent), e.g., gradual improvements in ship speed, or industrial production, or the range of an existing weapons system. Continuous Operational Technologies *may not add new capabilities* to units or installations, only improve the performance or output of existing systems/units.
  - ✓ Continuous Operational Technology Patents may only have two **Effects** and must specify another previously successful Patent for a Physical Item Technology, Enhancement Technology or Continuous Operational Technology, to which the COT Patent is related. The COT Patent may not be submitted in the same Regular Turn as the Patent upon which it depends. Generally speaking, the ‘base cost’ of the COT Patent is the cost of developing it, and as such, *in most cases*, no RP cost will be assigned per unit to ‘upgrade’ the units, installations or enhancements to which the COT Patent relates.<sup>7</sup> The Concierge may take into account, however, the number of current items to be affected, and may impose minimal RPs cost to ‘balance’ the COT Patent. Time delays while upgrading are also an option for balancing the proposed COT Patent, e.g., upgrade when ships return.
  - ✓ Because Effects must equal the number of Applications minus one, this means that all COT Patents will use three Applications, no more, no less. See Effects, 1 Patents, p. 731, *supra*.
    - Delays in implementation of new, imperfect technology and improvements are at the core of Arthur C. Clark’s classic 1951 short story, “Superiority,” where the vastly technologically superior human fleets were overwhelmed by less advanced, but more numerous attacking aliens, leading to the surrender of Earth. Everyone blamed the R&D department for the humiliating loss. A parallel of Clarke’s “Superiority” was, perhaps inadvertently, played out in the 1981 Eurisko AI situation quoted at length in Imperial Admiral Eurisko, 4 Colleges, p. 512, *supra*. See also WWII history.
- Enhancement Technologies (ETs): Enhancement Technology is the only means to add new capabilities or ‘dimensions’ to existing physical items, colonies, and colony installations technologies. Such enhancements may be expendable, like Ship Missiles, or may require a unit upgrade cost for the existing ships and installations to use the new capability. Most things built on colonies, such as industry and defenses, will be colony enhancements and are thus Enhancement Technologies.
  - ✓ The easiest difference between a COT and an ET is that a COT adds ‘more of the same’ whereas an ET adds ‘something new’ to an existing technology or game unit. There could be some fuzzy borderline cases.
  - ✓ Enhancement Technology Patents must use at least two Applications. If an ET Patent is not a colony installation or if it improves on existing colony installations, it is required to list an existing Patent upon which it is based, and an ET Patent may not be processed in the same turn that the Patent upon which it is based is approved. The base cost in RPs of an ET Patent is 5 RPs times the number of Effects used in the ET

Patent. An ET Patent may use between two and four Applications (hence, have one to three Effects).

- Technological Devices (TDs): Technological Devices are the ultra-powerful, extraordinary (within the setting), possibly one-of-a-kind or rare physical items that are not generally capable of being mass produced. For example, the dynamite-stick like Illudium Q-36 Explosive Space Modulator. Technological Devices are sometimes installations on colonies, sometimes they can be enhancements to existing ships, and sometimes, they can be a third major unit in the game. The key to Technological Devices is the think BIG.

- ✓ Technological Device Patents require at least five, and no more than nine Applications, and have a base cost of 50 RPs times the number of Applications for production of each such device. Additionally, the Cost section must contain a statement limiting the number of such items on some logical basis, such as one per planet, one per system, or even one of a kind, for example. This may involve some storytelling.<sup>8</sup>

Technological Device Patents can act as either Physical Item Technologies (PIT) or Enhancement Technologies (ET), *ut supra*. Not all Technological Devices have to be massive weapons or useable as a weapon, but they usually are in video science-fiction:

- ✓ “Frequently, the Wave Motion Gun [as a TV trope/archetype big weapon] is made of Lost Technology, or is an experimental prototype, but sometimes they’re a dime a dozen. It also explains how a small fleet can win consistently against enemies that grossly outnumber them: the defense units just have to hold their ground until the Gun(s) is ready to fire. Invariably, just before firing, The Captain has to order the attack.” – TV Tropes (tvtropes.org), “Wave Motion Gun,” December 19, 2018 (because the captain’s only job is to look heroic and order the big gun to fire! – like Lt. Tawny Madison in *Galaxy Quest* (1999)<sup>9</sup>).

As mentioned in *View from a Height*, 1 Construction, p. 660, *supra*, the game has two major units: Colonies and Ships. Typically, something that would already be considered a unit in the game will not be a Technological Device, no matter how big. Therefore, for example, a Death Star is a starship, and no matter how big, it was intended to be mass produced (e.g., DS-1, DS-2) and the only production limitation was cost and time, so it would not be considered a Technological Device. However, the main weapon of DS-1 that could destroy a planet might be a Technological Device (acting as an ET). *The line can be a bit fuzzy*. On the other end of the scale, the Magogg Worldship in the *Andromeda* television series, consisting of twenty planets around a captive artificial sun, is one of a kind and would be a technological device (even if it is a ‘generation ship,’ a PIT) as would its main weapon, the Point Singularity Projector, that fired miniature black holes (as an ET) in that universe.

---

*“The word enigma didn’t jump from referring to riddles to referring to people. In between those uses, it was (and still is) applied to things that puzzle people. Egypt’s meticulously constructed Pyramids of Giza or a theory of quantum physics, for example, might be described as enigmas. In these uses, the meaning is simply a figurative extension of the original ‘riddle’ sense.”*

– Merriam-Webster online dictionary article, “Are you an enigma?”

---

**Enigma:** Technological Devices in GGDM border into the area of ‘enigmas’ – their rarity, uniqueness, unknown technology and outlandishness make them enigmas to future populations in the game universe. Technological devices can be small things, but taken to extremes in science-fiction imagination, they are often monumental, shading over into the interstellar neo-Egyptian trope of ‘monument builders.’

- ✓ “Champollion was overwhelmed by the grandeur which surrounded him. ‘It is the union,’ he said ‘of grace and majesty in the highest degree. We in Europe are only dwarfs. No nation, ancient or modern, has conceived the art of architecture on such a sublime, great and imposing style as the ancient Egyptians. They ordered everything to be done for people who are 100 feet high.’” – Cosmos, Episode 12.

Page | 742

A couple of modern real world strange musical instruments provide a range of examples related to the ‘Technological Devices’ in the GGDM sense here.

- ✓ While the Great Stalacpipe Organ is one of a range of lithophone instruments, it is a unique, one-of-a-kind instrument, it exists only in the Luna Caverns in Virginia. Because of its location-specific construction, it will not be mass produced. Some primate shaman will find it 100,000 years from now and construct a religion around it.
- ✓ Wintergaren’s Marble Machine could theoretically be mass-produced, but it will not be; it is a unique hand-constructed instrument for that band, and there is no market for it outside the band that constructed it. They have gained some notoriety from it, some trademark identity, and there is a video on YouTube.
- ✓ The strange-looking hurdy-gurdy, on the other hand, has been reduced in size from Medieval times and modern mass produced and is a staple of folk music festivals. There is even a fine young lady singer who plays the hurdy-gurdy and has adopted the instrument as part of her stage name, search for Patty Gurdy videos on YouTube.
- ✓ Finally, instrumentalist William Close created the Earth Harp, the largest stringed instrument in the world with 300m strings. Though the original one-of-a-kind instrument was constructed in Santa Monica, California, the instrument has been replicated and adapted to stage performance by a few musical groups.

The TARDIS is a one-of-a-kind, not-capable-of-being-reproduced, technological device in the Dr. Who universe. There were once many TARDIS ships – as shown in the repair shop scene where many TARDIS ships were lined against a wall. The TARDIS is considered the “most powerful warship in the universe” despite having no weapons or armor. Dr. Who features a number of Technological Devices, usually universe-destroying weapons – sort of a fetish of the show – such as The Moment, the handheld De-Mat Gun, the Reality Bomb, the Pandora – and when the TARDIS explodes, it destroys the universe and causes a second Big Bang.

- ✓ “Trillian deduces that the Krikketers have been manipulated, reasoning that the people of Krikkit could not simultaneously be smart enough to develop their ultimate weapon – a bomb that could destroy every star in the universe – while also being stupid enough not to realize that this weapon would also destroy them. The characters discover that the true force behind the war has been the supercomputer Hactar. Previously built to serve a war-faring species, Hactar was tasked to build a supernova-bomb that would link the cores of every sun in the Universe together at the press of a button and cause the end of the Universe.” – from Wikipedia article, “Life, The Universe, and Everything,” August 15, 2019.

- Life, The Universe and Everything (1982) was originally intended as a Dr. Who serial. As 1982 was near the end of the Cold War (though we didn't know it at the time), doubtless the Krikkiters weapon is a parody of the global obsession with nuclear weapons on Earth.

Control of massive natural phenomenon may also constitute a TD or require a TD Patent, for example, the Logopolitans control of CVEs (Charged Vacuum Emboitment) which they used (via Block Transfer Computation) to attempt to stave off the heat death of their universe in the Fourth Dr. Who episodes. This is analogous to someone on Earth, either now or in ancient times, having the ability through a device to control the movement of Luna. In Stargate SG-1 episode “Demons” (1999), the ruler of a village on a medieval Christian world had a ring on his finger that could very precisely control the weather, though there might have been many of those in the universe, it was an enigma and a TD to that setting.

---

*“Their opinion might be roughly summarized in the words of Arnold Toynbee: ‘With the increase in our power, our sense of responsibility and our sense of distress increases.’ Toynbee has said that the growth of science and technology makes more acute the disparity between the real and the ideal.”*

– Brian Aldiss, [Galactic Empires Vol. 1](#) <sup>10</sup>

---

**The Rive:** Has technology replaced the gods in the irony of modern humanity? That we have so much, but also are so little – secular removal of the parental god has left us small people on a small planet – and are seemingly very distant from our ideals. How will this play end? We at least avoided burning down the house so far, but ...

- ✓ “The expression cosmic irony or ‘irony of fate’ stems from the notion that the gods (or the Fates) are amusing themselves by toying with the minds of mortals with deliberate ironic intent. Closely connected with situational irony, it arises from sharp contrasts between reality and human ideals, or between human intentions and actual results. The resulting situation is poignantly contrary to what was expected or intended.” – from Wikipedia article, “Irony,” January 22, 2019.

I can see at least a plausible argument that Toynbee’s observation of disparity is the origin of the dominance of modern ironic humor, in frustrated humor we sarcastically say what would have been ideal (e.g., ‘Nice play, but he forgot something important – the puck!’ or the common laconic-ironic responses, ‘Not!’, ‘Dream on!’, ‘Right!’ (or Bill Cosby’s “Riiiiight!”) or ‘Uh-huh!’) in opposition to what actually happened or is expected to actually happen. We have been an increasingly frustrated people for the last three centuries and it almost killed us, and may yet.

Indeed, frustration is the cause of most sapient distress. We can see how things should be, should work, *ought to be*, in an ideal world or even the ideal way the job in front of us should proceed, and then what actually happens, *what is*. Mr. Toynbee had an early idea of what has become clearer now. Our ancestors either accepted that the chaos in their lives was unexplainable, or bad combinations of random chance, or more likely, invented mythopoeic explanations for it. But the chaos is too regular, too petty, and too predictable and certainly is a phenomena that we can now contemplate. We now have the framework to recognize the ‘fracture’ of the original order of the universe that are the emergences called life and sapience (see Order of Genesis, 1 Order, p. 522, *supra*), and the fault line is the petty chaos of our daily lives, all the stupid little

things that happen almost predictably in the pettiest ways. This fracture is both the frustration of sapience and the special relationship of sapience to the universe.

- ✓ “‘Do not create an ideology out of something that a young girl has to say,’ says Naomi Seibt, apparently without a trace of irony.” – Harry Cockburn, “Anti-Greta: Far-right groups trying to turn teenager into climate change-denying version of Greta Thunberg,” *The Independent*, February 25, 2020.<sup>11</sup>
- ✓ See Turbulence of Being discussion, 1 Entropy, p. 223, *supra*.

---

*“In the ‘Bad Nauheim Debate’ (1920) between Einstein and (among others) Philipp Lenard, the latter stated the following objections: He criticized the lack of ‘illustrativeness’ of Einstein’s version of relativity, a condition that he suggested could only be met by an aether theory. Einstein responded that for physicists the content of ‘illustrativeness’ or ‘common sense’ had changed in time, so it could no longer be used as a criterion for the validity of a physical theory. Lenard also argued that with his relativistic theory of gravity Einstein had tacitly reintroduced the aether under the name ‘space.’ While this charge was rejected (among others) by Hermann Weyl, in an inaugural address given at the University of Leiden in 1920, shortly after the Bad Nauheim debates, Einstein himself acknowledged that according to his general theory of relativity, so-called ‘empty space’ possesses physical properties that influence matter and vice versa.”*

– from Wikipedia article, “Criticism of the theory of relativity,” captured September 4, 2019<sup>12</sup>

---

## Endnotes.

<sup>1</sup> Commentary: This latter happens to me all the time. Sometimes I see an article that has a striking idea that is new to me, e.g., Kate Becker’s ‘quantum intuition’ article, but most often in designing GGDM, I find articles or stumble on quotes or writings that support, accord with, or add to commentary and ideas I had already expressed years ago in the GGDM text. Do I suffer from confirmation bias? Or am I part of a larger churning process where multiple intellectuals arrive at the same ideas, conclusions, insights, concepts independently from their own angles, publish them and others publish them as reinforcement or addendum to their own somewhat similar thinking? Is anything new?

<sup>2</sup> Citation: “But wealth and fame came with burdens. Dahl was reportedly sued by one of the Pet Rock’s original investors and had to pay a six-figure settlement. Gimmick inventors crawled out of the woodwork to pepper him with the next Pet Rock. ‘I’m sick of the whole damn thing,’ he told the Houston Chronicle. ‘Most inventors call me because they’ve come up with their own novelty idea. A pet stick or pet poop or pet gravel. I’ve seen them all – they’re all bad. ...’ ‘There’s a bizarre lunatic fringe who feel I owe them a living. Sometimes I look back and wonder if my life wouldn’t have been simpler if I hadn’t done it.’ The Chronicle dispassionately summarized his life, post-Pet Rock: ‘Dahl got rich, got cocky, had a damn good time, opened a bar, bought a big house, drank too much.’ He ‘sold his bar, dreamed up a few clever but cataclysmic marketing flops, took up golf, got a real job, sued, got sued, felt betrayed.’” – Reid Creager, “Timing, Marketing Made the Pet Rock Roll,” *Inventor’s Digest*, July 1, 2017.

<sup>3</sup> Citation: Text from this article was quoted at the bottom of the preceding *Inventor’s Digest* article without a link or date, referencing just “The blog Patent Club.” I found the original Patent Club article by Google search at <https://lilykang96.wordpress.com/2014/03/15/the-pet-rock-a-story-of-invention-and-creativity/>. Presumably the author is ‘lily kang 96’ as no other author is attributed. No qualifications were provided for the author, the blog’s About page is just a standard template and the blog seems to be inactive since December 15, 2014.

- ✓ In presenting this, I exercise my own judgment. What Lily Kang 96 states seems to accord with my own *non-attorney* understanding of patent law in the U.S. as a litigation paralegal of many years.

<sup>4</sup> Citation: [https://www.uspto.gov/sites/default/files/about/offices/ous/PatentExaminerRole\\_20130514.pdf](https://www.uspto.gov/sites/default/files/about/offices/ous/PatentExaminerRole_20130514.pdf).

<sup>5</sup> Commentary & Citation: Information on Maria von Wedemeyer is sparse on the internet, information here comes from articles on encyclopedia.com (mostly repeating the NYT obituary article, available free online in NYT archives) and awesomestories.com (captured May 26, 2019), the latter of which cites extensively to (and quotes) Elizabeth Raum, *Dietrich Bonhoeffer: Called by God* (2002).

<sup>6</sup> Commentary: Sort of like working on the White House staff.

<sup>7</sup> Commentary: The most pervasive current example of a COT are the constant, annoying, interminable, mostly unnecessary ‘upgrades’ and ‘updates’ pushed out by software and OS providers for their products to justify their jobs.

<sup>8</sup> Commentary: *Godsfire* boardgame was published in 1976 by Metagaming, a year after they published *Stellar Conquest*. *Godsfire* is and was considered one of the most complex and ‘realistic’ strategic interstellar conflict games ever designed. Unlike most war games, and much like GGDM, it focused on politics, economics and sociology as much as the warfare; it also had a three-dimensional movement system on a flat game board. I have never played *Godsfire* or read the rules (I don’t own a copy and have not seen one in many years); I looked at a copy of it briefly in 1985 when I was playing *Stellar Conquest* at The Caisson E-club on Ft. Sill, OK, but it was too complicated to learn and play quickly so the gaming group passed on it. However, the game was legend, especially for the *Godsfire* mechanic: Too many ships equipped with *Stardrive* in the same system at the same time could tear a rip in reality and release the catastrophic *Godsfire* event which would explosively flood the entire star cluster with extradimensional radiation. This is an example of a TD-like reasonable restriction of numbers of devices in a system.

- ✓ I have become aware from reading commentaries about *Godsfire* that GGDM may be considered in many respects similar to that vaunted boardgame. Three insightful comments by BGG user *cannoneer* were striking: The first that the space combat system is pedestrian once you get past the unique 3D movement system, and second that the designer abstracted the right things; he also noted that the game is better political theory than game. BGG user Rick Smith (from Canada) notes that “The designer innovates, innovates, innovates, but things don’t QUITE come together” (emphasis in original). All of these things I sadly fear may be true also of GGDM.

<sup>9</sup> Commentary: I usually don’t go for comedy movies, science-fiction themed or otherwise, but *Galaxy Quest* was surprisingly well done. This is one instance where I agree with the critics.

- ✓ I’ve never been a sitcom viewer, not even when I was young. Sitcoms are cheap humor punctuated with fake audience laugh tracks, and like cheap wine, you get what you pay for. And the cheapest humor is to make fun of intelligent, educated, career adults and prodigal, gifted youth.

<sup>10</sup> Commentary: This quote is referenced in 2112 *Absurd Words*, *supra*.

<sup>11</sup> Commentary: When I read this, I thought, did someone write that line for her? Did she read it somewhere? Did she not think it sounded odd when she said it? Has she not heard of Mary who claimed she was still a virgin?

<sup>12</sup> Citation: “On the other hand, Einstein stresses that illustrativeness is a changing concept. The Galilean mechanics is for us the highest point of illustrativeness, while it was very non-illustrative for Galileo’s contemporaries. And in the present we find electricians, for whom nothing is more illustrative than the electric field, and for whom the electrical phenomena even become images for mechanical ones. Thus one cannot use such a changing concept for or against the theory. To the example of the decelerating train he remarks, that this is without any doubt an interaction between masses, and for the success it is irrelevant, which mass is moved against the other. To let decide the ‘common sense’ in this question, is no less problematic as it was before in respect to illustrativeness. To the example of the rotational motion it has to be said, that the role of the speed of light in the general theory of relativity is completely different as in the special theory, and that the first requires no constant speed of light at all. – Nearly all other speakers in the debate agreed with Einstein in the essential points – for example von Laue, Mie (who responded to Lenard that the aether was abolished not only by the theory of relativity, but already three decades earlier by H. A. Lorentz) and particularly inspired by Born, who feels attracted to Einstein’s theory just because of its illustrativeness.” – translation from K. Körner, *Die 86. Versammlung der Deutscher Naturforscher und Ärzte in Bad Nauheim* (1921), *Zeitschrift für Mathematischen und Naturwissenschaftlichen Unterricht*, 52, pp. 79-84 (translated 81-82) on Wikisource at [https://en.wikisource.org/wiki/Translation:The\\_Bad\\_Nauheim\\_Debate](https://en.wikisource.org/wiki/Translation:The_Bad_Nauheim_Debate).

*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*  
*See Appendix TECH – Technology Progress*

*“If nature has made any one thing less susceptible than all others of exclusive property, it is the action of the thinking power called an idea, which an individual may exclusively possess as long as he keeps it to himself; but the moment it is divulged, it forces itself into the possession of everyone, and the receiver cannot dispossess himself of it. Its peculiar character, too, is that no one possesses the less, because every other possesses the whole of it. He who receives an idea from me, receives instruction himself without lessening mine; as he who lights his taper at mine, receives light without darkening me.*

*That ideas should freely spread from one to another over the globe, for the moral and mutual instruction of man, and improvement of his condition, seems to have been peculiarly and benevolently designed by nature, when she made them, like fire, expansible over all space, without lessening their density at any point, and like the air in which we breathe, move, and have our physical being, incapable of confinement or exclusive appropriation. Inventions then cannot, in nature, be a subject of property.” – Thomas Jefferson <sup>1</sup>*

**Learning to Make Fire:** Isn't there something very odd about the nature of information – something profound and sublime that we have rediscovered over the last two centuries? That there can be more of something without anyone being lessened by it – sort of like procreation of life except that information doesn't have the same relationship apparently to the arrow of time. There is, of course, a well-established connection between life and information, that is, genes, learning, civilization, sensory processing, psychogenesis, and the abstractions of sapience and thus, in a – I guess – neo-Platonic sense, it is not surprising that they share the same properties.

- ✓ If I email you a document, I am not lessened by it, in fact, I may be better off, because if mine is accidentally deleted, you may return the favor rescuing me.

And as we discovered in the last century, information exists in a very different framework in our universe. Which probably means that we exist in a different framework in our universe as well. See additional discussion, 2 Expansion, pp. 890-897, *infra*, see also Order of Genesis discussion, 1 Order, p. 522, *supra*. It seems/feels like there is something about it right there in front of us, but we cannot yet grasp it.

Obviously, everyone learned to make fire eventually, and none were lessened for it, except perhaps those whose original power and position came from holding the exclusive secret of making fire and those who were careless.

- ✓ Our mythopoeic ancestors inherently recognized and tried to explain – in mystic ways – the nature of information. It is no light coincidence that there were ancient gods, spirits and such representing fire, knowledge, invention, light, teaching, education, craft. But rarely do we grasp or express the importance of this in development of civilization, rather, we tend to be *dismissive and derisive toward pre-monotheistic religions* when not presented as adventure-fiction trope (e.g., Jason and the Argonauts (movie 1963, miniseries 2000), Clash of the Titans (1981, 2010), Thor (2011), Ulysses (1954), etc.). Adventure-fiction stories are non-threatening and can be dismissed.

Ideas and information tend to be indifferent to long term monopolization. Ideas and information are not zero sum. Power of any kind that depends on exclusive knowledge is tenuous at best (as

Mr. Spock noted, military secrets are the most fleeting kind, ST:OS “The Enterprise Incident”); for example, high school students in Australia have manufactured Martin Shkreli’s \$750 per dose Daraprim using non-industrial school chemicals, processes and equipment, for just \$2 per dose (Fiona Macdonald, “Students have made Martin Shkreli’s \$750 drug in their chem lab for just \$2,” sciencealert.com, December 2, 2016). The purity of their product was confirmed spectrographically in a lab, presented to the Royal Australian Chemical Society, and published online.<sup>2</sup>

*“You can’t connect the dots looking forward; you can only connect them looking backwards. So you have to trust that the dots will somehow connect in your future. You have to trust in something – your gut, destiny, life, karma, whatever. Because believing that the dots will connect down the road will give you the confidence to follow your heart even when it leads you off the well-worn path; and that will make all the difference.”*

– Steve Jobs, Stanford University Commencement Speech, June 2005  
(video available on YouTube)

**Patent Prosecution:** Patent Prosecution is the process by which the connectivity of all of the Applications in the Patent are tested on the Era Matrix.

- **Connecting the Dots:** During the final processing of the Patent Application, the Concierge will check to see if all of the Applications listed on the Patent Theory section (by location) are connected. Only unconnected Applications will be tested; previously connected Applications are ignored. The base chance of connecting any two Applications is 50%. The connectivity of all listed Applications will be tested on the Era Matrix even if the Patent ultimately fails. Once any two Applications are connected, they are permanently connected.
- **Stamp of Approval:** If all Applications on the Patent are connected on the Era Matrix, forming a line exactly in the order specified in the Theory (and approved by the Concierge), the Patent is successful and a new technology is introduced into the game. It is possible for a position to submit a Patent for links that have all already been tested, and thus have an automatic Patent (after Concierge approval), however, as indicated in the following Eras section, that may not always be a good strategy. A new Patent may be used on the Regular Turn after it is approved and also must serve as the Interpretation (but not published on the forums) for the Technology Power activation for the purpose of Patent Prosecution on the Regular Turn of the Patent’s approval.
- **Patently Baaaad:** The Patent will fail if any two Applications fail to connect. A failed Patent cannot be used as an Interpretation on that Regular Turn; instead, the News Event required when submitting a Patent, see Patent Process, 1 Patents, p. 728, *supra*, will be used. Connections established by the Patent check will not be lost by the failure of the Patent.

A failed Patent may be submitted again on any subsequent turn by *another activation of the Technology Power* for the purposes of Patent Prosecution. A position may alter or change the failed Patent prior to resubmission, and each Patent Application will be treated by the Concierge as a new Patent Application for review and balancing purposes. If a link between Applications is tried enough times, it will eventually connect, and the connection only needs to be made once.

- ✓ Modification and resubmission are necessary for players to be able to ‘invent’ new technologies to move the game. This game does not use a ‘technology tree’ and there is no ‘ultimate,’ final, top-level technology.
  - ✓ Successful Patents are ‘locked’ and cannot be changed – ever – or disrupted.
- Back to the Drawing Board: A Patent prosecution is different from a Development Attempt in that it will not continue automatically from turn to turn until successful or disrupted. However, Patents don’t cost RPs and cannot be disrupted.

**Capt. Kirk:** *All right, Harry, explain. How did you get here? We left you in custody after that affair on the Rigel mining planet.*

**Harry Mudd:** *Yes, well, I organised a technical information service bringing modern industrial techniques to backward planets, making available certain valuable patents to struggling young civilisations throughout the galaxy.*

**Capt. Kirk:** *Did you pay royalties to the owners of those patents?*

**Harry Mudd:** *Well, actually, Kirk, as a defender of the free enterprise system, I found myself in a rather ambiguous conflict as a matter of principle.*

**Mr. Spock:** *He did not pay royalties.*

**Harry Mudd:** *Knowledge, sir, should be free to all.*

– Star Trek, “I, Mudd” (1967) <sup>3</sup>

**Letters Patent:** A Patent is the property of the position that created it and is available for the exclusive use of that position. A Patent is secret – not published on the forums (one of the advantages of having a Concierge run the game), and the successful Patent serves as the Interpretation on the Regular Turn of its approval (only). An approved Patent may never be changed by any position or destroyed and is unaffected by other game events (except *Uber Alles*); very few technologies have ever been permanently lost in the troubled course of human history.<sup>4</sup>

- ✓ If you search Google for ‘lost technologies’ there are a few dozen (mostly clickbait) sites that list 10-15 technologies that have been lost. Most famous of the lost technologies is Greek Fire of the Byzantium Empire, others include Damascus Steel and the method for making Stradivari violins. There is also an article on Gizmodo and forum discussions on Quora. Some point out that lost technologies may not really be lost, but exist in different forms in modern times, or that modern technology has already far surpassed them. Thus, it is not impossible in GGDM for this to occur, but rarely.

Patents may be affected by later Patents (such as COT Patents), and may become effectively obsolete (see Eras). Patents may be *stolen* by Special Operations Black-ops (see specific discussion in Fuzzy Ops, 3 Special Operations, pp. 1306-1307, *infra*), and may also be shared with other positions under the proper conditions (e.g., through MegaCorporations, see 2 Commerce and 2 Corporations, generally, *infra*).

- ✓ Due to the nature of information (which Thomas Jefferson pointed out, *ut supra*), Patents are not lost when ‘stolen,’ but rather, ‘shared involuntarily.’ Don’t try to argue that in criminal court though.

If other positions reverse engineer or ‘inadvertently’ create similar Patents, their Patents are for their exclusive use, even if everyone has basically the same Patents. Even Existential Patents are

‘exclusive’ to their owners, and can be modified by COT or ET Patents so that the technology eventually differs from others.

- ✓ And of course, it is well known that the Soviet Union stole the atomic bomb information from Los Alamos (the Soviets had a whole spy network, there were about a dozen people involved); the Soviets exploded their first bomb in August 1949. How many billions did the Soviets save by stealing the design instead of doing it themselves? This issue is still being debated; the bomb was not stolen in one act, but was funneled to the Soviets in reams of technical information over several years. It took them years to build their own bomb when they had our information (partly, they lacked the material production infrastructure), avoiding the costly mistakes and dead-ends of our development process. What would have happened if the United States had retained sole possession of the atomic bomb for ten years before the Soviets matched? So much of the Cold War (e.g., bellicose behavior) is shaped by the fact that the Soviets got the bomb so easily and so soon.

*“Act as if the maxims of your action were to become through your will a universal law of nature.”*

– Immanuel Kant, First Formulation of the Categorical Imperative

**Patent Consistency:** As all positions are governed by the same physical laws of the universe,<sup>5</sup> what one position can do with a Patent can be done equally by another. Once a Patent is successfully prosecuted, the abilities granted by the Patent become a permanent part of the ‘laws’ of the game universe<sup>6</sup> (Sokal notwithstanding, see Alan Sokal feature quote, bottom of 3 Entropy, p. 249, *supra*) and are equally applicable to everyone who has a Patent granting those abilities, even if the Patent is secret. Another position could create a Patent to grant them the exact same, or very similar set of abilities by accident, observation or reverse engineering, though they may accomplish it in a different way.<sup>7</sup>

Creation in GGDM is like letting the genie out of the bottle – once loosed upon the game universe, that genie just won’t go home; I suspect that God – by whatever name – has the exact same problem: Humanity must be so annoying. See genie discussion relating to nuclear weapons, Little Willie Won’t Go Home, 1 Combat, p. 937, and the suitcase nuke discussion, 4 Combat, EN 14, p. 1002, *infra*. The Concierge will do his Kantian best to insure that the laws of the game universe remain constant, but entropy always wins in the end.

Whereas the physical laws of the universe are arguably the nearly perfect tyrant, in that they operate consistently, indifferently, every time, predictably, without fail, whether we understand them or not; but those same laws are not the ultimate tyrant, in that intelligent life finds ways to manipulate them, use them against each other, and ultimately circumvent them – we call it technology – the application of engineering to theory.

Other Interpretations have the same effect of becoming a ‘law’ of the *game universe*, but in less permanent ways, in less universal ways, in *different* ways, than the Patent. See official interpretations at the conclusion of Five Types of Facts discussion, 1 Dreamtime, p. 137, *supra*.

- ✓ Patents are strong Nomic elements. The Nomic is a game designed by Professor Peter Suber at Earlham College, Philosophy Department to demonstrate and explore the nature of “self-amending systems” and systemic logical hierarchies.

- ✓ Throughout GGDM, I point out that we are not placed here of our will, no one sought our consent (doing so is impossible) to be born. In other places, it is pointed out that things are created in GGDM by word, that the participants are universal legislators. GGDM has now reached the stage where participants are not only creating social interpretations, but creating the physical laws of the universe; you have reached the God-level where time and space do not matter (e.g., Robert Heinlein, *Job: A Comedy of Justice* (1984)). From there it follows that ‘populations’ in the game, the existence of the game universe, is not here by its own, or their own consent – you may think this is silly because they are not ‘real’ but that’s another discussion moving into *Tron* (1982) movie territory – which pretty much just recreates the situation in which we – and all things we consider ‘real’ – find ourselves. That is the very essence of the simulation. When you were a child you dreamed of being a race car driver? But what you got was a trike or a bike with training wheels (or maybe a Big Wheel!).

*“The received intellectual tradition has it that, in the sixteenth and seventeenth centuries, revolutionary philosophers began to curtail and reject the teleology of the medieval and scholastic Aristotelians, abandoning final causes in favor of a purely mechanistic model of the Universe.”*

– Ransom Johnson, Monte (2008), *Aristotle on Teleology*, pp. 23-24

**Patently Off-limits:** There should be no ‘final,’ ‘ultimate,’ or ‘unbeatable’ technology in the game. The Concierge and players should avoid viewing and treating game technology as a ‘tree’ or any sort of table, avoid the teleological view.<sup>8</sup>

- ✓ The game should also avoid ‘freebees’ (something from nothing) and retroactive effects of technologies in most cases; there must always be a cost, a limitation, and a counter (even if ‘non-technological’) or improvement to any technology in the game.

These are the ‘what not to do with Patents’ admonishments. It is offered in the same vein of the Keep the Sand in the Sandbox comments in 2 Dreamtime, p. 147, *supra*, to keep the game from veering into Monty Haul territory:

- ✓ “Mode: Monty Haul. Any campaign where the gamemaster doles out huge amounts of experience/treasure/power/other rewards. Usually becomes stupefyingly pointless after the player characters become the most wealthy/powerful beings in the universe.”  
– Jason Sartin, The RPG Cliché List.
- **Un-patentable:** *Teleos* is Greek for ‘final cause or end purpose’; the term teleology, coined in 1728 by Christian von Wolff, describes a process of defining things by their goal or purpose.
  - ✓ For example, suppose you ask a young child, “what is a fork?” And the child replies, “It’s for eating,” or “It’s for putting food in your mouth.” These are teleological answers, instead of describing a fork as an eating implement, usually made of metal or plastic, about 6” to 8” long, with a thin metal handle, prongs at one end...

Teleology is thus the opposite of technical description employed by scientists and philosophers. Even calling a fork an ‘eating implement’ is a bit teleological as it describes the *end purpose* of the fork. But on some level, description of the end purpose is necessary; if I provide a technical description of something, you will ask what it is used for, to put it in context.

- ✓ Discussion of teleology in language (and avoiding such usages) is an attack, frankly, on the basic cognitive habits *relating to or taught by religion*. It is thus not surprising that little progress has been made against teleological speech outside of professional scientific journals. Teleology is really the first line of battle.

Perhaps the ultimate attack on teleological thinking (and the patronage system of Europe) is Voltaire's description of Professor Pangloss:

Page | 751

- ✓ “‘It is demonstrable,’ said he, ‘that things cannot be otherwise than they are; for as all things have been created for some end, they must necessarily be created for the best end. Observe, for instance, the nose is formed for spectacles; therefore we wear spectacles. The legs are visibly designed for stockings; accordingly we wear stockings. Stones were made to be hewn and to construct castles; therefore my lord has a magnificent castle; for the greatest baron in the province ought to be the best lodged. Swine were intended to be eaten; therefore we eat pork all year round. And they who assert that everything is right, do not express themselves correctly; they should say that everything is best.’” – Voltaire, *Candide* (1759).
  - See discussion of Gottfried Leibniz' ‘best of all possible worlds’, PANGLOSS DOESN'T VISIT OFTEN, 1 Fallen to Earth, p. 1495, *infra*.

In terms of in-game technology, the teleological view would be that there is an ultimate form of every technology that all preceding technologies existed to lead to the ultimate, final technology. This is the video game technology tree that GGDM rejects.

- ✓ I have determined that the purpose for which Microsoft products, especially MS Word and the Edge browser in the last few months, were created is to annoy me. Observe for instance that both programs freeze, crash, and do inexplicable things; therefore I get annoyed daily when using them, and that must be for the best end.
- Predecessor Technologies: The Existential Patents, which represent the base technologies of interstellar culture and which must be completed before progression to the 2<sup>nd</sup> Era (see Event Horizon, 1 Eras, p. 760, *infra*), function effectively as predecessor technologies for the 2<sup>nd</sup> and 3<sup>rd</sup> Era. Most or many of the 2<sup>nd</sup> and 3<sup>rd</sup> Era Patents will be improvements upon or related to 1<sup>st</sup> Era Existential Patents. For example, the 1<sup>st</sup> Era Warship is an Existential Patent that will serve as the predecessor (even though one is *not strictly required*) for the 2<sup>nd</sup> Era Warship Patent, even if no 1<sup>st</sup> Era Warships are constructed (and the game becomes a big group hug event). But at the same time, a position could skip the 2<sup>nd</sup> Era Warship Patent and possibly develop a new Era Warship in the 3<sup>rd</sup> Era. The Concierge should certainly take into account ‘predecessor’ technologies as appropriate, but structurally, GGDM is (intended to be) non-teleological.
  - ✓ There is a technical argument for predecessor technologies used in the Stellar Conquest board game; e.g., copper metallurgy required somewhat advanced fire making ability and stone pottery, possibly charcoal production. Stellar Conquest also had ‘predecessor discounts’ – a mostly gamey gimmick to encourage players to follow one technology to the max (again, there might be some realistic argument, but mostly it was a design gimmick).
  - ✓ The Chinese never had the wine press, thus never invented the printing press, though I am sure they could have if there was a pressing social need and a tinkering genius.

These are the sorts of arguments offered supporting technology trees in games. However, *not all pre-requisites are strictly technological*; it is notable for example, that the reusable rocket and vertical landing were developed by commercial space operators, not by NASA, or the EU Space Commission, or the Chinese space agency, it was developed because business minds realized how expensive and wasteful (and non-competitive) were one-use rocket lifters. As of 2018, I believe that no other space-capable nation has developed either commercial space providers, vertical landing or reusable rockets (in fact, Russians were mocking their own space program online after the FalconX Heavy launch).

---

*“Teleology is like a mistress to a biologist: he cannot live without her but he’s unwilling to be seen with her in public.” – J. B. S. Haldane*

---

**Patent Defect:** Evolutionary biology is the area of study most plagued by and most aware of, the use of teleological language. Even when not intending to suggest teleology, the teleological concepts built into our language for millennia are nearly inescapable in evolutionary biology. As an anthropology student long ago, we were sternly warned to avoid and set aside teleological thinking as to the evolutionary process that led to humans; humans are not the ‘ultimate’ end or purpose, or even the inevitable result, of life and biological evolution on Earth, evolution didn’t happen to create us.

The most common form of teleological thinking is the unspoken assumption of people that the purpose of life on Earth, and of all of evolution, *was humans* who are at the same moment, regarded as the final purpose and product of evolution. This is really just the merger of evolution with preexisting creationism; or the substitution of scientific evolution for the creation myth.

- ✓ “Many people who say they believe in God no longer mean a person, or a trinity of persons, but only a vague tendency or power or purpose immanent in evolution.” – Bertrand Russell, “What is an Agnostic” (1953).

Humans need to continue to believe they are at the top of the heap, something special, without which, the Existential Void becomes so much more menacing (see Carl Sagan quote in *Empirical Mythology*, 1 Technology, p. 691, *supra*). Think about that.

- ✓ “We do not ask for what useful purpose the birds do sing, for song is their pleasure since they were created for singing. Similarly we ought not to ask why the human mind troubles to fathom the secrets of the heavens. The diversity of the phenomena of nature is so great and the treasures hidden in the heavens so rich, precisely in order that the human mind shall never be lacking in fresh nourishment.” – Johannes Kepler, as quoted by Carl Sagan in *Cosmos*, Episode 13.

In respect to Mr. Sagan’s scholarship, this is a good example of human-centric, teleological thinking, which is entirely consistent with the worldview (e.g., Voltaire’s *Candide* (1759)), cultural milieu of Mr. Kepler’s time and place in history. Though Mr. Sagan admirably avoids being teleological or overtly human-centric in his expressed views, he does echo throughout *Cosmos*, the idea expressed by Kepler of a wondrous universe that exists for humanity’s intellect, a view with which I take some issue in 2112 *Absurd Words*, *supra*.

- ✓ See also *Empirical Mythology*, 1 Technology, p. 691, *supra*.

*“Science, is stuff we understand about truths we only partially grasp. Religion is trying to get closer to truths we don’t understand.”*

– Guy Consolmagno, as reported by Dennis Overbye, *New York Times*,  
December 22, 2014

## Endnotes.

<sup>1</sup> Commentary: I wonder what Thomas Jefferson would think of Wikileaks? Having read this far in GGDM, you cannot dispossess yourself of it. You are trapped in the room with me. You have more, I do not have less.

<sup>2</sup> Commentary: Pharma-bro then cemented his already considerable reputation as a total jagoff by getting into a Twitter spat over their achievement.

<sup>3</sup> Commentary & Citation: This is an interesting issue that gets an occasional flyby in science-fiction adventure: Once the information is out there, and there is an environment of overlapping or open and widespread interstellar civilizations, what control exists on technology and knowledge? Even in situations where there is a homeworld and colonies in a singleton, it is likely that the homeworld may be (and must be able to) keep ahead of the colonies technologically (unless one of the colonies is in a position to discover a whole new technology).

- ✓ This plays into the discussion of Reverse Engineering, 3 Technology, p. 712, *supra*.
- ✓ Up to this point in human history – unless the ancient astronaut conspiracy theorists are correct – everything we have has been invented by humanity, all of our technology, scientific knowledge. Everything we know. What happens when not everything we know is about us, by us? Science-fiction authors play with this idea frequently, but rarely gets serious (e.g., Stargate SG-1 series) with the implications.

<sup>4</sup> Commentary: A lesson imparted on me by my mother at a very early age. I am not sure how or why it came about, but I recall my mother discussing with me in first or second grade, how ideas and inventions cannot be lost or destroyed, how, even when oppressed or suppressed, they surface again in other places and in later generations. In a modern example, LaserDisk was marketed in late 1978, two years after VHS VCR; VHS VCR eventually beat out LaserDisk and Betamax competitors and became the dominate video player for 15 or more years. LaserDisk however, developed into Compact Disk (CD) and reemerged in the 1980s, followed by DVD and Blu-Ray formats. VCR is now obsolete, of course; I had a DVR/VCR player, but now it’s junk, it wasn’t compatible with my new TV.

<sup>5</sup> Commentary: For example, the *Law of Ka-plunk*: The probability of the occurrence of an inevitable Ka-plunk Event (K) (the sound of a cat jumping into an empty cardboard box) is a function of the size of the empty box (B), the proximity of cats (C) and time elapsed since placing the empty box on the floor (T). This natural law is easily verifiable, repeatable, and most of all, predictable. It is believed that cats share some sort of quantum link with nearby empty boxes, but it has yet to be experimentally verified.☺

<sup>6</sup> Citation: **Q:** [analyzing the cause for the *Bre’el IV* moon’s trajectory] This is obviously the result of a large celestial object passing through at near right angles to the plane of the star system. Probably a black hole. **Lt. Cmdr. Data:** Can you recommend a way to counter the effect? **Q:** Simple. Change the gravitational constant of the universe. – Star Trek: The Next Generation, episode, “Déjà Q” (1990).

<sup>7</sup> Commentary: e.g., when I bought an Atari ST in 1989, it had a GUI interface and a mouse. IBMs were still using DOS Shell. The innovation did not win the market for Atari, yet all computers are now mouse-driven. Mozilla introduced tabbed browsing; IE didn’t have it for a year. Mozilla innovated, but has not won the market from MS.

<sup>8</sup> Commentary & Clarification: For the first 7 or 8 years of the design (the 1990s), I started with and expanded the existing Technology Tables from Stellar Conquest, adding new levels. They expanded and expanded until finally they imploded under their own weight, left the universe and resulted in the current technology rules. As a side note, the Colleges also started as three tables, but operated somewhat differently (via cumulative investment, instead of levels) than technologies, but again, grew and grew. I was always uncomfortable with determining what is the ‘final’ or ‘ultimate’ technology for each table; at some point (2001-2002), I made a conscious decision to abandon technology tables and trees, and all teleological thinking, opening the system up to whatever the players can dream of and work towards in the game. Colleges went somewhat the same direction, becoming open to whatever mission might be named. The Patent format is what insures that technology is sufficiently defined for operational purposes.

**Why Europe and the West? Why Not China?**  
*Journal of Economic Perspectives – Volume 20, Number 2 – Spring 2006*  
**David S. Landes**

The world history of technology is the story of a long, protracted inversion. As late as the end of the first millennium of our era, the civilizations of Asia were well ahead of Europe in wealth and knowledge. The Europe of what we call the Middle Ages (say, tenth century) had regressed from the power and pomp of Greece and Rome, had lost much of the science it had once possessed, had seen its economy retreat into generalized autarky. It traded little with other societies, for it had little surplus to sell, and insofar as it wanted goods from outside, it paid for them largely with human beings. Nothing testifies better to deep poverty than the export of slaves or the persistent exodus of job-hungry migrants.

Five hundred years later, the tables had turned. I like to summarize the change in one tell-tale event: the Portuguese penetration into the Indian Ocean led by Vasco da Gama in 1498. This was an extraordinary achievement. Some scholars will tell you that it was some kind of accident; that it could just as easily have been Muslim sailors, or Indian, or Chinese to make the connection from the other direction. Did not the Chinese send a series of large fleets sailing west as far as the east African coast in the early fifteenth century – bigger, better and earlier than anything the Portuguese had to show?

Don't you believe it. These affirmations of Asian priority are especially prominent and urgent nowadays because a new inversion is bringing Asia to the fore. A "multicultural" world history finds it hard to live with a eurocentric story of achievement and transformation. So a new would-be (politically correct) orthodoxy would have us believe that a sequence of contingent events (gains by Portugal and then others in the Indian Ocean, followed by conquests by Spain and then others in the New World) gave Europe what began as a small edge and was then worked up into centuries of dominion and exploitation. A gloss on this myth contends that a number of non-European societies were themselves on the edge of a technological and scientific breakthrough; that in effect, European tyranny (to paraphrase Thomas Gray's "Elegy Written in a Country Churchyard"), "froze the genial current of the [Asian] soul."

...I shall return later to this revisionist debate. Here, suffice to say: 1) The Portuguese success was the result of decades of rational exploration and extension of navigational possibilities in an ocean (the south Atlantic) that was hostile to traditional techniques of navigation, which essentially involved following the coastline. This technological enhancement rested in turn on a systematic utilization of astronomical observations and calculations, taken from the Muslims and transmitted largely by Jewish intermediaries, which allowed the Portuguese to follow winds and currents across the south Atlantic, and then use a knowledge of latitude to swing back around the tip of Africa and into the Indian Ocean. 2) The Chinese abandonment of westward exploration was partly the result of contingent political events; but at bottom it reflected the values and structures of Chinese society and civilization. 3) European exploitation of the breakthrough rested on a disparity of power technology (better powder and better guns) as well as on navigational superiority. The extension of European power into other parts of the world was the expression of these and other disparities. Why other regions did not keep up with Europe is an important historical question, for one learns almost as much from failure as from success.

### **The First Chance: Science without Development**

The one civilization that was in a position to match and even anticipate the European achievement was China. China had two chances: first, to generate a continuing, self-sustaining process of scientific and technological advance on the basis of its indigenous traditions and achievements; and second, to learn from European science and technology once the foreign “barbarians” entered the Chinese domain in the sixteenth century. China failed both times.

The first failure has elicited much scholarly inquiry and analysis. And yet it remains an abiding mystery. The China specialists tell us, for example, that in a number of areas of industrial technique, China long anticipated Europe: in textiles, where the Chinese had a power-driven spinning machine in the thirteenth century, some 500 years before the England of the Industrial Revolution knew water frames and mules; or in iron manufacture, where the Chinese early learned to use coal and probably coke (as against charcoal) in blast furnaces for smelting iron and were turning out perhaps as many as 125,000 tons of pig iron by the later eleventh century – a figure not achieved by Britain until 700 years later (Elvin, 1973, p. 85). In general, one can establish a long list of instances of Chinese priority: the wheelbarrow, the stirrup, the rigid horse collar (to prevent choking), the compass, paper, printing, gunpowder, porcelain. (But not the horse-shoe, which implies that the Chinese did not make use of the horse for transport.)

The mystery lies in the failure of China to realize the potential of some of the most important of these inventions. One generally assumes that knowledge and know-how are cumulative and that a superior technique, once known, will dominate older methods and remain in use. But Chinese industrial history offers a number of examples of technological regression and oblivion. The machine to spin hemp was never adapted to the manufacture of cotton; cotton spinning was never mechanized; and coal/coke smelting was allowed to fall into disuse, along with the iron industry. Why, asks Elvin (1973, pp. 297–298)?

It would seem that none of the conventional explanations tells us in convincing fashion why technical progress was absent in the Chinese economy during a period that was, on the whole, one of prosperity and expansion. Almost every element usually regarded by historians as a major contributory cause to the Industrial Revolution in north-western Europe was also present in China. There had even been a revolution in the relations between social classes, at least in the countryside; but this had had no important effect on the techniques of production. Only Galilean-Newtonian science was missing; but in the short run this was not important. Had the Chinese possessed, or developed, the seventeenth-century European mania for tinkering and improving, they could easily have made an efficient spinning machine out of the primitive model described by Wang Chen. A steam engine would have been more difficult; but it should not have posed insuperable difficulties to a people who had been building double-acting piston flame-throwers in the Sung dynasty. The crucial point is that nobody tried. In most fields, agriculture being the chief exception, Chinese technology stopped progressing well before the point at which a lack of scientific knowledge had become a serious obstacle.

*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*  
*See Appendix PUBS – Expansion of the Public Space Selected Summary*  
*See Appendix TECH – Technology Progress*

*“They will have time enough, in those endless aeons, to attempt all things, and to gather all knowledge ... no Gods imagined by our minds have ever possessed the powers they will command ... But for all that, they may envy us, basking in the bright afterglow of Creation; for we knew the Universe when it was young.” – Arthur C. Clarke, Profiles of the Future (1962)*

**Childhood’s End:** Suppose I decide – somewhat arbitrarily – that the ‘First Era’<sup>1</sup> of human technology ended in or about 1850 – the word “technology” came into our language in 1859 (Merriam-Webster online dictionary), did I mention that before? – and thereafter began the ‘Second Era’ which we are in currently. Under that division of human history, what would be the defining technology or development that sets the Second Era apart from the First Era that gives Second Era technologies that almost intangible extra dimension that makes First Era technologies not only obsolete, but quaint and clunky in hindsight?

- ✓ One must be careful in retroactively applying modern concepts. For example, we refer to prehistoric technology of which prehistoric people clearly had no collective concept. To them, it was something else, magic perhaps, perhaps a reason to make up an origin myth or to be thankful for the puddle that fit them just perfectly. Commonly, we are rather careless in retroactive application, other examples discussed in GGDM include modern concepts of evil, romance, empiricism, smiles, and feudal.

The defining event of the Second Era would be the understanding of electricity, and the development of technologies to utilize, generate, and transmit electricity. Napoleon used telegrams on the eve of the change from the First Era to the Second Era. The most famous inventions of the late 19<sup>th</sup> Century were almost all based on the use of controlled electrical current – a technology based on ‘controlled lightening’ harnessed by human ingenuity, and by the 1950s the world moved from electrical engineering to electronics – the pioneers of the modern computer were electrical engineers pushing the edge of electric technology.

Now, were I to speculate on what development might be the defining element moving us into a ‘Third Era,’ I wouldn’t have much of a clue, but like so many before me, I would speculate that it would probably have to do with the invention of a new space propulsion system (and the principles that would be involved would revolutionize other technology areas) or intelligent machines. Others might speculate that it would be the development of a Unified Field Theory that revolutionizes the world’s technology, still others might look to the quantum (e.g., quantum computing, quantum communication) for the next era emergence.

- ✓ On the exponential progress of technology, perhaps an analogy: we can only see the shadow of a hypercube in three dimensions, a hypercube exists in a direction we cannot point to. It is thus that I know what the difference in Eras should look like, but can’t predict the new direction that technology has taken from the 1<sup>st</sup> Era to the 2<sup>nd</sup>.

Now, in the game, the invention of the Stardrive,<sup>2</sup> is the technology that (arbitrarily) defines cultures in the game as moving into the 1<sup>st</sup> Era of interstellar technology. Continuing on, I don’t know, and wouldn’t speculate, in game terms, what defining development would usher the interstellar civilizations into the 2<sup>nd</sup> Era, or what 2<sup>nd</sup> Era technology would look like, but based on the previous observations of recent Earth technology, I know what the effect/difference should look

like. That effect/difference, what I call here the Uber Alles, can be simulated abstractly – without needing to define the technological details.

- ✓ The Stargate SG-1 episode, “2010” shares some vague conceptual similarities to Arthur C. Clarke’s novel, Childhood’s End, except that the Aschen Confederation conquers by benevolently helping races to extinction with their advanced medicines while lulling them into complacency with peace and prosperity. The Aschen are like the bratty kid who helps grandmother down the steps with a kick from behind. Rumor is that there are a few of those in the Galactic Space. Don’t be grandma! See ‘total extinction’ in Countdown to Extinction, 1 Resolution, p. 1462, *infra*. The main characters mount an assault on the Aschen-controlled Gate to send a note back in time in hopes of avoiding the Aschen future. It’s a clever episode, but it probably didn’t work: Locking out the Aschen gate address in 2001 likely just created a branch non-Aschen timeline, while the Aschen timeline to human extinction continues.
- Scaling Eras: The 1<sup>st</sup> Era of Technology in GGDM necessarily corresponds to Type 1 Civilization on the Kardashev Scale (this was not intentional design).<sup>3</sup> Whether the 2<sup>nd</sup> Era corresponds to Type 2 and the 3<sup>rd</sup> Era corresponds to Type 3 civilization depends on the imaginations of the participants and the type of game being played. But it is not likely.
  - ✓ On the John Barrow Microdimensional Mastery Scale, the 1<sup>st</sup> Era corresponds roughly to Type IV Minus technology, with the possibility that the 2<sup>nd</sup> and 3<sup>rd</sup> Eras might reach from Type V Minus to Type Omega Minus capabilities.
  - ✓ Finally, in the Robert Zubrin Scale of Civilizational Range, most positions begin at Type I and it is expected that for the time of the game, most will progress to and remain at Type II Civilizational Range.

The three scales are not necessarily incompatible or exclusive of one another in any way, and taken together represent a conceptual map for interstellar civilization.

- ✓ “As an example, consider the human civilizations of Avatar and Ender’s Game. Both use relativistic craft and travel between fairly local systems. Though there are world-destroying weapons and much larger-scale space travel in Ender’s Game and its sequels, the phlebotinum involved is specifically said to use enormously less energy than normal physics would suggest for accomplishing those tasks. In Avatar, the necessity of brute-forcing relativistic travel speeds may put that civilization higher on the Kardashev scale, despite the largely inferior technology and scale of development. Keep this in mind when placing examples, and try to include some explanation. After all, a hallmark of improving technology is increased efficiency, which would actually lower a civilization’s Kardashev rating, all else equal.” – from TV Tropes.com, “Abusing the Kardashev Scale.”

Thus, greater power consumption does not correspond directly to greater technology; the breakthrough technology was transistors and then Very Large Scale Integration (VLSI, i.e. the computer chip) which use less energy.

An interesting concept and one I have not seen elsewhere in this form (and is probably more to the point), and so I guess I am proposing here, is that the true measure of a civilization’s ‘progress’ is its mastery of abiogenesis, psychogenesis, and noogenesis, and maybe cosmogenesis (see Order of Genesis discussion, 1 Order, p. 522, *supra*). Those four, which I will

call the Gee-scale (in the vein of the preceding scaled measures of civilizations) holistically represent a true measure of ‘levels’ of civilization and shelf levels of existence. Science-fiction literature, of course, is filled with examples of the ability to bring life to inanimate matter (abiogenesis) and self-conscious intelligence/sapience to entire races (‘uplift’) or to machines (AI), all of which are usually presented as the godlike achievements of ancient star-faring races or the accidental, tragic bumbblings of man. But it is usually expressed in other frameworks, and not as a ‘genesis’ scale.

---

*“Second, I hope very strongly that one of the by-products of IGY may be this: that it drive the last nail in the coffin of the juvenile, and dangerous argument over the value of basic research. Scientific advances, whether national or international, can no longer be sustained on a crash basis or by gifted tinkerers. They depend almost exclusively upon the rewards of basic research. The mere symbols of basic research have become fantastically powerful in recent years.”*

\*\*\*

*“The IGY has had a double impact upon society, first as a purely scientific enterprise, and this I have already briefly discussed. That IGY also has overriding significance as a purely human engagement, as an activity of man without specific reference to its subject matter. ...*

*First, it was not a government program, although governments at home and abroad supported it generously. Second, it was not a military program, although the military establishments of many governments, like our own, provided a variety of logistic support. Third, it was not an internationalized program, even though one of its greatest achievements was in the field of international cooperation. The very fact that it was none of these things accounts for a large measure of its success, scientific and international.*

*What it was and what it is, is this: a gathering together of private human beings, each of whom had a vital personal interest in a particular subject, each of whom felt that this subject needed, out of its own exigencies, a concerted attack, but one for which a simple, uncluttered mechanism would suffice.*

*Thus the IGY was at root an enterprise of private persons, an enterprise in the hands of doers, and the form and shape it took largely reflect this. This form and this shape reveal much about the character of the IGY and may well afford a pattern worth noting, worth using again in other areas.”*

– “The Meaning of the International Geophysical Year,” Remarks by Dr. Hugh Odish, Executive Director, US National Committee for IGY, before the National Press Club, Dec. 4, 1958

---

**The Matrix:** The Era Matrix is a separate two-dimensional grid to which Research Groups are moved when they become Applications. It is not part of the Public Space, and is not affected by events in the Public Space. The Matrix contains only connectors and Applications, and each position has its own Era Matrix which (like the Public Space) is hidden from the view of others.

There is inherent in the Application the assumption that at the moment it is placed on the Era Matrix, the new technology represented by the Application is demonstratively superior to the currently existing technology of the same general type. This is an important concept for Patents and technological progress in GGDM.

- First Era Matrix: Matrix' represent objective physical laws. Each Era has a different Matrix, however, all positions have the same Matrix for each Era, such that, unlike Public Space, they are not unique to the position. The 1<sup>st</sup> Era Matrix is a *four by four square* where Applications are placed one each in the squares of the grid. Thus, the 1<sup>st</sup> Era Matrix has room for sixteen Applications and connections may be made vertically, horizontally, and diagonally.
- #IGY: One is added to each dimension of the Matrix for each Era following the first. That is, the 1<sup>st</sup> Era Matrix is 4x4 and has spaces for 16 Applications, the 2<sup>nd</sup> Era Matrix is 5x5 and the 3<sup>rd</sup> Era Matrix is 6x6 with space for 36 Applications.
- Current Era Matrix: Whenever the rules refer to the 'current Era Matrix' the term means whatever Matrix they are currently using. When a position passes to the next Era, the Matrix from the previous Era remains and is available, however, there is little reason for positions that have passed to the next Era to continue to use the previous Era Matrix to develop technologies; it is kept mostly for reference. Applications **are not** transferred to the next Era when a position advances, rather, in each Era, each position must start over again (*tabula rasa*) developing Applications and prosecuting Patents for that Era.
- Fourth Era and Beyond: The game design is premised on three technology Eras, however, it is possible, theoretically, for positions to move beyond the 3<sup>rd</sup> Era into the 4<sup>th</sup> Era (however, see Terminus, 1 Temporal Technology, p. 801, *infra*); it is possible for the game to have an infinite number of Eras, with each Matrix increasing in size. However, this game is premised on a balanced development of technology, culture, industry, military machines, and exploration and expansion, such that it is not anticipated that most positions will pass beyond the 3<sup>rd</sup> Era before the game ends. See It was the End of History, 1 Resolution, p. 1456, *infra*.

*“Laws of thought, traditionally, the three fundamental laws of logic: (1) the law of contradiction, (2) the law of excluded middle (or third), and (3) the principle of identity. That is, (1) for all propositions p, it is impossible for both p and not p to be true ... (2) either p or ~p [not p] must be true, there being no third or middle true proposition between them ... ; and (3) if a propositional function F is true of an individual variable x, then F is indeed true of x.... Another formulation of the principle of identity asserts that a thing is identical with itself ... or simply that x is x. Aristotle cited the laws of contradiction and of excluded middle as examples of axioms. He partly exempted future contingents, or statements about unsure future events, from the law of excluded middle, holding that it is not (now) either true or false that there will be a naval battle tomorrow but that the complex proposition that either there will be a naval battle tomorrow or that there will not is (now) true...*

*That the laws of thought are a sufficient foundation for the whole of logic, or that all other principles of logic are mere elaborations of them, was a doctrine common among traditional logicians....*

*In 1920 Jan Lukasiewicz, a leading member of the Polish school of logic, formulated a propositional calculus that had a third truth-value, neither truth nor falsity, for Aristotle's future contingents, a calculus in which the laws of contradiction and of excluded middle both failed. Other systems have gone beyond three-valued to many-valued logics – e.g., certain probability logics having various degrees of truth-value between truth and falsity.”*

– Encyclopedia Britannica article, “Laws of Thought,” retrieved April 20, 2018

**The Laws of Human Thought:** I played a game of Mahjongg this evening. The game lasted 4 minutes and 22 seconds, the game also lasted nearly an hour. Both statements are true and most would not have difficulty accepting them in the proper framework (i.e. I paused the game to go put dinner in the oven and ended up doing several other tasks before returning), but a really simple machine intelligence might not resolve the contradiction. The program, “60 Minutes” can be said (truthfully) to have run 2,325 hours (i.e. episodes) as of December 3, 2017, over 51 years. On American television, an NFL game lasts 60 minutes and also 3½ (or more) hours. The last 5 minutes game time of any broadcast sporting event lasts 30 to 45 minutes. Girlfriends get mad when you say there is only 5 minutes left in the game, I want to finish watching this – and it finally ends 45-minutes later. This is true of nearly every sporting event broadcast. The ability to understand these truths is the same as a double entendre:

- ✓ “I shot an elephant in my pajamas this morning. How he got in my pajamas, I don’t know!” – Groucho Marx.

According to the 2011 IBM TV commercial that aired this video sound byte, computers could not understand this double entendre. In 50 years, this will probably be a historical moment.

- ✓ **Guin:** I’ll see you in 500 years, Picard. **Picard:** And I’ll see you in a few minutes. – Star Trek: TNG, “Time’s Arrow, Part 2” (1992).

The ending of Carl Sagan’s *Contact* (1997) takes advantage of this; the sphere dropped through the spinning rings and into the safety net in seconds, but the internal time passed was 18 hours. Although the politicians covered themselves with a Congressional investigation into an apparent boondoggle (citing Occam’s Razor), both time measurements were objectively true. Non-scientific humanity simply didn’t have (or want to have) the proper framework.

- ✓ Within GGDM there warships and not warships (e.g. Colony Ships, Cargo Ships, Scouts, Log Ships), something is either a warship or not a warship and both cannot be true at the same time.
- ✓ A Log Ship is not a warship, but is allowed to move as a warship because it is necessary for the game (see Warships, 1 Combat, p. 941, *infra*).
- ✓ Within GGDM, there are starships and fighters, the line between the two is bright and clear at the start (but may become less so later in the game), one is a unit, and the other a unit enhancement, and as such, there is no middle or third option (see Fighters, 1 Carriers & Fighters, p. 1046, *infra*).
- ✓ But a system boat is not a starship, and not a fighter, but can frequently act as a ship but cannot move between stars on its own (see System Boats, 3 Construction, p. 677, *supra*), could carry fighters, but can never act as a fighter in any sense.
- ✓ Fighters, however, can never act as a ship except that they can initiate combat as if they were a warship if based on another unit, a colony for example.
- ✓ “It’s all terribly confusing.” – Ancient One, The BeastMaster TV series.

Now, I could have attributed the previous quote properly to “The Ancient One,” the character’s official name, but since there is only one Ancient One in the series (and presumably that world), an appearance of the character is either  $p$  or  $\sim p$ , and thus, if the Ancient One’s appearance is  $p$ , then we don’t need to include ‘the’ article to distinguish from others and it is usually ignored.

- ✓ In the real world, I read an article, I think it was in 2019, ridiculing Ohio State University for engaging trademark lawyers to register “The Ohio State University”; viewers of NFL football have seen alumni players introducing it in that way on national television, with an emphasis on the “THE.” It also appears that way on the university website. Pundits ridiculed the egotistical waste of money as no one would confuse Ohio State University in Columbus, Ohio, with the much smaller Ohio University in Athens, Ohio. Nor is there another state university in Ohio or anything close.
- Progress: The word ‘progress’ is fraught with controversy, as indicated perhaps by the fact that there are political parties and movements in most nations who call themselves ‘progressives’ and are opposed by those who don’t call themselves ‘anti-progressives,’ but prefer the warm fuzzy term ‘conservative’ (or ‘ultra-nationalist’ nowadays, wherever progressive thought is associated with urban globalism and multi-culturalism) instead. Progress in this sense was previously discussed in *The Bargain*, 5 Culture, p. 426, *supra*. And as discussed in *Patently Off-Limits*, 3 Patents, pp. 750-752, *supra*, there are philosophical and scientific issues where ‘progress’ is linked to teleological thinking. But when I say that I am progressing down the page, no controversy exists as to what is meant and whether this is good or not.
  - ✓ After all that said, ‘progress’ of Eras is intended here in the simplest sense, as defined by Merriam-Webster online dictionary at *progress* (n): **3**: gradual betterment; especially: the progressive development of humankind, and *progress* (v): **2**: to develop to a higher, better, or more advanced stage.

---

*“You never change things by fighting the existing reality. To change something, build a new model that makes the existing model obsolete.”*

– Buckminster Fuller

---

**The Blurry Lines of Progress**: There is no bright line or singular event that defines 1850 as the year that humans on Earth passed from one technological era to another, nothing special at all about 1850. Lines and retroactive terms are things imposed in historical hindsight (e.g., terms such as ‘feudal’ or ‘the Middle Ages’), whereas, the actual course of progress is like a drunken person staggering forward in a blur.<sup>4</sup>

- ✓ “Historians cheat.” – Dr. Paul T. Mason, Jr., Duquesne University, Dept. of History.
- The Progress of Eras: An Era is complete when:
  - 1) All Applications spaces on the Era Matrix are filled, and
  - 2) All Applications are connected to at least one adjacent Application.

When this occurs, the position automatically progresses to the next Era (however, see next section regarding the 1<sup>st</sup> Era) and the next Era Matrix becomes available, a new Current Era.

Conceptually, the completion and connection of all of the Applications in the Era, collectively advances technology by an order of magnitude; the advancement of technology or technological progress is not accomplished usually by a single incredible invention, but rather by the accumulation of small inventions and application to engineering problems. For example, compare the cell phone to the rotary phone to the telegram.

- ✓ Remember that Development of the final Application of an Era is automatically successful. See Short One Wingnut, 2 Technology, p. 708, *supra*. Connectors however, are not automatic, they are part of the Patent process (see Patent Prosecution, 3 Patents, p. 747, *supra*).
- Event Horizon: There are two additional requirements that must be met to exit the 1<sup>st</sup> Era:
  - ✓ First, in order to progress to the 2<sup>nd</sup> Era, the position must have obtained a Stardrive Patent. This is not negotiable, a 2<sup>nd</sup> Era position cannot exist without Stardrive.
  - ✓ Second, before exiting the 1<sup>st</sup> Era, a position must have obtained or successfully prosecuted *all* of the Existential Patents (if possible, see below).

The Generic Stardrive Existential Patent *satisfies both requirements*, as it is also an Existential Patent. The 1<sup>st</sup> Era may be quite long for some positions, most positions will spend the majority of the 1<sup>st</sup> Era developing technological basis for interstellar culture: The Stardrive and the Existential Patents, with one or two new unique technologies. Further:

- ✓ A 1<sup>st</sup> Era position may only prosecute Existential Patents until it has successfully prosecuted (and/or ‘bought’ during the setup) 11 Existential Patents, excluding GSD.
- ✓ See further, And One Moving Violation, 1 Stardrive, p. 789, *infra*.

There are a mind-boggling number of possible combinations to fill the 1<sup>st</sup> Era Matrix; it is probably possible to do so without completing all of the 1<sup>st</sup> Era Existential Patents. When this happens, automatic progression should be delayed two (rounded up) Regular Turns for each un-obtained Existential Patent, thus providing an incentive to keep the 1<sup>st</sup> Era tidy.

- All Things Are in Motion: Upon advancing to the next Era, a roll is made for each Patent completed in the Era to see if a new Monad is added to the position’s Public Space. There is a 10% chance x the level of the new Era for each Patent to result in an added Monad, e.g., there are 17 Existential Patents in the 1<sup>st</sup> Era, each of which has a 20% chance to add a Monad to the position’s Public Space (average result would be 3-4 added Monads). The new Monads are randomly inserted into the Public Space. As described in Over the Edge, 1 The Sidereal Stage, p. 108 and Edge of Reality, 4 Writs, p. 452, *supra*, inserting Monads in the Public Space can push existing pieces out of adjacency and just generally mess things up.
  - ✓ “But today we find modern science almost repeating Heraclitus’ dictum when it says: ‘*All things are in motion.*’ Like all dicta which briefly resume wide truths, this dictum of modern science requires expanding and explaining if it is not to be misinterpreted. By the words, ‘All things are in motion’ we are to understand that, step by step, science has found it possible to describe our experience of perceptual changes by types of relative motion: This motion being that of the ideal points, the ideal rigid bodies, or the ideal strainable media which stand for us as the signs or symbols of the real world of sense-impressions. We interpret, describe, and resume the sequences of this real world of sense-impressions by discussing the relative positions, velocities, accelerations, rotations, spins and strains of an ideal geometrical world which stands for us as a conceptual representation of the perceptual world. In our Chapter V. we saw that space and time did not themselves correspond to actual perceptions, but were *modes* under which we perceived, and by which we discriminated, groups of sense-impressions” – Karl Pearson, The Grammar of Science (1892), p. 239 (found on Google Books, also on archive.org)(emphasis in original).

*“Part 1: Beyond the Zero’ contains 21 episodes. The name ‘Beyond the Zero’ refers to lack of total extinction of a conditioned stimulus. The events of this part occur primarily during the Christmas Advent season of 1944 from December 18–26. The epigraph is a quotation from a pamphlet written by the rocket scientist Wernher von Braun and first published in 1962: ‘Nature does not know extinction; all it knows is transformation. Everything science has taught me, and continues to teach me, strengthens my belief in the continuity of our spiritual existence after death.’ The epigraph reflects themes of anticipated redemption and blurring of the sacred and secular, both of which pervade Part 1.”*

– from Wikipedia article, “Gravity’s Rainbow” (“a 1973 novel by American writer Thomas Pynchon”), captured September 5, 2019 <sup>5</sup>

**Beyond the Zero:** Nothing could be more telling on so many levels than the defeat of the Mahdist at the Battle of Omdurman in 1898 and the Battle of Umm Diwaykarat in 1899. Those who were paying attention might have been the prophets of World War I combat: Industrialized technological warfare had finally overwhelmed religious fanaticism (promise of afterlife reward), tribal savagery and human wave attacks that had characterized human warfare for more than ten millennia. Methodical technological tactics overtook fearsomeness and impact of numbers.

The jihadist state, as a political, religious and economic power model failed miserably in less than a generation; while England, led by Prime Minister Gladstone (whose opposition to the Opium Wars as an MP fueled his political rise; his sister suffered heroin addiction), began to have doubts and back away from imperialist colonial adventure and European colonialism subsequently crumbled in the next three generations. The results of Omdurman and Umm Diwaykarat perhaps foreshadowed a similar, broader process of the 20<sup>th</sup> Century – that had begun two centuries before – where technology and industrialization completely overwhelmed and changed the institutions of the Western world and more slowly, the institutions of humanity globally.<sup>6</sup>

*“Luckily for quantum physicists, you don’t always need to explain a phenomenon in order to use it. Ancient humans didn’t know about friction before inventing the wheel; doctors in medieval China didn’t know about antibodies when they began inoculating people against smallpox 600 years ago. Not knowing what’s behind quantum entanglement didn’t stop Jian-Wei Pan, a physicist at the University of Science and Technology of China in Shanghai, from rocketing it into space.”*

– Sarah Kaplan, “Quantum entanglement, science’s spookiest phenomena, achieved in space,” The Washington Post, June 15, 2017

**Advanced Technology:** There is no difference in the Research process in any Era, as Research occurs in the Public Space. Research and Research Groups are the same throughout the game, for everyone in all Eras.

- ✓ “Any sufficiently advanced technology is indistinguishable from a completely *ad-hoc* plot device” – David Langford, “A Gadget Too Far,” (New Worlds 2, 1992, anthology) as a corollary to Arthur C. Clarke’s Third Law.

- Advanced Development: Positions may attempt to Develop Applications on the next Era before completing the current Era. Positions *may not* attempt to develop Applications two or more Eras ahead of their current Era Matrix. The next Era Matrix becomes available for Patents as soon as a position successfully Develops the first Application in that Era.

If a position intends to attempt to Develop an Application in the next Era, that must be indicated in the Actions sent to the Concierge, otherwise, it will be assumed that the Application is being Developed in the current Era Matrix. The cost of Developing an Application in the next Era is tripled and the base chance of Development of the Application is reduced by the percentage (fractions are truncated) of uncompleted Applications in the current Era.

- ✓ For example, the normal base chance of Developing a Research Group into an Application is 50% (see Short One Wingnut, 2 Technology, p. 708, *supra*). When attempting Advanced Development into the next Era, the base chance is 50% minus the percentage of uncompleted Applications in the current Era. Thus, if attempting Advanced Development into the 2<sup>nd</sup> Era, the position would need to have completed more than 8 of the 16 Applications on the 1<sup>st</sup> Era Matrix and would pay triple RPs.

Additionally, for the first Application Developed in the next Era, there would be a negative adjustment (see Short One Wingnut, 2 Technology, p. 708, *supra*) for the first Application in a new Era. Thus, practically, a position may not attempt to Develop Applications in the next Era before most of the current Era Matrix has been filled.

- ✓ Continuing the previous example, there is a 10% penalty to the normal chance of Development for the first Application in a new Era (see Short One Wingnut, 2 Technology, p. 708, *supra*). Thus, a 1<sup>st</sup> Era position would need to Develop 10 Applications on the 1<sup>st</sup> Era Matrix before attempting Advanced Development of the first Application on the 2<sup>nd</sup> Era Matrix (50% base chance minus 10% for first Application minus 37% uncompleted Applications on the 1<sup>st</sup> Era Matrix = 3% chance of Advance Development of the first Application on the 2<sup>nd</sup> Era Matrix). Once the first Application in a new Era is successful, future Applications can take advantage of adjacency bonuses.

Conversely, if a position has filled the current Era and is merely waiting (and a bit unlucky) for the last connections to be made between Applications to trigger the automatic progression, then there is minimum adverse effect on Development in the next Era, except the cost.

- ✓ Advanced Development should not be confused with or considered as advancing to the next Era, which cannot occur until the current Era Matrix is completed and all requirements are met.
  - ✓ Advanced Development may be an option if a Research Group has failed Development in all remaining Applications in the current Era and is foreclosed from the current Era. See The Kitty Incident, 2 Technology, p. 708, *supra*.
- Folding Space: It is possible for a position to attempt to avoid the specific requirements for automatic progression from the 1<sup>st</sup> Era to the 2<sup>nd</sup> Era using the Advanced Development and Advanced Patents rules presented below (i.e. never completing the last Application on the 1<sup>st</sup> Era Matrix). Doing so makes a hard and expensive hill to climb and may ultimately retard technological progress later in the game. Additionally, the Concierge may rule (but is not required to) that a position may not automatically progress to the 3<sup>rd</sup> Era when eligible, until

the 1<sup>st</sup> Era is completed (i.e. the last Application on the 1<sup>st</sup> Era Matrix is completed after the position has nearly filled the 2<sup>nd</sup> Era Matrix with Advanced Developments).

- ✓ The Advanced Development and Advance Patent rules simulate the blurry part of the line of technological gain, they create a situation that snubs both the Law of Contradiction and the Law of Excluded Third (*ut supra*).
- Advanced Patents: Positions may attempt to prosecute **non-Stardrive** Patents in the next Era as soon as the position has enough Applications in the next Era to try a Patent (i.e., a minimum of two Applications). Because Patents operate on the connection of all Applications listed on the Patent, a Patent *may not contain Applications from different Eras*; that is, all Applications used in a Patent must be found on the same Era Matrix. It is possible, if difficult, to create COT and ET Patents in the next Era based on a PIT Patent in the current Era.

The cost of prosecuting a Patent in the next Era will be 5+1-10 RPs per attempt (based on a die roll on a ten sided die) and the base chance (50%) of connecting any two Applications is reduced by 10 minus the number of successful Patents in the *current* Era x 5%. Thus, if a position has 5 successful Patents (of any type) in the current Era, the chance of making connections for Advanced Patents is 25%, whereas if the position had 10 successful Patents in the *current* Era, there would be no adjustment to the base chance of making connections.

- ✓ Stardrive Patents are a separate, special type of Patent and are not available as Advanced Patents. See And One Moving Violation, 1 Stardrive, p. 789, *infra*.
- ✓ The RP cost of prosecuting a Patent (above) *only applies to* Advanced Patent attempts. There is no RP cost for normal Patent prosecution attempts in the current Era. See Physical Item Technologies, 2 Patents, p. 739, and Back to the Drawing Board, 3 Patents, p. 748, *supra*.
- ✓ While the number of successful Patents is being used as a criteria for Advanced Patents, there is no rule specifying any number of Patents required to advance to the next Era, except that a position must successfully prosecute one Stardrive Patent and all Existential Patents to advance to the 2<sup>nd</sup> Era Matrix, *ut supra*.
- Future Shock: The Concierge may impose additional, temporary costs and restrictions and other difficulties or instabilities on advanced Patents that will be lifted once the position properly progresses to the next Era. The Concierge may also make case-specific rulings on any other sort of cross-Era situations, such as applying 2<sup>nd</sup> Enhancement Technology Patents to 1<sup>st</sup> Era ships.
  - ✓ A classic example is insufficient energy to power an advanced weapon on an inferior ship, for example, the advanced Excalibur Class destroyer in Babylon 5 whose main weapon, when fired, left the ship immobile and vulnerable for a minute (except life support and communications) while the power recharged the systems. The limitation manufactured drama for the program.

The Concierge will take into account in all cases, the level of industrialization of the position, the technology base of the position, the percentage of completion of the current Era Matrix, and social factors and institutions.

- ✓ Advanced Development or Patent Prosecution **does not entitle** the position to any abilities granted by the Uber Alles for the next Era, see 2 Eras, p. 767, *infra*, or any other advantages of the next Era (e.g., see Player Piano, 2 Eras, p. 770, *infra*).

*“In an essay for the journal American Anthropologist, Brown University linguistics professor Philip Lieberman described as ‘absurd’ the mixture of different levels of advancement among different tribes living in close proximity. Lieberman pointed out that it ‘would be most unlikely 80,000 years ago’ for humans to still be exhibiting ape-like characteristics, at the same time noting that the Ivaka tribe was depicted as having ‘a village culture that would have been likely 10,000 years ago.’”*

– from Wikipedia article, “The Quest for Fire (film),” captured June 10, 2019 (citing to Lieberman, Philip (December 1982). “Film Reviews: Quest for Fire.” American Anthropologist. 84 (4): 991–992)

**Bruit Suit:** There is an interesting distinction: While Prof. Lieberman’s point is probably true – and I say this with reservations because of the historical difference between the Europeans and the rest of the world in the 15<sup>th</sup> Century and Jared Diamond’s arguments – of cultures co-existing on the same planetary surfaces, it has not been true in science fiction (and *probably* will not be true in reality *if* we ever discover other intelligent technological civilizations) due to both the unbelievably vast interstellar distances, separate development of sapience and cultures on many planets, and because science fiction is generally based on Western history, particularly the period of European hegemony. Thus, ‘bruit,’ (pronounced ‘brute’ not ‘bru-it’) in all of its meanings, is a rather fitting (archaic) term for GGDM play:

- ✓ “Back in the days of Middle English, the Anglo-French noun bruit, meaning ‘clamor’ or ‘noise,’ rattled into English. Soon English speakers were also using it to mean ‘report’ or ‘rumor’ (it applied especially to favorable reports). We also began using ‘bruit’ as a verb the way we used (and still occasionally do use) the verb ‘noise,’ with the meaning ‘to spread by rumor or report’ (as in ‘the scandal was quickly noised about’). The English noun ‘bruit’ is now considered archaic, but the verb lives on.” – from Merriam-Webster online dictionary at *bruit*.

Within the Galactic Space co-exist (peacefully or not) races with different levels of technology, suspiciously watching each other or casting loving gazes, spreading or collecting rumors, and making a lot of noise in the vacuum of space.

*“One of the biggest roles of science fiction is to prepare people to accept the future without pain and to encourage a flexibility of mind. Politicians should read science fiction, not westerns and detective stories. Two-thirds of 2001 is realistic – hardware and technology – to establish background for the metaphysical, philosophical, and religious meanings later.” – Arthur C. Clark <sup>7</sup>*

**Kindergarten Experience:** I once saw a news program about a business that offered a ‘kindergarten experience’ to groups of adults who paid to be – literally – treated like kindergarteners for a day. How can anyone conduct or attend such a farce with a straight face – I can only picture Allison Pill from Snowpiercer (2014) – without a noxious feeling inside?

Many people are nostalgic for their childhood, wishing they were children again to escape responsibility, pressures, and meaninglessness of adulthood. To be a child is to be powerless, completely dependent on adults, lacking in judgment, knowledge, understanding, gullible, vulnerable; “hell is for children!” as Pat Benatar sang (and screamed) in 1980.<sup>8</sup> Who wants that

again? But as the West discovered in the early 20<sup>th</sup> Century, adulthood is the illusion that you are not powerless, dependent, or lacking in judgment, knowledge or understanding, thus we have constructed expensive social safety nets.

- ✓ This is also the problem with so-called ‘girlfriend experience’ services (which is just a repackaging of professional mistress and other similar services) – how can one engage in an intimate relationship they know is paid (contrast this with say, visiting a psychiatrist)? The feeling of illegal drugs is not real either, but the physical addiction is too powerful for users to disengage. The problem of human looking is that we cannot un-look. And this was the psychologically devastating ending of Robert Sheckley’s 1957 short story, “Pilgrimage to Earth” – in his naivety and need, the off-worlder was willing to think real the romantic love from a perfect girl who was programmed to please him (programmable girl is a concept reused in Dollhouse series).
- ✓ I worked with a young lady several years ago and would from time to time in walking through the office, overhear her talking to her boyfriend on the phone. The way she spoke to him like a juvenile, maybe being too cutesy or manipulative, almost made me ill and I had a sense that relationship would be over as soon as he finished remodeling her kitchen. I wasn’t wrong, it didn’t take long.

---

*“Mighty and Everlasting Bomb, who came down among us to make Heaven under Earth, lighten our darkness. O instrument of God, grant us thy peace.”*

*“Glory be to the Bomb, and to the Holy Fallout. As it was in the beginning, is now, and ever shall be. World without end. Amen.”*

*“May the Blessings of the Bomb Almighty, and the Fellowship of the Holy Fallout, descend upon us all. This day and forever more.”*

– Leader Mendez, *Beneath the Planet of the Apes* (1970) <sup>9</sup>

---

## Endnotes.

<sup>1</sup> Commentary: It is an East Asian tradition to define their history in periods or eras, or by the names of rulers, we do something similar, e.g., “Nixon era” or “Vietnam era.” That is not the basis of or inspiration for the eras scheme for GGDM technology progression. Instead, “Eras” were a reimagining of the ‘levels’ of the technology tables in the Stellar Conquest board game, a nominally non-teleological scheme to solve the technology tables problem.

<sup>2</sup> Commentary: What is most interesting about the reimagined Battlestar Galactica series is that the only technology that they have that we don’t have is their FTL drive. The Cylons have the same technology and have additionally evolved a biological-machine technology. Other than the FTL – and the fact that the Galactica can take nuclear missile hits and survive, the modern viewer easily recognizes everything else in the show; humans, technology and culture, except that they are polytheistic. The technologies we recognize, like their life support systems and space structures, are perhaps just a lot better than what we have, but not so much so as to impress the average viewer (who is unfamiliar with engineering details) as being ‘way beyond’ where we are now. It was a very viewer-friendly show in that way, while the story line is a bit less so for being big, dark and extremely complex, like the universe.

<sup>3</sup> Citation: See <https://www.youtube.com/watch?v=mr7FXvTSYpA> for an explanation of the Kardashev Scale.

<sup>4</sup> Citation: “I find it somewhat perplexing that so few people seem to realize how big of a problem it is that progress in the foundations of physics has stalled. Part of the problem I think is that physicist themselves have been talking so much rubbish that people have come to believe that foundational work is just philosophical speculation and has lost any relevance for technological progress. Indeed, I am afraid that most of my colleagues now believe that themselves. It’s wrong, needless to say; a better understanding of the theories we use to make all these fancy devices, will certainly lead to practical application. Maybe not in five years, or ten years, but more in 100 years or 500 years.

But eventually, it will.” – Sabine Hossenfelder, “Physics is still in crisis,” Sabine Hossenfelder YouTube Channel, June 5, 2020.

<sup>5</sup> Citation: The von Braun quote referred to is from an article “Why I Believe in Immortality,” which, according to NASA’s bibliography page, was published in two books in 1962 and 1968. Full text of the article is apparently unavailable on the internet, there are different clippings on various pages some of which contain the quote, others not, and the quote appears frequently on quotes sites. On the bibliography compiled by NASA, von Braun had published an article titled “Immortality” in two magazines in early 1960.

✓ <https://www.nasa.gov/centers/marshall/history/vonbraun/bibliography.html>.

<sup>6</sup> Commentary: In the modern time, some (omit derogatory name-calling) people post videos on YouTube that are taken from movies like Khartoum (1966), Outpost Morocco (1949), or Four Feathers or a hundred other 20<sup>th</sup> century desert dramas, with smug, self-righteous, suggestive captions such as, “this is how they used to deal with Muslims.” Technology and industry have not solved the problem of those kind of (omit derogatory...) uh, people.

<sup>7</sup> Commentary & Citation: Compare the similarities of this statement by Arthur C. Clark to the feature quote by Alvin Toffler, top of the 7 Beginnings, p. 68, *supra*.

<sup>8</sup> Commentary & Citation: Pat Benatar’s album Live from Earth was one of the first records I owned, I probably bought it just after it was released in late 1983 (and I still have it, though I don’t have a record player now). If you don’t remember her screaming Hell is for Children, it is probably because the radio-play version was tamer. I grew so used to hearing the Live from Earth tracks that later when I heard radio-play versions of her songs, they sounded slow and tame, they didn’t sound right. I later saw her in concert at the Pittsburgh Regatta around 2000 – though she complained that she was tired of singing some of her songs (I think it was right before “Hit Me With Your Best Shot”) – her and her husband were fabulous, especially when they pretended to have a marital argument on stage, he ran off the back of the stage and hid out in the crowd, while she pretended to look for him from the stage and he played from the crowd. Thank the inventor of cordless amps!

<sup>9</sup> Commentary: “In one of the countless billions of galaxies in the universe, lies a medium-sized star, and one of its satellites, a green and insignificant planet, is now dead.” – ending narration to Beneath the Planet of the Apes (1970). When I was a young teen, an afternoon movie program called Dialing for Dollars, came on Channel 16 (Scranton, PA) at 4 p.m. to 6 p.m., Monday through Friday, followed by local and network news. Dialing for Dollars featured theme weeks where they showed for example, Clint Eastwood Westerns week, Time Tunnel week, Buck Rogers week, or John Wayne week, five thematically ‘related’ movies. Early Sci-Fi Channel had something similar, I remember in the early 90s a ‘time travel week’ where I discovered the excellent indie movie Navigator: A Medieval Odyssey (1989) – the other four movies that week were forgettable – one I think featured some ‘time quakes.’ Dialing for Dollars had a Planet of the Apes week when I was in about 9<sup>th</sup> Grade and, of course, I watched them all. It would have been a Tuesday, after school, when I watched Beneath the Planet of the Apes (what homework?). I remember my reaction was OMG, as I realized what kind of insanity was being served. The mutants and their bomb worship, and the ending, stuck with me for 35 years.

✓ “And what is even more extraordinary is that Beneath, as a result of its shortcomings, is one of the weirdest and most insane sci-fi films of its era. It’s strongly anti-war, even including a scene referencing the Vietnam protests of the time in which young pacifist chimps holding signs are physically moved aside by soldiers. Its surreal imagery – an illusion of a giant statue of the apes’ Lawgiver raining blood on a forest of crucified apes, the incredible church service in which dozens of deformed mutants sing a hymn to an atomic bomb – matches the first in terms of sheer originality, and that ending is among the bleakest the genre has ever offered. ... Two things the Apes movies rarely ran short of were strange concepts and bizarre imagery, and Beneath – while far from the best film in the series – may top them all in both departments.” – Don Kaye, “How Beneath the Planet of the Apes Nearly Buried The Franchise,” Den of Geek, May 25, 2018.

✓ “When Beneath the Planet of the Apes adheres closely to this theme of dueling cultures and clashing religious viewpoints, it proves rather impressive, in my opinion. And the mutant civilization, down to the presentation of the ruined city and the ghoulish make-up, is every bit as impressive as the special effects work done on the original Planet of the Apes. The moment here in which the mutants reveal their ‘innermost’ selves to their God, the bomb, is more than bracing. It’s ghoulish. The unmasking of the mutants may not equal the psychic jolt of the Statue of Liberty revelation in Planet of the Apes, but it certainly rivets the attention, and visually brings forth the horrific toll of nuclear war upon both the human flesh and the human visage. It also assures that this sequel contributes some real visual ‘punch’ to the franchise.” – John Kenneth Muir, “Cult Movie Review: Beneath the Planet of the Apes (1970),” July 27, 2011.

*See Appendix TECH – Technology Progress*  
*See Appendix UA – Uber Alles Lists*

*“The intelligent minority of this world will mark 1 January 2001 as the real beginning of the 21<sup>st</sup> century and the Third Millennium.” – Arthur C. Clarke*

**Uber Alles:** *Uber Alles* is a German phrase that means “above everything else”<sup>1</sup> – not a pair of overalls. Here the term represents an intangible quality or dimension, due to the combination of the discovery of physical laws and the accumulation of Applications such that their combined effect advances technology by an order of magnitude, and the changed worldview that results.

✓ The difference in Eras is like entering a literary contest against Runyard Kipling.

*Uber Alles* is a tangible, observable *gestalt effect*: What Mr. Harrison did with gears and counter-weights in inventing the maritime chronometer can now be done with a cheap digital watch.<sup>2</sup> This gestalt effect is not limited to technology but is also demonstrable on culture that uses the technology (e.g., “Out on the high seas without a GPS!” – Joe Block, Pirates broadcaster, July 22, 2019), e.g., popular music (see *The Music of Your Life*, 2 Culture, p. 367, *supra*); this will be the most difficult part for participants to imagine, the *Uber Alles* effect on cultural worldview.

✓ “Gestalt Effect” and “Gestalt Structure” are terms used in GGDM that are not readily found on the internet in 2018; any Google search for “gestalt” generally leads to pages about Gestalt Psychology and Therapy, occasionally, the search will yield a page about phenomenological theory. None of the main dictionaries have tackled the definition of these terms yet. The Gestalt concept of GGDM is discussed in the *dic-tum* section, 3 Fallen to Earth, *infra*; for now, ‘gestalt effect’ **used here** is a sort of an overall technological emergence.

- **Ut supra:** The *Uber Alles* for each Era is provided to each position by the Concierge, as soon as the position successfully prosecutes its first Patent in the new Era. The *Uber Alles* is provided by the Concierge to insure consistency in the physical laws (even if we don’t know the details) of the game universe. The *Uber Alles* won’t be the same for each game or for each Era, and constitutes a set of ‘mini rules’ that adds an extra ‘dimension’ to the technology of the new Era that sets it apart from the technology of the previous Era, and renders previous technology obsolete. The rules of the *Uber Alles* might affect Patents, the Matrix, and/or social factors of the position. Finally, the *Uber Alles* of an Era may continue to operate into the next Era (with a new *Uber Alles* being added) or it might be rendered obsolete by the *Uber Alles* of the next Era. There is no *Uber Alles* for the 1<sup>st</sup> Era.
- **Ut infra:** It is possible for the players to share the details of the *Uber Alles* with other players who have not yet advanced into the next Era, but doing so would likely be of little utility. Consider for example, that knowing Ohm’s law wouldn’t do a 17<sup>th</sup> Century watchmaker any good, so knowing the *Uber Alles* for the 2<sup>nd</sup> Era won’t affect 1<sup>st</sup> Era Patents much or at all.
- **Magic Formula:** The technologies of the 2<sup>nd</sup> and 3<sup>rd</sup> Eras are so far beyond what we now call technology that we cannot even begin to imagine their shape or operating principles; we can, in fact, only in the last century begin to imagine the shape and operation of Stardrive technology (e.g., see feature quote from US Patent Publication No. 20060073976 A1, 3 Temporal Technology p. 828, *infra*), the advent of which, in this game, marks the entry into the 1<sup>st</sup> Era of interstellar technology. Therefore, players should not look to the *Uber Alles* for any sort of logic, nor should they try too hard to find logical explanations for the *Uber Alles* given by the Concierge.

Because we don't know anything about what would constitute 2<sup>nd</sup> and 3<sup>rd</sup> Era technologies, following Clarke's Third Law (see Intonation of the Three, 1 Technology, p. 688, *supra*), the *Uber Alles* might as well be a magic formula (consider that our current technology of 'controlled lightening,' and more so – extracting power from unremarkable looking gray rocks in concrete buildings – must surely be the magic of the Gods to our distant ancestors). Rather, the only criteria of the *Uber Alles* is whether, first, it adds an interesting dimension (a twist some might say) to the next Era (the difference between the technology of the mechanical adding machine and the modern personal computer), and second, is it playable?

- Apprentices & Familiars: In “The Magician’s Apprentice” (2015), Dr. Who is confronted with a boy who is trapped in a minefield; the Doctor initially intended to save the boy until he realizes that it is Davros, his future enemy, the creator of the Dalek race that rages destruction across the universes. It is the classic ‘should I kill Hitler as a baby’ time-travel problem, except that Davros makes Hitler look like a rank amateur. The Doctor, unsure and torn, flits away in his time machine leaving the boy stranded. At the end of the following episode (“The Witch’s Familiar”), after defeating the future Davros once again and destroying his city, the Doctor returns to rescue the boy in the minefield, realizing that he must.

Although the story is nearly linear to the audience who can see all, being told in the normal three-act format (beginning, middle, end; *introduction, crisis, resolution*), it is not to the boy, who sees a man appear in a box out of nowhere who says he will save him, but then acts threatening, then disappears, then reappears and saves him from the minefield (of ‘hand-mines’) and escorts him home. The resolution of the boy’s and the Doctor’s crisis occurred in a time loop into the far future (and the Doctor’s past memories) in the few minutes between when the box disappeared and reappeared while the boy stood in the minefield.

- ✓ Had the Doctor resolved differently, killing the boy Davros, a paradox would have been created that unraveled the entire series from the second serial (1963) onward.

The TARDIS is perhaps the final and ultimate *Uber Alles* for whatever Era the Gallifreyians are in and serves as an example (for those familiar with Dr. Who) of the ‘other direction’ to which 2<sup>nd</sup> and 3<sup>rd</sup> Era civilizations might have access which we cannot see in the same way that a 17<sup>th</sup> Century watchmaker would not have imagined Dick Tracey-like iPhone watches.

---

*“This seems to be the law of progress in everything we do; it moves along a spiral rather than a perpendicular; we seem to be actually going out of the way, and yet it turns out that we were really moving upward all the time.”*

– Frances E. Willard

---

**Bottle Spin Whac-a-Mole**: Ms. Willard was playing the game of whac-a-mole discussed in 4 Culture, p. 404, *supra*. The mole was rampant alcohol consumption, she was a late 19<sup>th</sup> Century temperance campaigner and women’s suffragist. In the process, she used careless rhetoric that made alcoholism a racial issue instead of a holistic issue, and bumped up hard against the rising Civil Rights movement. The Temperance Movement had the bigger mallet just then, but peaked, whacked the mole, and imploded, leaving the stage to those trying to whack the mole of racism.

- ✓ To understand Ms. Willard’s reference, envision climbing a spiral staircase instead of taking an elevator that moves perpendicular to the ground to reach your destination.

Every half turn along the spiral stair, you are seeming to be moving in the wrong direction horizontally, but you are still climbing up. Whereas in an elevator, you look bored, listen to elevator music, and check your voice mail, Twitter, or text messages.

- ✓ The implosion of the Temperance Movement following the Prohibition Era is discussed in *Flying the Banner*, 4 Government Titles, p. 632, *supra*.

**Spiral-Perpendicular Discussions:** How to visualize an emergence? The simplest way is a pair of perpendicular lines joined, the emergence is moving off at ‘right angles’ from the origin.<sup>3</sup> But that is a crude two-dimensional representation. What is the three-dimensional equivalent?

This is the same as the question asked by Kip Thorne who was the science consultant for *Interstellar* (2016): We have been picturing black holes as two-dimensional objects on the ‘surface’ of space (like a whirlpool on the surface of the water), but in the process of working on the film, he asked, what is a circle in three dimensions? A sphere.<sup>4</sup>

- ✓ Three-dimensional space is not likely even the proper means to envision an emergence, since there is necessarily a time element to it. Likely then the real question is what is a perpendicular pair of lines in three-dimensional space with forward time effect. That is way beyond my topology, but visualizations I have seen of a spatial movement in time have been shown as a spiral or helix in an attempt to display a fourth dimension of movement (on a two dimensional page). Like Ms. Willard’s spiral staircase, instead of a perpendicular elevator.
- ✓ But here’s the thing: Kip Thorne wasn’t asked to explain why the universe is ‘designed’ or evolved so that black holes exist. He was asked to provide scientific thought on how to accurately portray a black hole in a film, and from that sprang certain insights that apparently had not occurred to anyone before his team tried to accurately visualize a black hole on film.<sup>5</sup> Likewise, GGDM only has to simulate emergent technology in a game. Thus only a vision of the concept is needed.

There is a parallel sense between what Kip Thorne did for the movie *Interstellar* (2016) and what I have done in GGDM, see *The Problem of Immersion* discussion 1 Culture, p. 352, *supra*. The difference is one of orders of nature, differences in perceived empirical respectability between first and fourth order knowledge, resources and current cultural interests in the topics.

- ✓ “[Dr. Who] was created to fill a gap between children’s and young adult programming.” – from Wikipedia article, “An Unearthly Child.” “The programme was originally intended to appeal to a family audience as an educational programme using time travel as a means to explore scientific ideas and famous moments in history.” – from Wikipedia article, “Dr. Who.” Dr. Who has moved a long way from its intended ‘no bug-eyed monsters’ function; time-travel fiction cannot help but to be existential, and when the existential is avoided, it just becomes silliness. GGDM’s evolution over time has paralleled that of Dr. Who, conversations about civilization cannot help but to become existential; when avoided, they just become gloss and cliché.
- **Uber Emergents:** Each Uber Alles consists of two parts, one is related to activation of the Technology Power and the second is not related directly to the Technology Power. The pairing of Technology Power and non-Technology Power effects provides endless interesting combinations of effects (with no explanation necessary, it is effectively ‘magic’) and sufficiently simulates the perpendicular nature of emergences. Ten pregenerated Uber Alles are

provided for each category so that the Concierge may simply generate – either randomly or by considered choices – new Uber Alles pairs for each Era. It may also be possible for participants to create new Uber Alles effects.

- **Diagonal Play:** Imagine playing a game of chess or checkers without diagonal movement? The knight is a pretty darned good piece, but is very limited, imagine a game without bishops or pawn captures? There is probably a sociopolitical reason why bishops move diagonally.
  - ✓ I play Hashira, a tile falling game like Tetris (there is a “Let’s Play Hashira” video on YouTube). One of the keys to my modest success (I have barely topped 100,000 points a couple of times) is playing the diagonals. I first noticed that exploiting diagonals tended to ‘fix’ problems with the current board, bringing things into alignment and sometimes creating chain reaction eliminations. As I became more cognizant, I understood that chain reactions are extremely important not only for scoring, but for keeping the board from filling up which ends the game. I became more aggressive, creating diagonals instead of letting them occur naturally, it works as long as it is integrated with the other plays and the cat doesn’t jump on your desk and hit your face with his tail while you are trying to play – the universe engages in diagonal plays too!

To humans, diagonal represents the ‘other direction’ in a two-dimensional game that we import into our lives in thinking about our time and space and future possibilities.

- ✓ Cats are a little short on cause and effect; there is no way I can make him understand that whatever I am doing with my hands has anything to do with what is occurring on the computer screen in front of me, or of any importance to what he wants at the moment, and he doesn’t care (i.e. has no reason to look). Comprehending causality and caring outside ourselves (even for selfish reasons) are both diagonals of sapience (and the super-organic) that we teach children.

---

*“Finnerty shook his head. ‘He’d pull me back into the center, and I want to stay as close to the edge as I can without going over. Out on the edge you see all kinds of things you can’t see from the center.’ He nodded, ‘Big, undreamed-of things – the people on the edge see them first.’”*

\*\*\*

*“It was an appalling thought, to be so well-integrated into the machinery of society and history as to be able to move in only one plane, and along one line.”*

– Kurt Vonnegut, Player Piano (1952)

---

**Player Piano:** The receipt of one Act or Scene per undisrupted Government Title (see On the Soapbox, 3 The Sidereal Stage, p. 122, *supra*) is intended to be a challenging management problem for most of the game. Scarcity leads to discipline and innovation. It is also intended to realistically – if that is possible – represent the complexity and political will of nascent interstellar civilizations. But, of course, at some point the limit may become an impediment to the game.

- ✓ Scenes especially represent inbuilt systemic inefficiencies: The larger a position becomes, the lower the percentage of colonies (and population) that will be subject to Power Activations each Regular Turn (or regularly), like being the only child vs. being one of ten; many familial problems are caused when the only child is no longer.

- More or Less: Technology has multiplied the effectiveness of each person in doing a job. For example, half a century ago, each attorney had a secretary who filed, took phone calls and spent much of the day typing from a Dictaphone.
  - ✓ Emperor Napoleon I had a dozen male secretaries, who would take turns in his office scribing letters as he dictated them. Napoleon Bonaparte dictated letters, laws, orders, dispatches, for 12 or more hours a day.
  - ✓ Adolf Hitler had four female secretaries.

Now one secretary works for multiple attorneys, some attorneys do not have secretaries, much is done by email, and most young attorneys are proficient at doing their own typing and formatting. Legal research is done online, instead of the associate going to the law library or the firm keeping an expensive hardbound law library which takes up office space.<sup>6</sup>

- ✓ But we all still have the same amount of minutes in a day. What technology does – theoretically – is to allow us to do more in the same amount of time. Many would dispute the truth of that, and say what we have to do in a day has simply shifted or that the newfound time has been quickly filled with other complexities. Because to add technology to solve problems is to add layers of complexity (*à la* Joseph Tainter).

The scarcity of Acts and Scenes and Power Activations in GGDM should be interpreted as a time function, a day in the life of a civilization. Since we all still have the same number of minutes in a day as each person had in the Middle Ages, participants should be *very careful* about changing the established rules on Acts, Scenes and Power Activations. The most direct way to gain time in a day is time travel, if you could be in two places at once, even for short times, you could make your day into 25, 26, 30 hours. It may also be possible that time gained from the multiplying effect of technology does outstrip the additional complexity so that there is some modern benefit (which explains the apparent acceleration of our lives), and that certainly might be the case with the technology assumed to exist in GGDM.

Within GGDM, the Concierge may optionally, allow more Acts and Scenes to positions that have reached the 2<sup>nd</sup> Era, for example, one Act plus one Act or Scene received per undisrupted Government Title. And in the 3<sup>rd</sup> Era, either two Acts or two Scenes (a choice to keep it interesting) received per undisrupted Government Title. This would definitively separate positions of different Eras *by an order of magnitude* and provide positions with an incentive to advance quickly through the technology Eras. It would also penalize positions that fall behind, like the fictional medieval state in the modern world in Leonard Wibberley's 1955 novel, The Mouse that Roared.

This does not equate to a position receiving more *Power Activations* in a Regular Turn (cf. Gone with the Wind discussion in 1 Government Titles, p. 582, *supra*); extra Acts and Scenes represent only the *power of opportunity* – technology and ‘advanced cultural sophistication.’ Early in the game, there will be turns where positions do not use all Power Activations, either holding back building-up for expensive Power Activations or because they have expended Acts and Scenes in a flurry of activity. The effect of the extra Acts and Scenes will be fuller use of available Power Activations, less fear of more expensive Power Activations.

- ✓ See additional scarcity discussions, Shoestring Production, 3 The Sidereal Stage, p. 122, *supra*, and Corporation Games, 1 Corporations, p. 1243, *infra*.

- Technological Unemployment: Everyone knows that when employers can pay less people to do the same work, they will; long term savings is the selling point of capital investment and software upgrades, social responsibility much less so. This is generally called Technological Unemployment, and demonstrates that the increase in productivity which leads to additional Acts and Scenes is also an opportunity for creative Interventions by the Concierge.

Generally technological progress has been a see-saw ride, each person can do more, but with explosive growth in populations and complexity, and knowledge, there is much more to be done as well. This pattern is well established. As Joseph Tainter notes, improvements in agriculture in the Proto- and Pre-Classical times to solve the food problem only resulted in increases in population, starting the cycle over again (see 2 Government Titles, EN 9, p. 604, *supra*, for full quote).

- ✓ “Cultural factors that develop independently from environment are the wildcards that have made history unpredictable. The use of the QWERTY keyboard and Chinese pictographic writing represent cultural developments independent of environment that have actually had relatively negative effects on societies – our inefficient typing system and the lower levels of Chinese literacy due to the difficulties of their writing system.” – Jared Diamond, Summary of Guns, Germs, and Steel (2017), pp. 45-46, Kindle Edition.

Technology multiplies the power of individuals in all endeavors, but also multiplies the complexities and demands of our civilization. GGDM civilizations are likely not immune from all of that.

The relationship of technology, social change, unemployment, capitalization and economics is a huge and hotly-contested intricate subject into which participants can delve on their own. Charles Dickens wrote during the time in which England was being most affected by the Industrial Revolution (see Gradgrind, 1 Colleges, p. 463, *supra*), but the process of enclosures, tenancies, and population shift to urban areas had already begun two centuries before with the Agricultural Revolution intensification that allowed less farm workers to produce more food per acre, and additionally, to work more farmland (see enclosure discussion and Raymond Birn quote in 3 Reformation, EN 3, pp. 1404, 1412, *infra*). The most famous starting point in the debate are the so-called Neo-Luddites, named after the Luddites of the 19<sup>th</sup> Century; the Luddites were also an anti-technology faction in a science-fiction space wargame (called Third Foundation) I played long, long ago! But there are many arguments across many disciplines on this, the most important socioeconomic subject of the 20<sup>th</sup> Century.

- ✓ “Anita had the mechanics of marriage down pat, even to the subtlest conventions. If her approach was disturbingly rational, systematic, she was thorough enough to turn out a credible counterfeit of warmth.” – Kurt Vonnegut, Player Piano (1952).
- Watching the Wheels Go Round and Round: There are other thresholds for increasing Acts and Scenes which might define a new Era of the game or for a position, in a non-technological sense. For example, the Concierge may determine that all positions get the first increase in Acts and Scenes after Turn 20 and maybe the second increase after Turn 40 or 60, if the game lasts that long. Or the increase may be based on position population thresholds, such as 300, 500, or 1000 total population factors on Converted, Friendly and Naturalized Colonies.

Other possible markers for the end of an age in GGDM, might include all positions having made First Contact (see *A Bump in the Night*, 1 Diplomacy, p. 1099, *infra*), or perhaps radical shifts in Structural Government Titles (see *Home-Wreckers*, 6 Government Titles, p. 651, *supra*). Or possibly even physical extinction of one or more of the Major Races in the Galactic Space (see *Countdown to Extinction*, 1 Resolution, p. 1462, *infra*). Most likely, a combination of factors will be in play.

There are also many hybrid thresholds that might be devised. Inherent in GGDM, as with most competitive games, is the potential for the big to get bigger, the rich to get richer and everyone else to get smaller and poorer (or drift away), and the first positions to gain the extra Acts and Scenes will have a definite advantage over the long term. The participants will need to decide what sort of game they like, what flavor to add to their own GGDM game.

*“The French and Hussites had already demonstrated the power of artillery in the field, and now the fall of Constantinople gave proof that the mightiest walls no longer offered a refuge against gunpowder. Yet that May morning in 1453 is remembered as more than a tactical landmark. For a last spiritual link with the ancient world had been broken, and henceforward men would feel free to turn their eyes toward the future rather than the past.”*

– Lynn Montross, *War Through the Ages* (3<sup>rd</sup> Ed., 1960), p. 195

**Bulwark of the Past:** Constantinople was the most powerful city in Europe for most of the Middle Ages. The Crusades passed through and became entangled in Constantinople, the Fourth Crusade attacked and sacked the city in 1204, destroying or carrying off countless historical treasures that are now lost. Constantinople was the last link to the Roman Empire and the Classical Ages. It could be considered a *Symbolic Constructural Element* in GGDM terms, within the worldview of ‘feudal Europe.’ Conquest of Constantinople (renamed Istanbul) also provided a gateway to Europe allowing the Ottomans to conquer all the way to Hungary; the Habsburg-Ottoman-Polish contest over two centuries shaped modern Eastern Europe, especially Romania.

- ✓ “After the sack, many feared other European Christian kingdoms would suffer the same fate as Constantinople. Two possible responses emerged amongst the humanists and churchmen of that era: Crusade or dialogue. Pope Pius II strongly advocated for another Crusade, while Nicholas of Cusa supported engaging in a dialogue with the Ottomans. The Morean (Peloponnesian) fortress of Mystras, where Constantine’s brothers Thomas and Demetrius ruled, constantly in conflict with each other and knowing that Mehmed would eventually invade them as well, held out until 1460. Long before the fall of Constantinople, Demetrius had fought for the throne with Thomas, Constantine, and their other brothers John and Theodore.

Thomas escaped to Rome when the Ottomans invaded Morea while Demetrius expected to rule a puppet state, but instead was imprisoned and remained there for the rest of his life. In Rome, Thomas and his family received some monetary support from the Pope and other Western rulers as Byzantine emperor in exile, until 1503. In 1461 the independent Byzantine state in Trebizond fell to Mehmed.” – from Wikipedia article, “Fall of Constantinople,” captured August 12, 2019.

Thomas died in 1465 and his son (and royal beggar) Andreas Palaiologos (brother of Sophia (Zoe Palaiologina) whose marriage to Ivan III of Moscow was arranged by the Pope) sold his crown and all rights in 1494 to the King of France. Had Constantinople been ‘liberated’ after 1494, it would have been claimed by Charles VIII of France and several French kings thereafter claimed to be Emperor of Constantinople (for what it was worth) until 1566 (at which time the claim was considered extinct and pointless). Andreas Palaiologos allegedly sold his crown and rights a second time to Queen Isabella I of Castile and King Ferdinand II of Aragon (of Christopher Columbus fame).<sup>7</sup> Despite all, he died in poverty in Rome in 1502 and no members of his family claimed right to Emperor of the East. Just like the last Western Roman Emperor.

*“The pomp of chivalry had increased in proportion to its weakness, and at Agincourt in 1415, the French host of 40,000 was literally an army with banners. But even though a pennon or standard fluttered over every contingent, the display only served to commemorate one of the last great efforts of a dying feudal age.” – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 182*

**A Dying Age:** All of the things that we know gradually and collectively marked the end of the Middle Ages would not have been apparent to the combatants at Agincourt as they trudged through the mud on a soggy cool fall day in 1415. Not one person present would have had reason to think that the world as they knew it would not go on forever (or at least into the time of their grandchildren’s children, which is the same as forever for most people) unchanging.

There were reportedly some primitive cannons and handguns at Agincourt, but not enough to be more than a noisy curiosity. The walls of Constantinople were yet to be battered down by Turkish cannons (in 1453), rendering all castles and fortified cities in Europe vulnerable to the same fate as the power of cannons improved over the next century (and leading to the centralization of government power). The Portuguese had not yet reached India (in 1498), and as we all learned in school, Columbus had not yet discovered the New World (in 1492).<sup>8</sup> The War of the Roses was still 40 years in the future, two generations hence. Sir Francis Bacon wasn’t to be born for another 145 years, and his vision had to wait another century after his death to emerge.

The events that might have been worrisome to the sages of the age would have been the Black Death, which passed through France, reaching England in about 1349-1350, a dark, continuing nightmare for which there seemed no cure and no end. The very concerning Western Schism of the Papacy (1378-1417) was finally nearing an end in 1415. And the last part that would have concerned the sages of the day, the Ottoman advance into the Balkans around the ailing, feeble Byzantine Empire,<sup>9</sup> and the ultimate failure of the Crusader States in the Holy Land and Cyprus.

So here we have a balance of things:

- 1) Those things that would have been the worldview of the participants on the ground at the time,
- 2) Those things that we know from hindsight, that historians glowingly state led inexorably to the end of the age or era in question, and
- 3) Those signs and events that would have been known and worrisome to the wiser and more educated minority of the time.

GGDM is a game (like any of this kind) during which the civilizations (both collectively and individually) may seem to pass through ages;<sup>10</sup> most likely, those ages will be tied approximately to the progression of Technological Eras. And as noted previously, there will be those who see an age coming to an end, those historians who will retroactively mark the end of an age in glowing, finalistic terms, and those on the ground – the ship crews, the colony populations, the soldiers, the explorers, the governments, the corporate types – who think that their current lifestyles will go on forever, generation after generation. It is an important distinction to remember when participating in GGDM that what the players or Concierge may know or see as the approach of the end of an age should not necessarily affect the people on the ground.

At the bottom of much of space-opera and solar system colonization science-fiction literature is the coming-of-age idea of leaving the nest and wandering afar in the galaxy.

✓ **Prof. Brand:** So how do you plan on saving the world? **Cooper:** We're not meant to save the world, we're meant to leave it. – Interstellar (2014).

Age and Era are distinguished here only because GGDM uses Eras for Technological Progression. Out in the wild, wide world, the two terms are often used interchangeably, and carelessly.

➤ **Crusade:** Many people bristle now at the mention of 'crusade,' thinking it an anti-Islamic term, and Islamic extremist exploit that idea with their propaganda. In other times, 'crusade' in English has been disassociated from its historical roots and simply means a great, ongoing focused effort, usually against some perceived medical or social problem (another name for the game of whac-a-mole). Historically however, a 'crusade' (a term not invented in English until after 1700 A.D. according to Merriam-Webster online dictionary) was used generally by the Roman Catholic bloc against anyone who wasn't part of Roman Catholic Europe, for example, the Northern Crusades against the Eastern Orthodox Church and various Slavic pagans, or against heresy, such as the Albigensian Crusade against the Cathars in the County of Toulouse and against the Crown of Aragon in Southern France. While crusade is an offensive term in this respect, it is because of militant religious expansion and suppression against *anyone* who didn't share the Roman Catholic beliefs or submit to the Lords Spiritual of Western Europe.

---

*“Her freenom, Gupta, she chose homage a Sanjiro Gupta, an ark administrator of the early First Starfaring Age, who left the system of Sol with a consignment of stellar colonists dredged up from the deepest political dungeons of a consortium of sponsoring national governments, and arrived three generations later as the guiding memory of the sanest political system of the day, the forerunner of our modern transtellar society. Though this model colony ship society did not long survive planetary dispersion, and the proto-Lingo that had evolved soon began to break down into its constituent sprachts, it was Sanjiro Gupta who tossed the first pebble of modernity into the dark pool of that chauvin-ridden age, whose time-amplified ripples are the social mantra of our day.” – Norman Spinrad, The Void Captain's Tale, p. 10, Kindle Edition*

---

**Second Starfaring Age:** Norman Spinrad published two books (The Void Captain's Tale (1983) and Child of Fortune (1985)) set in the Second Starfaring Age, 3,000 years in the future (the same number is used in the 2016 movie Arrival, a possible nod to Spinrad).

It is clear from his history that the First Starfaring Age consisted of sub-light generational starships. The Second Starfaring Age started with the discovery of the Jump Circuit, from alien

technologies left behind by *We Who Have Gone Before* (similar to the later *Babylon 5* television series, 1993 to 1998, and *Race for the Galaxy* card game, 2007).

It would be very interesting if Mr. Spinrad were to write even a short story or short novel describing – in his own inimitable manner – how the Jump Circuit was discovered. Mr. Spinrad is one of the few science fiction writers to write challenging novels set in a very distant, very different future trans-stellar civilization.

Sanjiro Gupta is the Sir Francis Bacon of Spinrad's First Starfaring Age. "Proto-Lingo" is the forerunner to some sort of trans-stellar human language that Spinrad attempts to simulate in his Second Starfaring Age books by mixing about 20% foreign (European) words into English. This is a subject that is only lightly mentioned in GGDM, and sci-fi tends to sidestep the problem with gadgetry such as universal translators, telepathy, or just completely ignores the problem.

- ✓ Notably, Harry Harrison's 1964 short story, "Final Encounter" (discussed in *Circumambulation*, 1 Expansion, p. 875, *infra*) goes into some detail of an AI-assisted process of translating and reconciling two languages that are discovered to be from the same root Earth language, with hundreds of centuries of linguistic drift.
- ✓ The movie *Bladerunner* (1982) also gives a brief nod to the problem by mentioning a mash-up language, "Cityspeak" (invented by actor Edward James Olmos, something more substantial than a *street cant*), but then moves on as Cityspeak is just background, setting window dressing.

But considering that Afrikaans is only 350+ years separated from Dutch and already shows significant divergence; within the timescales of GGDM, this drift would soon become a major problem for interstellar civilizations. See *Language Drift*, 3 Entropy, p. 246, *supra*.

Since the 19<sup>th</sup> Century, various attempts have been made at forming a universal human language, or forming international auxiliary languages (IALs, 'auxlangs') with limited success – while the languages exist in theory (the most popular being Interlingua, Ido, and Esperanto), very few speak them and they are not easy to learn. Instead, the natural trend has been toward international standardization of existing languages spread by European colonialism (with the usual objections, of course), such as International English and Mediterranean Lingua Franca. What happens when we go to space?

---

*"Every epoch dreams its successor"*

– Jules Michelet (1798-1874), French Historian

---

## Endnotes.

<sup>1</sup> **Citation & Commentary:** "From the verse *Deutschland, Deutschland über alles, über alles in der Welt* ('Germany above all, above all in the world'), from the German national anthem *Lied der Deutschen*, composed by Joseph Haydn in 1797. The verse originally meant that the Germans and their rulers have to overcome existing divisions and keep in mind the goal of a unified Germany." – From Wiktionary entry for "über alles," August 22, 2018 (italics in original). Like any politicized phrase, there are various claims; some claim that the Allies in WWII deliberately mistranslated it for propaganda purposes, others claim that the meaning is a myth. The various inane arguments will not be repeated here (as they are irrelevant to the instant purpose of this text), *Google It!*

<sup>2</sup> **Commentary:** The award-winning television mini-series, *Longitude* (2000), tells the story of the invention of the maritime chronometer by John Harrison in 1730 in competition for the prize offered by the Longitude Act of 1714. The film demonstrates an entire political and cultural struggle in early 18<sup>th</sup> Century England, between science and

religion, astronomy and astrology, the needs of the Royal Navy (and the fact that no one had even determined the longitude of Jamaica before testing the maritime chronometer), leadership senility, and the entire English system's prejudice against a self-educated Scottish carpenter, John Harrison, winning the Longitude Prize.

<sup>3</sup> Commentary: I had been thinking about Uber Alles off and on for a few days. In mapping out the end route to finish GGDM in March 2019, I had realized that I still needed to create a half dozen Uber Alles, a task, unlike Government Titles or Fundamental Realities, that I had never previously tackled (that is, I had written both of them years ago and revised them during the final edit, so I had at least a concept in mind). For Uber Alles, the question was, how do I simulate an emergence, at least a technological emergence? We have historical examples, which I have used in GGDM, but how do I translate those into a game which does not have a history?

- ✓ Late on March 10, 2019, I watched the movie *Annihilation* (2018). After I got up, all the sudden it clicked in my mind, the question of how do you visualize an emergence? *Annihilation* is a very strange movie, and I am glad to have seen it regardless of the subsequent outcome, but what happened in that moment of intuition a very few minutes after the movie? Does the movie contain some kind of *subliminal* messaging? Was it perhaps a practical demonstration of whatever a perpendicular line is in four dimensions? Most people think that time is a fourth dimension, see *Humanity in a Box* discussion 3 Reformatations, p. 1407, *infra*.
  - Rhetorical Question: Does subliminal messaging work only if there is a 'teachable moment' in the viewer for that message? Or does it work regardless of whether the viewer has reached the 'teachable moment' for the message? See *Teachable Moment*, 1 Kairotic Moment, p. 1418, *infra*.
- ✓ The difficulty that the film *Annihilation* (2018) has with audiences is that the audiences don't think in terms of emergences; the concept is not enculturated yet, we think mainly in straight lines and causalities. The film is about an emergence. Though critics understood the mastery and the risks that the film took, it was considered a box office bomb in 2018; the audiences didn't get it.
  - Unfortunately, because this impressive adaptation of award-winning novels was a box office bomb (thanks to our current culture milieu), it is very unlikely that the second and third movies will be made in the Southern Reach trilogy (Paramount Pictures owns the movie rights for the entire series). It's that money thing again, the intellectual value of the work is irrelevant next to colorful big budget movies with big explosions, cool gadgets and effects, and empty-minded silliness (e.g., *Star Trek 2009*, *Back to the Future* trilogy, etc.).
  - I have tried very much to develop an internal image of what an emergence looks like, how to recognize them. I would never have thought of the idea behind the movie *Annihilation* any more than Charles Babbage would envision a modern PC but I could recognize the intent when I saw it, and that will have to do for now. It is like a late medieval painter trying to find another way to do art, who is presented with a humanist work of Raphael from two centuries in the future: We know that one led to the other, but placed side by side, they are clearly much different concepts.

<sup>4</sup> Citation: "Even black holes wear makeup in Hollywood. Last year's hit film *Interstellar* used real scientific equations to depict what happens when a team of space farers venture near a supermassive black hole. Now, a joint paper published in the journal *Classical and Quantum Gravity* from the movie's visual effects team and scientific consultant reveal that the real black hole ... was deemed too confusing for audiences, and some of the science had to be toned down. *Interstellar*'s premise was first conceived by physicist Kip Thorne of the California Institute of Technology, who wanted to make a realistic movie about black holes. He got together with director and co-writer Christopher Nolan, and also with London-based visual effects studio Double Negative to create the movie's black hole, Gargantua. ... The most striking element of *Interstellar*'s Gargantua is its accretion disc, the glowing ring of matter that encircles it. The team started out using a simple, rainbow-coloured flat disc to figure out how it would be warped by the black hole, then exchanged it for a more wispy disc with realistic colours. The result looked good, but the central black hole seemed to be squashed up against one side. That's because the movie's time dilation effects meant the black hole had to spin very fast, causing it to drag the light to one side. Nolan didn't like this asymmetry and thought moviegoers wouldn't understand why, so the team slowed it down, says James." – Jacob Aron, "Interstellar's True Black Hole is Too Confusing," *New Scientist*, February 13, 2015.

- ✓ "Kip Thorne looks into the black hole he helped create and thinks, 'Why, of course. That's what it would do.' This particular black hole is a simulation of unprecedented accuracy. It appears to spin at nearly the speed of light, dragging bits of the universe along with it. (That's gravity for you; relativity is superweird.) In theory it was once a star, but instead of fading or exploding, it collapsed like a failed soufflé into a tiny point of inescapable singularity. A glowing ring orbiting the spheroidal maelstrom seems to curve over the top and below the bottom simultaneously. All this is only natural, because weird things happen near black

holes. For example, their gravity is so strong that they bend the fabric of the universe. Einstein explained this: The more massive something is, the more gravity it produces. Objects like stars and black holes do this so powerfully that they actually bend light and pull space and time with it. And it gets weirder: If you were closer to a black hole than I was, our perceptions of space and time would diverge. Relatively speaking, time would seem to be going faster for me. What does Thorne see in there? He's an astrophysicist; his math guided the creation of this mesmerizing visual effect, the most accurate simulation ever of what a black hole would look like. It's the product of a year of work by 30 people and thousands of computers. And ... the simulation plays a central role in *Interstellar*, the prestige space travel epic directed by Christopher Nolan opening November 7. Thorne sees truth. Nolan, the consummate image maker, sees beauty. Black holes, even fictional ones, can warp perception." – Adam Rogers, "WRINKLES IN SPACETIME: The Warped Astrophysics of *Interstellar*," *Wired.com*, October 2014 (CAPS IN ORIGINAL).

<sup>5</sup> Commentary & Citation: After the movie, the scientific team published a paper in the journal *Classical and Quantum Gravity*.

<sup>6</sup> Commentary: My first job in a law firm was as a part-time law librarian, which involved insertion of pocket parts, hunting down missing books, setting up lunch seminars, and the people at Westlaw who hear only what they want.

<sup>7</sup> Commentary: A similar situation is the premise of the board game *Nexus Ops* (2005). An explorer sold the claim to a planet four times – to four massive spacefaring corporations. He disappeared with the goodies, and the four corporations went to war over control of the planet. Another wonderful Intervention idea for the Concierge.

<sup>8</sup> Commentary: Foreign colonization and trade lifted Europe out of general poverty, upset the European feudal economy, and most importantly, provided monarchs with a source of income not tied to the feudal system, thus allowing the building of national armies, and other initiatives that eventually consolidated power to the central government, and away from the feudal lords and guilds. Remember this when reading the Commerce section, later.

✓ See previously Why Europe and the West excerpt at the beginning of this section.

<sup>9</sup> Commentary & Citation: Lynn Montross, who was certainly aware of the criticism that his spiritual ancestor Edward Gibbon (*The History of the Decline and Fall of the Roman Empire* (pub. 1776-1788)) *had entirely neglected the important contributions of the Byzantine or East-Roman Empire*, used two chapters in *War Through the Ages* (3<sup>rd</sup> Ed., 1960) in paying handsome tribute to the accomplishments of Byzantine arms, diplomacy and strategic position. It was partially attributable to the Byzantine Empire that the Battle of Tours was fought in 732 A.D.

✓ This same criticism is true in movie-making; critics have noted that there are very few Hollywood movies that show Byzantines or that are about the Byzantine or East Roman Empire. It is as if the West, especially across the Atlantic, *has an inexplicable blind spot to that immense period of history* covering just about any history south of the Danube, except ancient Greece, or north, south or east of the Black Sea; there are hundreds of 'Roman' (as in Western Roman Empire) movies, many of which are considered classics of cinema (e.g., *Ben Hur* (1959), *Quo Vadis* (1951)). Movies about the Byzantines are more the subject of local nationalism, e.g., the Bulgarian movie, *Khan Asparuh* (1984) (heavily edited, reduced, released internationally as *681 AD: The Glory of Khan* in 1984) made to mark the 1300<sup>th</sup> anniversary of Bulgarian nationalism.

✓ The 1968 West German movie, *Kampf um Rom* (aka *The Last Roman*) focusing on the intrigues between 6<sup>th</sup> Century Romans (who actually live in Rome), Ostrogoths, and a Byzantine General to reclaim Italy received poor critical reviews. Likewise, the very expensive 2016 Russian movie *Viking*, about Vladimir the Great, Prince of Novgorod (the Novgorod Republic remains dear to Russian nationalism) features some Byzantine diplomatic contacts and an attack on a Byzantine colony in Crimea, and was panned by critics.

<sup>10</sup> Citation & Commentary: "It was the dawn of the Third Age of Mankind..." – *Babylon 5*. At some point in the development of the game, I did consider creating a mechanic or cycle to mark the passage of ages or epochs. It was too arbitrary and the game didn't develop in that way, though some of the elements of the game – Technological Eras, and Reformations, and Kairotic Moments, *infra* – possibly evolved from the general idea of ages and epochs. Additionally, the whole general thrust of the game is toward epic civilization.

✓ "The scientific-technical revolution that reinvigorated the industrial revolution at the turn of the 20<sup>th</sup> century was not due to any one specific scientific discovery or single invention.... While some have named succeeding ages – coal, oil, nuclear energy (and since [Harry] Braverman, the computer and biological revolutions) – it is not these developments that clearly mark the age. Rather, the age can only be understood as one in which science and technology has become an adjunct to capitalism, an age in which science and technology are systematically developed, shaped and exploited to expand capital." – Frank Elwell, *Macro Social Theory* (2009), Kindle Edition, p. 60.

## Quark Fusion – Pop and Fizzle Excerpts from November-December 2017

### Excerpt from “Fusion breakthrough explained: What are quarks again?”

Charlie Wood, Christian Science Monitor, December 11, 2017

“Quark fusion” may sound like “Star Trek” technobabble, but a recently confirmed particle could be the result of this process – an explosive reshuffling of some of nature’s smallest constituents.

#### **Q: What are quarks again?**

You’re looking at quarks right now. Magazines, screens, and air are made of atoms, and atoms are largely made of protons and neutrons – which are the most familiar examples of the three-quark bundles that physicists call baryons. Quarks come in six varieties: up, down, strange, charm, top, and bottom. Up and down quarks form protons and neutrons, while the unstable and much heavier strange, charm, top, and bottom quarks tend to transform into lighter particles fractions of a second after being created.

### Excerpt from “‘Quark Fusion’ Produces Eight Times More Energy Than Nuclear Fusion”

Dom Galeon, Futurism, November 6, 2017

To reduce the emissions fueling climate change and develop more efficient ways of generating energy, while focusing on the bottom line, governments and private institutions all over the world have been turning to renewable energy. And while solar and wind energy advance and become more widely accepted, scientists continue to explore the possibility of stabilizing nuclear fusion as a truly renewable energy source that far outperforms current options.

But what if there’s an even better source of energy that’s also potentially less volatile than nuclear fusion? This possibility is what researchers from Tel Aviv University and the University of Chicago proposed in a new study published in the journal *Nature*.

This new source of energy, according to researchers Marek Karliner and Jonathan Rosner, comes from the fusion of subatomic particles known as quarks. These particles are usually produced as a result of colliding atoms that move at high speeds within the Large Hadron Collider (LHC), where these component parts split from their parent atoms. It doesn’t stop there, however, as these disassociated quarks also tend to collide with one another and fuse into particles called baryons.

It is this fusion of quarks that Karliner and Rosner focused on, as they found that this fusion is capable of producing energy even greater than what’s produced in hydrogen fusion. In particular, they studied how fused quarks configure into what’s called a doubly-charmed baryon. Fusing quarks require 130 MeV to become doubly-charmed baryons, which, in turn, releases energy that’s 12 MeV more energy. Turning their calculations to heavier bottom quarks, which need 230 MeV to fuse, they found that a resulting baryon could produce approximately 138 MeV of net energy – about eight times more than what hydrogen fusion releases.

### Excerpt from “Particle Physics Discovery: Fusing Heavy Quarks Can Produce 10 Times More Energy Than Nuclear Fusion”

Allan Adamson, Tech Times, November 7, 2017

Melting elementary particles such as quarks can produce amounts of energy so massive it is equivalent to 10 times that of nuclear fusion, researchers have reported.

## Quarks

Quarks are the most basic building blocks of matter. The protons and neutrons that make up matter are composed of quarks. Unlike protons and electrons, which have charges of +1 and -1, however, quarks have fractional electric charge. Quarks that are joined together form composite particles called hadrons. Quarks come in six flavors namely: up, down, top, bottom, strange, and charm.

### Fusion Of Quarks Can Produce Massive Amount Of Energy

In a new study, researchers showed that two bottom quarks could theoretically fuse together in a powerful flash that can result in massive amount of energy that can spill out into the universe.

The fusion of two bottom quarks will produce 138 megaelectronvolts (MeV), which is eight times more powerful than individual nuclear fusion events inside a hydrogen bomb.

### Is There Reason To Worry About Threats From A Quark Bomb?

Researchers, however, said that this kind of quark fusion could not be used to make a powerful quark bomb.

#### Excerpt from “Physicists Just Discovered Such an Explosive Type of Fusion They Almost Hid The Results”

Mike McCrae, Science Alert, November 3, 2017

A pair of physicists discovered a new kind of fusion that occurs between quarks – and they were so concerned with its power they almost didn't publish the results.

It could have been the dawning of a new subatomic age. But as they've explored the idea they've discovered there are limits to its potential that we can be both disappointed by and thankful for all at once.

The discovery of this highly energetic form of fusion between quarks comes with limits that make it an unlikely candidate for any kind of fuel source of the future. But it also means we won't see it become the next generation of nuclear weapon.

\*\*\*

Karliner and Letzter calculated the fusing of the charm quarks in the recent LHC discovery would release 12 megaelectron volts. Not bad for two itty-bitty particles.

But if we were using another pair of heavy quarks? Bottom quarks, for example? That becomes an astonishing 138 megaelectron volts.

We'd like to imagine this caused the physicists to tap wildly at their calculator screens.

Given such impressive energy output, our first reaction would be jubilation at a new way to produce copious amounts of energy from a small handful of materials. Followed by images of mushroom clouds.

But, as it turns out, neither will happen.

#### Excerpt from “No, Melting Quarks Will Never Work As An Energy Source”

Ethan Siegel, Forbes Magazine, November 8, 2017

When it comes to the ultimate dream of clean, efficient, and prolific energy sources, it's hard to do better than the secrets held within the interior of an atom. While conventional energy sources rely on chemical-based energy and the atomic/molecular transitions of electrons, nuclear energy is far more efficient. For the same amount of mass, a single atomic nucleus, either when split (for an atom like uranium) or fused together (in the case of hydrogen) can give off up to a million times the amount of energy of a combustion reaction. Recently, “melting quarks” have been discovered to be up to ten times more energy-efficient than fusion reactions. But

while fusion and fission both hold tremendous potential for revolutionizing the world’s energy, melting quarks will never work. Here’s the science of why.

The way nuclear fusion works is by taking stable, bound states of quarks (like protons, neutrons, and composite nuclei) and bringing them together under high-energy, high-density conditions. When you overcome the electrostatic force and get these charged nuclei close enough, their quantum wave functions begin to overlap, meaning there’s a finite probability that they’ll fuse into a heavier, more stable nucleus. When this occurs, a significant amount of energy is released: about 0.7% of the rest mass energy of the initial reactants. Via Einstein’s most famous equation,  $E = mc^2$ , that mass gets converted into energy, the ultimate goal of a fusion reaction.

But normal nuclear bound states, even the unstable ones, are made up of up and down quarks only, including the proton, the neutron, and every element on the periodic table. There are a myriad of other possibilities, however, since there are four other types of quark known: strange, charm, bottom, and top. We’ve even made bound state analogies to the proton and neutron with strange, charm, and bottom quarks inside. If we can fuse protons, neutrons, and other bound quark states together, perhaps we can fuse these strange, charm, and bottom “baryons” together as well. (A baryon is any combination of three quarks, bound together.)

Even though they only exist for fractions of a second, we can perform detailed calculations and simulations with these particles. We can learn exactly how they’ll behave, given that we understand the laws of physics. And in a new study, scientists Marek Karliner and Jonathan L. Rosner have demonstrated that an unprecedentedly efficient “melting quark” reaction is possible.

\*\*\*

Your mind might immediately race to unprecedented applications. “This could revolutionize our energy needs,” you might think. “This could be the most efficient weapon of all time,” the military-minded part of you says. But the truth is that these are just pipe dreams, never to be realized with any sort of practical application in the physical Universe.

Why not, you ask?

Because these particles are too unstable, and the amount of energy required to make them is far, far greater than the amount of energy you’d get out.

\*\*\*

But it cost you over 100% to make these particles in the first place! They’re also incredibly unstable, meaning they’ll decay to lighter particles on incredibly short timescales: a nanosecond or less. And, finally, when they do decay, you get 100% of your energy back, in the form of new particles and their kinetic energies. In other words, you don’t get any net energy out; you simply get out what you put in, but in a lot of different, hard-to-harness ways.

\*\*\*

It’s still an incredibly important find to learn – even via simulation – how these bound-quark systems bind together and interact with one another. It’s important to understand how binding energy works, how much energy is liberated, and what form it takes when various unstable particles react. These steps forward are an integral part of nuclear and particle physics. But melting quarks will never work as an energy source or a weapons source, as the increased efficiency over traditional nuclear fusion at these high, unstable energies is far surpassed by the 100% efficiency of matter-antimatter annihilation. If you can make particles where melting quarks is a possibility, you can also create antimatter: the most energy-efficient source in the Universe. But for cheap, abundant, clean energy, nuclear fusion, not melting quarks, is the wave of the future.

*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*  
*See Appendix TECH – Technology Progress*

*“The spaceship was ancient, yet the mysterious force of the Great Destroyer chained within the sealed coils between the hulls drove it with unthinkable speed across the star-shot darkness. The interior was close and smoky, for the only light came from oil lamps turned low to slow the fouling of the air... On the lower decks, the horses of the small party of Valkyr warriors aboard stomped the steel deck plates, impatient in their close confinement; while in the tiny bubble of glass at the very prow of the ancient vessel, two shamen of the hereditary caste of Navigators drove the pulsing starship toward a spot beyond the veil...” – Alfred Coppel, “The Rebel of Valkyr” (1950)*

**C-question:** Consider the following question: Assuming that C is constant, how did the point in space where the Earth is currently arrive before light from just after the Big Bang? Or as a Fermilab video on YouTube asks, “If the universe is only 14 billion years old, how can it be 92 billion light years wide?” There must have been a time right after the Big Bang event when the universe was expanding at faster than light speed, and thus, scientist theorize that no matter how powerful our telescopes, we will never be able to see the moment of the Big Bang. We should not be able to see farther back than about 100,000 years after the Big Bang event.

- ✓ “In the olden days of cosmology – that is, before the 1998 discovery that the universe’s expansion is accelerating – there was hope that the universe might bounce back from a ‘Big Crunch.’ In that scenario, the universe’s sheer heft would eventually cause it to stop expanding, switch gears and shift into reverse. Like a film of the Big Bang played backward, all of space would collapse to a single point. Cosmologist Stephen Hawking once speculated that time itself would switch directions during the contraction phase. (Later, after discussions with his assistant Raymond Laflamme, he changed his mind.) Today, with no end in sight for cosmic expansion, the ‘Big Crunch’ is out of fashion. But new theories are offering some hope that the heat death may not be terminal.” – Paul Halpern, “When the End is Just the Beginning: Exploring Cosmic Cycles,” NOVA Newsletter, August 12, 2014.

*“Who would once have thought that the crossing of the wide ocean was calmer and safer than of the narrow Adriatic Sea, Baltic Sea, or English Channel? Given ships or sails adapted to the breezes of heaven, there will be those who will not shrink from even that vast expanse.”*

– Translated by Edward Rosen (1965), Kepler’s Conversation with Galileo’s Sidereal Messenger (1610), p. 39<sup>1</sup>

**Breezes of the Heavens:** The European ‘advantage’ from the 15<sup>th</sup> to the 19<sup>th</sup> Century was not gunpowder, it was sailing ships. It cannot be overstated. With sailing ships and navigation, Europeans could appear anywhere, at nearly any time, on the world’s coastlines on missions of exploration, trade, slavery, colonization or war.

And they could come back again and again, as long as the will to do so existed because the world had no comparable seagoing vessels. Such was the importance of sailing warships, as the most expensive and concentrated unit of military firepower, that the Seven Years War (1756-1763) is referred to by some historians as “World War Zero.”

- ✓ Are WWI and possibly the Seven Years War, ‘world wars’ because they were fought all over the globe by European colonial powers, with minimal contributions from non-European nations and peoples, or was WWII the first ‘true world war’ because it was fought all over the globe, equally by regional and global powers, nations, and peoples from all over the globe? It depends on how the term is defined.

In science-fiction settings, *starships serve the same purpose*, serve as proxies for sailing ships in stories that usually parallel Earth history, especially the Age of Sail and Age of Exploration – from alien invasions of the Earth now, to galactic exploration, colonization, trade, war – invasion of alien planets in the future by humanity – and futuristic far-flung empires.

**Starship Jefferson:** Starship is a term generically used to indicate a spacecraft capable of interstellar flight, with a minimum speed of half-light speed, and probably at faster than light (FTL).

- ✓ The term “starship” was first used in 1882, according to Merriam-Webster online dictionary, sixteen years before H.G. Well’s War of the Worlds (which didn’t require the Martians to have starship technology) was published. In 1610, Kepler mentioned, “ships or sails adapted to the breezes of heaven” (*ut supra*).

A Starship requires at the minimum, hull capable of withstanding the forces and protecting the crew, computers, flight controls (including stopping and turning), life support, fuel, food and medical supplies, and of course, the all-important stardrive propulsion system.<sup>2</sup> Starship technology (at least in Hollywood) also tends to assume that some kind of gravitational and anti-inertial technology has been developed (to prevent the crew from being splattered against the bulkheads when the ship takes off at FTL speed), and that that pesky time-dilation problem has been overcome so that the crew doesn’t come back to find everyone on home world is dead centuries gone (it would make storytelling very difficult).

- ✓ “You might have to decide between seeing your children again and the future of the human race.” – Prof. Amelia Brand, *Interstellar* (2014).

Starships, which are often treated in such a blasé, cliché manner on television and in movies – represent the most comprehensive and concentrated form of technology available to the society, much the same as a modern nuclear powered submarine or aircraft carrier. They are marvels of intricate engineering and advanced technology, they represent the combined result of all of the Applications on the current Era Matrix.

- ✓ Conversely, in Harry Turtledove’s 1985 short story, “The Road Not Taken,” FTL – which we always assume is extremely complicated physics – turns out to be absurdly simple such that it could have been discovered by 17<sup>th</sup> Century technology. The price, however, is that technological advance of a species stops with the discovery; this is not consistent with the mainstream assumptions of GGDM, but is interesting.

They also represent the most concentrated unit of firepower, and the tenuous links that bridge the vast interstellar void, face the unknown, and hold interstellar cultures together. And like modern nuclear ballistic missile submarine commanders, starship captains hold in their hands the frightening power to destroy planets or even an entire interstellar civilization, or to protect it from enemies and aliens, and over which planetary governments have little control.

- ✓ **Shona:** Reindeer can’t fly. They just can’t. **Santa Claus:** No. No, they can’t. It’s a scientific impossibility. That is why I feed mine magic carrots. – Dr. Who, “Last Christmas” (2014).

- Assumptions of Light: GGDM requires that certain assumptions be made that would not be approved by current science. Whether we (or anything) can travel at FTL speeds is not as clearly prohibited as it seemed previously. The game must assume, *for the setting*, that reliable, repeatable FTL travel is possible. FTL is the necessary “Applied Phlebotinum” of GGDM as it is in every other interstellar ‘soft sci-fi’ setting. To wit:

- ✓ “Phlebotinum is the versatile substance that may be rubbed on anything to cause an effect needed by a plot. Examples include but are not limited to: nanotechnology, magic crystal emanations, pixie dust, and Green Rocks. In essence, it is plot fuel. Without it, the story would grind to an abrupt halt. It’s the science that powers the FTL drive on the starship so the characters can get somewhere, it’s the magic that hatches the Egg MacGuffin so the protagonist can save an endangered species, it’s the strange things unknown to science or magic that do basically anything except those limits and dangers required by the plot. The reader does not know how Phlebotinum would work and the creators hope nobody cares. According to Joss Whedon, during the DVD commentary for the pilot episode of *Buffy the Vampire Slayer*, the term ‘phlebotinum’ originates from Buffy writer (and *Angel* co-creator) David Greenwalt’s sudden outburst: ‘Don’t touch the phlebotinum!’ apropos of nothing.” – from TV Tropes.com, “Applied Phlebotinum.”

Most FTL travel in science-fiction stories assume temporal abrogation or simply ignore the time-dilation effect. However, there are some interesting exceptions here and there. In Arthur C. Clarke’s Childhood’s End, a human stows away on an Overlord ship returning to their homeworld, and returns to Earth 80 years later (our time). All of his friends, everyone he knew is either deceased, or very elderly. Having much of the same practical effect as time dilation, cold sleep or cryogenic hibernation and near light speed travel, insures that passengers and crew age little, while on their return, everyone they knew is old or dead.

- ✓ “Space is big. Really big. You just won’t believe how vastly, hugely, mind-bogglingly big it is. So big, in fact, that if Faster-Than-Light Travel is impossible it would take multiple human lifetimes to reach another star, and one way around this is you hibernate for most of the trip there. This is the Sleeper Starship. A modern variation that is becoming popular is one where the passengers just upload their brains into the ship’s computers and are downloaded into cloned bodies when they reach their destination. An older variant – a cross between a sleeper ship and a generation ship – is the ‘seed ship,’ which carries frozen embryos instead of frozen adults to save weight. The problems involved in rearing a generation of newborns without live parents are left as an exercise for the author.” – TV Tropes.com, “Sleeper Ship.”
  - Arthur C. Clark’s Songs of Distant Earth (1986) featured a ‘seed ship’ with an AI or robotic parent. See also, Wikipedia article, “Embryo space colonization.” Someday the theoretical will need to actualize.

An example of this is shown in the short-lived television series, *Earth 2*, where the young-looking pilot, who is over a century old due to cold sleep, is stranded on a frontier colony 22 light years from Earth and appears to be in mental distress over having to live on a planet and age normally. Due to cold sleep, it is unclear in the series whether they are travelling at FTL speeds. GGDM probably assumes abrogation of time dilation, but it’s not frozen in stone, and participants could experiment with time-dilation effects.

- ✓ Suppose someone invented a hibernation or stasis technology that would allow humans to sleep for decades or centuries. How would you test it? By having a person – probably a terminally ill person, unless that would cause a problem with the test – enter the hibernation unit and sleep. How long does the test need to be, do they need to sleep for decades or centuries to prove the system works? Why only one person?, you’d need a bunch just in case of medical or mechanical failure. Maybe there are people in hibernation sleep now in some deep place, just in case there was a nuclear war (yes, I played the Morrow Project RPG long ago)? Maybe sometime after 2100, a news conference will reveal that a hibernation unit experiment begun in the late 20<sup>th</sup> Century was successful, the people slept for over a century and woke up, and we can now begin putting all of humanity in hibernation ships. The movie *Magellan* (2017) unveiled stasis technology as part of the human ability to reach Saturn and beyond, but wisely never provided details, except to say that humans are not supposed to be able to dream while in stasis.

---

*“The brave explorers or colonists set out in their spaceship to spread humankind to the stars. You can’t travel faster than light, so they’re going to spend most of the trip on a Sleeper Starship as Human Popsicles, or it’s a Generation Ship and it’ll be their descendants who step out at the other end of the trip. Either way, they’re saying goodbye forever to everyone and everything they know. Decades and centuries pass, and eventually they arrive at their destination – and there’s people there waiting for them.*

*Turns out, Faster-Than-Light Travel (or at least sublight travel that is vastly faster than theirs) is possible, and it got sorted out while they were in transit. Now the same trip that took them centuries can be done and be back in time for Christmas. And that planet you were all set to colonise? Done already, and actually we’re not sure there’s any room for you... Expect the brave pioneers to be upset about this.”*

– TVTropes.com, “Lightspeed Leapfrog”<sup>3</sup>

---

**Stardrive:** In the modern era of television and big-screen space adventure, the momentary screenshot of starships taking off or accelerating, has become the visual signature of every series or movie. Nothing says you are off to escapist adventure more than a ship taking off at a mind-blurring faster-than-light speed, or passing through a bright gate into some other dimension, bound for who knows where (accompanied by loud orchestra music and drama). And increasingly, every new story with serious science-fiction pretensions has had to invent a new, visually interesting way to travel between stars and planets, such that there are now, at least a dozen different ways to take off for adventure at mind-bending (if not particularly safe) speeds burned into the memories of dedicated science-fiction fans. There are now warp drives, hyper-drives, jump gates, jump circuits, FTL drives, slipstream drives, star gates, wave engines, transwarp drives, improbability drives, gravity drives,<sup>4</sup> planar drive, foldspace, and planespace.

In most programs, the form of interstellar travel is just a visual effect, an afterthought from the special effects department, but in the rarified air of *good science-fiction writing*, the stardrive takes its proper place as a symbol or metaphor of the story and the universe in which it is set.

- ✓ For example, warp drive has become the signature of Star Trek; it probably doesn’t have any greater meaning within the Star Trek universe than simply a visual effect

and a way to get there in a blurry hurry (*ut infra*). However, slipstream travel in Andromeda – that is, travel along cortex-like quantum superstrings underlying the reality of the universe – is portrayed visually like travelling through a brain at microscopic level and may serve as a metaphor for the series (like maybe a trip through Gene Roddenberry’s brain!). Since travel between routes becomes easier the more it is done, making regular routes between colonies easy and fast, slipstream travel also resembles *neuroplasticity* (or brain plasticity); the mode of learning and retention in human brains. Seamus Harper in Andromeda said, “Slipstream is our method of going faster than the speed of light, without going faster than the speed of light.”

- ✓ In the 2016 movie *Interstellar*, the wormhole travel is important to the story, it is the place where the characters connect briefly with creatures in a higher dimension, which echoes the story overall regarding the potential of humanity.

Yet, in each program, in each universe, in each novel, there is usually only *one* efficient form of interstellar travel which is used universally by all starfaring races. In GGDM, this does not have to be true; positions are free to develop their own forms of stardrives (or try to steal others) such that multiple competing Stardrive Patents may play out in the game universe.

- ✓ Extra-dimensional travel is often the mechanism for FTL travel in science-fiction stories. People describe it as folding a piece of paper in half then punching a pen through it (this is probably the origin of the ‘folding space’ idea). But with a modern PC at my disposal, it seems that another explanation would be navigating the universe (like a document) via thumbnail view on the sidebar; you don’t have to scroll through 20 pages, you just pull down the thumbnail bar, click the page, and you are there.
- T-minus 10,000,000: A ‘real world’ theory for a ‘warp drive’ is called the Alcubierre Drive, invented in 1994 by Miguel Alcubierre, 30 years after the term was popularized in the original *Star Trek* television series.
  - ✓ “The *Star Trek* television series and films used the term ‘warp drive’ to describe their method of faster-than-light travel. Neither the Alcubierre theory, nor anything similar, existed when the series was conceived – the term ‘warp drive’ and general concept originated with John W. Campbell’s 1931 science fiction novel *Islands of Space*. Alcubierre stated in an email to William Shatner that his theory was directly inspired by the term used in the show and references the ‘warp drive of science fiction’ in his 1994 article. The 1975 *Star Trek Star Fleet Technical Manual* suggests that the essential concept is the same as that later proposed by Alcubierre.” – from Wikipedia article, “Alcubierre Drive,” captured September 5, 2019.
  - ✓ See EM Drive and Alcubierre Warp Drive excerpts, Movement, *infra*.
- Ten Million Year Leap: It seems a likely possibility that in order to travel at FTL speeds, humans would first have to become *something else* ... that the current form of humanity is not suited to interstellar travel and colonization. That is, there may be an epochal connection between *FTL travel* and *trans-human evolution*.
  - ✓ In the 2018 short story “The Lantern” by Exurb (aka, Exurb1a, available in audio on YouTube, 14 minutes), Lanterns are humans who are intentionally mutated specially to function in ‘E-space’ which human ships use in transit between the stars. In E-space, neither human minds or computers work normally, so human passengers are

cryogenically frozen and the ships are manually steered and controlled by Lanterns (they are no longer human really), who sit in the forward bubble of the ship. Lanterns can see past and future by virtue of their mutation and exposure to E-space, human interstellar culture entirely depends on them. The Lantern in the story indicates that humans will not need Lanterns in about 3,000 years.<sup>5</sup>

If any higher SQ (Sentience Quotient) extraterrestrial (in our dimension) or extradimensional intelligences are watching, the invention of technology allowing faster-than-light travel by humans would be comparable to the spontaneous invention of an internal combustion engine by a toddler. Or by someone from the year 1066 A.D. It is not impossible, it is just extremely, in the most extreme sense, unlikely. Perhaps a once in a ten-million year leap outside the potential energy well, a temporal alpha decay. Carl Sagan pointed out:

- ✓ “It is all a matter of time scale. An event that would be unthinkable in a hundred years may be inevitable in a hundred million.” (*Cosmos*, p. 73).<sup>6</sup>

And the universe is over 13 billion years old, the sun over 4 billion years. The universe is vast, how many interstellar civilizations are out there? Well, that depends on who you ask and how the Drake equations are modified and what assumptions are made,<sup>7</sup> see *Primal States*, and EN 2, 6 *Beginnings*, pp. 61, 67 respectively, *supra*.

If humans invented stardrive anytime in the next million years – that would be about two million years after human predecessors began using (not making) fire – we’d likely be well ahead of the probability curve.

- ✓ Standing in 2019: We consider the events of 2000 years ago to be ancient history; in the West, in the year 19, the Roman Empire, just transformed from the Roman Republic two generations prior, was approaching its zenith, Augustus Caesar had died five years prior, Roman expansion had been stopped at the Battle of Teutoburg Forest ten years prior. And the 19 year old Jesus was wandering around Roman Palestine. Ten thousand years ago is the dim twilight of history which we know with fair certainty, and much of that comes from archeology rather than contemporary recorded history. If it takes another 10,000 years for humanity to invent stardrive, and reach what GGDM calls the 1<sup>st</sup> Era of interstellar culture, what will our time seem like to those people, wherever they happen to be living in the solar system?
- Trans-human Touchdown: Kate Becker may have inadvertently suggested a path for human epochal evolution in her July 28, 2014 article, “Is Quantum Intuition Possible?” on NOVA discussing how babies learn intuitively the physics of our world:
  - ✓ “These innate notions, plus ‘elaborations’ born from watching and interacting with the world, add up to a sort of ‘naïve physics’ that we all grasp without any formal physics training, says [Kristy] vanMarle [University of Missouri]. But what about building quantum intuition after that early mental groundwork has already been laid?”

Of necessity it must also be true that any animal, especially of the higher orders, obtains “a sort of ‘naïve physics’” of the world in which they live, especially predators and their prey. This must be the co-defining mark of ‘progress’ or increasing neural complexity along both the sentience and sapience axes (plural of axis). Viewed in this way, it is remarkable that humans have only in the last four centuries passed beyond “a sort of ‘naïve physics’” as a spe-

cies, noting though that ancients had impressive engineering skills and used projectile weapons, such as catapults, and so possessed visionary application of “a sort of ‘naïve physics.’” It is now the place of humanity that we have arrived after the sudden spurt of formalized understanding able to imagine the quantum world, though having some trouble framing it.

- ✓ Continuing, she states, “To get from Aristotle to Newton, you have to be able to imagine a world without friction. Luckily, that isn’t so hard; if you’ve ever played air hockey or laced up ice skates, you can vouch for Newton’s first law. But what is the quantum equivalent of an air hockey table – an everyday object that provides us hands-on access to quantum physics?” *Id.*

- See full feature quote, 4 Colleges, p. 505, *supra*.

Thus, one might expect an epochal transformation of humanity – and no one can possibly predict the ramifications across our civilization, it would be as profound as reproductive consciousness or learning to make fire – when humans gain an intuitive understanding of the quantum in the same way we play air-hockey or intuitively understand the Classical Physics from the time we were infants. This is not at all impossible, as Albert Einstein hinted at the Bad-Nauheim debate in 1920 while dismissing illustrativeness in physics:

- ✓ “I would like to say, that what humans consider as illustrative or not, has changed. The view about illustrativeness is so to speak a function of time. I’m of the opinion, that physics is conceptual, not illustrative. As an example for the changing view about illustrativeness, I remind you of the view on illustrativeness of Galilean mechanics in different periods.” – Albert Einstein, Bad Nauheim Debate (1920).
- ✓ See further, Peek-a-Boo discussion, 2 Expansion, p. 893, *infra* and also human intuition discussion in You Already Knew It, 4 Colleges, p. 505, *supra*.

It would be interesting to see truly post-transhuman fiction (other than Frederik Pohl’s classic New Wave short story, “Day Million”) that describes the universe of human descendants who would legitimately regard us as Australopithecus (or babies). It is difficult to describe such a world, it would be like a blind-from-birth man describing seeing. The closest I have seen to this concept are the Therians’ “hyperlife” from the game AT-43, and the Mindjammer RPG setting, the New Commonality of Humankind (Mindjammer and Eclipse Phase were groundbreaking trans-human RPGs). GGDM does not address this epochal transformation; instead taking the convenient, well-trodden paths of standard science-fiction trope.

- Humans Advance Swiftly: To avoid addressing the epochal transformation or millions of years of sublight travel, and to keep the story accessible to the audience, science-fiction writers usually take the highly unlikely ‘temporal alpha decay’ above to give humans FTL. This is evident in the Stargate SG-1 series where an advanced alien visitor insisted that humans (with late 1980s early 1990s technology) could not have learned to operate the Stargate on their own, it is also the backbone of Star Trek, e.g., Cochran’s invention of the Warp Drive, and dozens of (in fact, nearly all other) science-fiction stories involving humans, technological alien civilizations and interstellar civilization. This also provides the credible intellectual basis for human adventurers to radically upset the existing galactic order, become a threat to the universe, and prove more dangerous and intelligent than all other races combined.

- ✓ “For every species bar one, Medieval Stasis is how the world works. Changes in technology and society take hundreds of years, and any existing alien civilization or

elf kingdom today looks more or less the same as it did a century ago – or will in a century more. For most races in the setting, slow change is the norm. The great exception are humans. Somehow these talking plains apes, who have only learned to walk fully upright a few hundred thousand years ago, have mastered technology and civilization in a fraction of the time it took everyone else, despite their incredibly short individual lifespans. Or maybe it is that very brevity that drives humans, the sense that they don't have decades to spare and need to accomplish things now. Or the rapid generational turnover means that once we become set in our ways we don't last long enough to impose our views on successors still young enough to be open-minded to new ideas.” – TV Tropes.com article, “Humans Advance Swiftly.”

All of this is a continuation of the “European mania for tinkering” (see David Landes excerpt, Eras, *supra*) and exploration that became science, technology and expresses itself in science-fiction colonization.<sup>8</sup> It is not surprising then that science-fiction literature not do well outside the West, with the exception of Japan, because Western science-fiction genre does not have a basis in their cultures. Many thus see science-fiction genre as a continued form of racism and/or global enculturation of European ideals, with the stories and settings replaying 17<sup>th</sup>-19<sup>th</sup> Century European exploration, colonialism, and East-West relations and Western-African relations. In this milieu, Japan occupies a peculiar place, a continued legacy of the Meiji Restoration program, it has embraced Western science, technology and business-manufacturing ideas (and science-fiction), a secular government was imposed after WWII, but remains otherwise, culturally xenophobic and suspicious of foreigners and foreign ideas, and remains one the most racially and ethnically homogenous populations on Earth.

- ✓ I have read somewhere in a news article, an allegation that Japan is one of the last major nations on Earth that has not addressed racism, and this is because of the factors outlined above.

---

*“Nor did science fiction’s refusal to champion a collective prescription for a space program vitiate its successful social role as a major spiritual and even mystical inspiration for Project Apollo. For while science fiction never did predict the details of Project Apollo, let alone champion anything so apparently ludicrous as going to the Moon via brute-force rocketry directly from the surface of the Earth without building an orbital space station first, many were the astronauts and space scientists whose careers were set in motion by its multiple visions of space-faring futures.”*

– Norman Spinrad, [Science Fiction in the Real World](#) (1990), p. 124

---

**Starship Scale:** Undoubtedly, most participants of this game will envision human-scale starships – the kind usually featured in science-fiction movies and television programs. Such ships approximate the size of the largest oceangoing tankers on Earth, with some variation. At that size, such ships could presumably land on a planet surface without too much disruption, if built for atmospheric entry and landing. *Most Starships in GGDM are not assumed to be able to land on planets.*

Human imaginations are limited by first, our body size, and second, by our appreciation of the resources available *on Earth* currently, and consequently, a general lack of understanding of the

resources available in space (the metallic asteroid Psyche 16 is but a pittance) and the exponential power of future advances in manufacturing, and manufacturing in space.

- ✓ I recall a quote in a hypothetical starship discussion, which I cannot now place, that ‘a starship will only be as big as it needs to be’ on the theory that resources to build are scarce (and no need to create extra maintenance problems either). This must be embedded in sci-fi lore somewhere because I have seen various examples of starships scaled to creatures that are larger than a human or in the case of the First Contact short story “Meteor” (1956) by John Wyndham, much smaller. It *could be* a sign of Cosmic Impracticality (see 3 Entropy, p. 248, *supra*) to build monumental vessels that exceed the size of the species (like the 100 ft. tall Egyptian temple columns), in fact, the Goa’uld ships in Stargate SG-1 are fittingly built like Egyptian temples.

Examples of enormous (by our standards) starships are of course, the moon-sized Death Stars in Star Wars, SDF Macross (more than a kilometer long, but much less than a mile long, more than twice the size of the world’s largest tanker), the Magogg World Ship that consisted of 20 planets joined around an artificial star, armed with swarm ships and a weapon firing mini-black holes,<sup>9</sup> and also the solar-system-sized ship which Galactus encountered in the last issue of Epic Magazine:<sup>10</sup> Galactus was flying through the interior of the ship at the speed of light or more!<sup>11</sup> Like a housefly. And all of them are but a bubble of metal and air in the galactic or cosmic space; if you have ever been out in the middle of the Pacific Ocean on a ship, you will understand.

- ✓ The Space Battleship Yamato in Star Blazers (1979-1984) is exactly the size of a very large WWII era battleship – because it is the resurrected, refitted, refurbished IJN Yamato that was sunk April 1945. Who’d have thunk it? Set in the year 2199, the Yamato has been laying at the bottom of the ocean for 254 years (needs cleaning)... in the animated series I watched as a teen, the oceans have dried up exposing the ship, but the live action movie trailer (2010) shows the ship rising from the deep ocean with massive fighter escorts, and effortlessly making a vertical climb to orbit.<sup>12</sup>
- ✓ Though I cannot remember the sources now, I recall seeing something about a starship constructed from the mass of three galaxies (way beyond the scope of GGDM) and another, probably anime, series featuring ‘system cruisers’ which could hit any planet or ship in a nearby starsystem without moving (the point of this was that extreme long range weaponry changed the military dynamics, balance of power).

Ship sizes may be limited in Star Drive systems that are or require physical jump gates, such as those in the Buck Rogers and Babylon 5 television series. The corny Buck Rogers television series in 1979-1980 used the term ‘stargate’ for their local Earth Federation warp-point, which predates the 1994 movie of the same name. Babylon 5 featured both Jump Gates – technology that the humans got from contact with the Centauri who probably got the technology from elsewhere – and certain very powerful warships that could open their own jump points to and from hyperspace without a Gate. Babylon 5 is perhaps a little inconsistent on this point, but in the Babylon 5 movie, “Thirdspace,” they mention having to “widen the struts” on the Jump Gate to drag an enormous alien artifact through that they found adrift in hyperspace, indicating that there are ship size limits for the Jump Gates.

- ✓ However, stargate size may not limit starship size if it assumed that the ship shrinks or compresses when entering or being accelerated through the gate. This seemed

have been implied in the 2010 German indie sci-fi movie *Nydenion* when the enormous battleship emerged through the stargate. This could be the difference between ships of different Eras using the same Stardrive Patent.

*“Beneath all this gaiety and baroque complexity lay the simple and so carefully denied: beyond the thin metal surrounding us was the endless humourless void. Hollow rings the laughter of orphans in the night.”*

– Norman Spinrad, *The Void Captain’s Tale* (1982), pp. 167-168, Kindle Ed.

**Stardrive Patent:** A Stardrive is not a Physical Item Technology (PIT) because it is not a ship or installation, rather it is part of a ship.

- ✓ A Stardrive might in some cases, approach the status of a Technological Device (TD), for example, if some limitation of one Stardrive per system were in place, however, Stardrives (however expensive) are generally meant to be mass manufactured and more common than singular Technological Devices (if there were only one Stardrive in existence, it might be a Technological Device, but in space opera that is not likely).
- ✓ A Stardrive is not an Enhancement Technology, you cannot just strap one on the back of the space shuttle and fly to Alpha Centuri and then discard it.
- ✓ And a Stardrive is not a Continuous Operational Technology, because it is far from a ‘minor’ upgrade to an existing system.

A Stardrive is special, it is the core technology of interstellar culture – a propulsion system capable of moving living creatures and cargo to other stars in an efficient and timely manner (relatively speaking☺) and returning. Therefore, Stardrives are defined in the game by use of a special type of Patent, the Stardrive Patent.<sup>13</sup>

- ✓ The stardrive is the essence of the starship, without it, you have a spaceship (or system boat or maybe ‘fighter’). Stardrive is the *thing* of space-opera fiction. Perhaps it is too much of a metaphorical stretch, but would a Patent on fire have fit any of the Patent types? Fire was the *thing* of ur-civilization; humans made it a god (like a stardrive). The Patent process in GGDM is, of course, deeply flawed when compared to the real world, but it works for the in-game purpose for which it was designed.
- **Exclusion Principle:** While a position or a game may have many different Stardrive types (Stardrive Patents), each ship may have only one type of interstellar propulsion system and must be constructed with that drive system. Additionally, it will generally be prohibited for ships to be refitted with new types of Stardrives (when and if it is allowed, expect the cost to be quite high) and each ship may only have one unit of any type of Stardrive, both for eminently practical economic reasons. The basic assumption then in setting the cost of building any type of ship is that it will have only one Stardrive type and only one Stardrive unit (i.e., no stardrive redundancy), which is an integral and inseparable part of the ship and is built as the core of the ship at the time of construction. Carefully limited, very expensive, exceptions to these rules may be allowed by the Concierge.
  - ✓ “The [Pauli] Exclusion Principle is laid down purely for the benefit of the electrons themselves, who might be corrupted (and become dragons or demons) if allowed to associate too freely.” – Alan Turing (1954).

- And One Moving Violation: Positions are limited to successful prosecution of one Stardrive Patent per Era, except in the 1<sup>st</sup> Era *if* Generic Stardrive (GSD) was not acquired during the game setup process. Stardrive Patents may only be prosecuted in the current Era Matrix.

The GSD is required (as it is an Existential Patent, see Event Horizon 1 Eras, p. 760, *supra*) to progress to the 2<sup>nd</sup> Era, but does not exclude prosecution of another Stardrive Patent in the 1<sup>st</sup> Era. Thus, a 1<sup>st</sup> Era position could prosecute two Stardrive Patents, if it started the game without GSD, which would be an arduous task in the early game. Only one successful Stardrive Patent is required to advance to the 2<sup>nd</sup> Era, however. Stardrive Patents are not available as Advanced Patents, see 1 Eras, p. 763, *supra*.

*“...it is the duty of the conscientious science fiction writer not to falsify what he believes to be known fact. It is an even more important function for him to suggest new paradigms, by suggesting to the reader, over and over again, that X, Y, and Z are possible. Every time a story appears with a faster-than-light drive, it expresses somebody’s faith – maybe not the writer’s; but certainly many of the readers’ – that such a thing may be accomplishable, and some day will be accomplished. Well, we have a lot of hardware – including, I’m sorry to say, a couple of old beer cans – on the moon right now, to show us what can be done with repeated suggestion. I think it can be done philosophically on a far broader scale than we have ever managed to do before.”*

– James Blish, The Tale that Wags the God (1987) (Kindle Loc. 620-626) <sup>14</sup>

## Endnotes.

<sup>1</sup> Citation: See full feature quote, 2 The Sidereal Stage, bottom p. 120, *supra*.

<sup>2</sup> Commentary: The 1970s board game, Starfall, had an interesting FTL system; ships were divided into Pi ( $\pi$ ) Ships and Infinity ( $\infty$ ) Ships. Pi Ships were attuned to local space and could move only within their sectors, while Infinity Ships were very expensive but could transit from sector to sector via wormholes (i.e. “starfall”). Exploration in the game was tedious, basically finding a wormhole, seeing where it came out, then mapping the entire sector looking for good planets. The 2011 board game, Eclipse also uses wormholes to connect the sectors, but all ships can travel via wormhole, and the way the sectors are laid out in rings doesn’t give a visual impression of wormhole connection.

<sup>3</sup> Citation: In GGDM, this is called Maximum Habitability, see Dayworld, 3 Taxation & Census, p. 315, *supra*.

<sup>4</sup> Commentary: Many movies that received bad reviews seemed like fine movies to me; many movies that receive awful reviews from the critics are positively received by the audience. Thus it is with Event Horizon (1997), which received awful reviews. There are probably two kinds of audiences, the horror/shock/gore audience and the sci-fi audience. I don’t watch movies to be shocked, scared or grossed out, so as a sci-fi fan, I thought Event Horizon was a good movie, I don’t mind adding a little horror to sci-fi films, but more gore would have made Event Horizon less appealing to me. The 30 minutes of lost footage would not have improved it.

<sup>5</sup> Commentary: The story is derivative of Alfred Koppel’s “Rebel of Valkyr” (1950), the movie Arrival (2016), the Navigator Guild in Dune (1965), and the Void Pilots in Norman Spinrad’s Second Starfaring Age books (1983-1985). However it weaves the elements together in a convincing way presenting a new whole.

- ✓ *Spoiler alert*, I guess. Exurb1a does however leave an open question at the end: The Lantern admits that the futures he can see are probable, which then rules out pre-destiny – if there is a range of possibilities, there is no pre-destiny, you are on a road instead of a set of rails. Yet, he has gone back in time to recruit his past self to become the Lantern that he is in the future and seems to treat it as pre-destined. If he fails, if his past self chooses the other possible future, a paradox is created. On a personal level, it is non-harmful because it simply means the Lantern was never there to recruit himself – except (possibly) in the memory

of his past self who made a different choice (but if he wasn't ever there, is there a memory of it?). But to the human interstellar civilization, what about the potentially hundreds of transits he piloted that are now changed or un-happened? Which makes the reader wonder why Lanterns are allowed to go back and recruit their past selves? Yet, the Lantern describes it as a ritual of the Lanterns? As if they must finally prove to themselves that they were always going to become Lanterns? Like Mel Gibson going back in time to his own youth to convince himself that he was always going to be Mad Max?

<sup>6</sup> Commentary & Citation: That is, unless FTL is actually, literally impossible... “But given infinite time, any non-impossible arrangement will happen.” – Matt O’Dowd (City University of New York), “Are You a Boltzmann Brain,” PBS Space-Time Channel, April 26, 2017. But what we understand right now doesn’t make it impossible.

<sup>7</sup> Citation: A. Frank, W.T. Sullivan III, “A New Empirical Constraint on the Prevalence of Technological Species in the Universe,” *Astrobiology*, Vol. 16, No. 5, May 2016.

<sup>8</sup> Citation & Commentary: The Chinese, of course, have their own word for ‘tinkering’:

- ✓ “Shanzhaiism (山寨主義) is a philosophical term denoting a Chinese style of innovation with a peasant mind-set. Shanzhaiism has an equivalent English term: tinker.” – from Wikipedia article, “Shanzhai,” January 25, 2019. The idea morphed into the term for counterfeit products: Shanzhai Products. “However, with shanzhaiism in mind, people can produce fake and counterfeit products in a massively organized way.” *Id.*
- ✓ In most civilizations of the past, foreigners were classless outsiders, troublemakers and often in status, lower than the peasants upon which the civilization depended for food, labor and military power. Shanzhai can also mean bandits: “Literally ‘mountain village’ or ‘mountain stronghold,’ the term refers to the mountain stockades of regional warlords or bandits, far away from official control.” *Id.*
- ✓ It is thus not a great extension that in China (e.g., ‘shanzhaiism’), tinkering was something peasants did naturally but the upper classes avoided. This played into their early perception of the “European mania for tinkering” (David Landes excerpt, Eras, *supra*) as the Europeans were outsiders, below peasants in status.
- ✓ Further, the Europeans created strongholds along the coast line of China and other places, and were often thought of as bandits and outside of official control. Thus, the entire early Chinese perception of Europeans possibly can be described in this one term.

<sup>9</sup> Citation: Andromeda television series, generally.

<sup>10</sup> Citation: Epic Illustrated, #34, February 1986, “The Last Galactus, Chapter 9.”

<sup>11</sup> Commentary: Consider that it takes light 8 minutes to reach the Earth from the Sun; Galactus found Nova inside the ship shortly after explosively breaching the hull.

<sup>12</sup> Citation: “Star Blazers The Movie – Teaser Trailer” (1:17) published on YouTube, July 27, 2010, has 1.6M views as of December 2016, including a few from me.☺

<sup>13</sup> Commentary: Need jumpdrive? Strap a couple of lemmings to your starship... Sorry, you cannot un-read this!☺

<sup>14</sup> Citation: “...here is a rough (and only partial) inventory of the stuff mankind has left on the moon: more than 70 spacecraft, including rovers, modules, and crashed orbiters, 5 American flags, 2 golf balls, 12 pairs of boots, TV cameras, film magazines, 96 bags of urine, feces, and vomit, numerous Hasselbad cameras and accessories, several improvised javelins, various hammers, tongs, rakes, and shovels, backpacks, insulating blankets, utility towels, used wet wipes, personal hygiene kits, empty packages of space food, a photograph of Apollo 16 astronaut Charles Duke’s family, a feather from Baggin, the Air Force Academy’s mascot falcon, used to conduct Apollo 15’s famous ‘hammer-feather drop’ experiment, a small aluminum sculpture, a tribute to the American and Soviet ‘fallen astronauts’ who died in the space race – left by the crew of Apollo 15, a patch from the never-launched Apollo 1 mission, which ended prematurely when flames engulfed the command module during a 1967 training exercise, killing three U.S. astronauts, a small silicon disk bearing goodwill messages from 73 world leaders, and left on the moon by the crew of Apollo 11, a silver pin, left by Apollo 12 astronaut Alan Bean, a medal honoring Soviet cosmonauts Vladimir Komarov and Yuri Gagarin, a cast golden olive branch left by the crew of Apollo 11.... One other earthly object that resides on that landscape is an urn containing the ashes of Eugene Shoemaker, the famed planetary geologist who dreamed, during his life, of going to the moon.” – Megan Garber, “The Trash We’ve Left on the Moon,” *The Atlantic*, December 19, 2012.

*See Appendix EPAT2 – Existential Patents Quick Summary*  
*See Appendix TECH – Technology Progress*

*“One by one, the amber ready points lit up before me as Mori scurried along the bank of monitors rimming the curving front wall of the bridge. As she scrambled back and forth before the chest-high monitors, her eyes fixed on her instruments as she chanted her part in the ritual, I understood for the first time ... that these consoles had been so arranged as a piece of psychic engineering. After all, they could more conveniently have been heaped up around the Man Jack’s chaise; there was no purely functional need to string them out along the curve of the bridge’s ‘bow’ like a retaining wall. Indeed, this was an inefficient arrangement that forced the poor Man Jack to hop about from one to the other like a slavey.*

*But without this curved retaining wall of instruments, this fence between us and the lip of the abyss, this foredeck railing, if you will, the three of us would have been vertiginously planted on the bridge deck surrounded by a sea of stars with nothing to keep a random breeze or a fumblefooted stumble from spilling us over the edge into the infinite void. Naturellement, in reality the starry sea was but a colour-corrected tele image; we were not on an open deck but in an enclosed capsule, and there were no galactic breezes or waves about to sweep us away. The mind understood this, but now, close on to the first Jump, with no projected manoeuvring grid to fracture the totality of the illusion, the spirit could begin to wonder.”*

– Norman Spinrad, *The Void Captain’s Tale* (1982), pp. 59-61

**Generic Stardrive (GSD):** The Generic Stardrive is the **only** interstellar propulsion system available as an Existential Patent.<sup>1</sup> Positions are not required to purchase the GSD during set up, *unless required by their chosen Primal State*, but in most cases, it would be a very wise choice, not the least, because ships (even Scout Ships) cannot be built without it.

- ✓ “The Centauris didn’t exactly invent jump gate technology either. None of the current races did. They found the gates when they got out into space, took them apart and put them back together again. No one even knows who built the first gate.” – Bill Morishi, *Babylon 5, Thirdspace* (1998).

GGDM assumes generally that all of the Major Races independently invented Stardrive technology, however, since all positions begin with Generic Stardrive Existential Patent, it is possible that all of the Major Races received or found alien technology before the game. This is a possible interesting starting point for a story, a mystery for the game to resolve.

- ✓ See Event Horizon, 1 Eras, p. 760, *supra*, regarding requirements to exit the 1<sup>st</sup> Era of Technology.
- **Dynamic Interactions:** The choice of Primal State is very strongly related to the GSD. This is a place where the min-max approach of Euro board gaming is most useful in GGDM. Participants can determine how many Inheritance Points (IPs) will be received from their Fundamental Reality choices and then calculate various combinations based on the six Primal States available, taking into account the cost of GSD and other requirements, the Government Titles they have chosen, and their preferred style of play. This is spreadsheet country.
  - ✓ Ship Speed has a dynamic interaction with several other parts of the game, e.g., colonization, defense, commerce, Operational Flight Limitations (OFL) and Operational Supply Limitations (OSL) (see 3 Movement, pp. 855-856, *infra*), and some Conflict

Checks for Government Titles (see Starch & Parchment, 3 Government Titles, p. 613, *supra*). Maybe GSD stands for Game Systems Dynamics?

- Dog Star: The GSD is the prototype Stardrive Patent. The base speed for GSD is a painfully slow two per Regular Turn, with movement distance being calculated as indicated on the Stardrive Patent. This is what is referred to in the game as “ship speed,” the maximum speed at which ships move between coordinates (see FTL Missile, 2 Movement, p. 849, *infra*). The GSD ship speed may be increased in *increments of one* by use of COT (Continuous Operational Technology) Patents based on the GSD Stardrive Patent. A maximum increase of one ship speed is allowed per COT Patent of the GSD.

Page | 792

Like Stardrive Patent prosecution (*ut infra*<sup>2</sup>), the COT Patents (and ET Patents) based on the GSD Stardrive Patent do not require the listing of Applications or the establishment of connections on the current Era Matrix, rather, the success of each prosecution of a COT Patent to improve the Ship Speed of the GSD Drive will be determined by a single ten sided die roll, whose result must be *less than or equal to* the absolute value of current Ship Speed minus ten to be successful. A die roll result of ‘0’ is interpreted as 0 and not 10, so that the range of numbers is 0-9.

- ✓ For example, the current Ship Speed for the GSD is 2 per turn, a ten sided die is rolled for a COT Patent to improve Ship Speed. Any result of 8 (2 minus 10 = -8, the absolute value of which is 8) or less will be a successful prosecution of the COT Patent to increase Ship Speed by one increment to 3. Increases in Ship Speed for the GSD Patent will become more difficult as Ship Speed increases, until finally, at Ship Speed 10, it can only be increased on a roll result of 0 (i.e. less than or equal to 0).

The use of absolute value in this equation makes an interesting flip situation when GSD Ship Speed reaches 11, as the absolute value of 11 minus 10 is 1 and each increment thereafter gets easier. But that requires a large number of Power Activations (roughly, I’d estimate about 20-25, late middle to end game) due to the maximum increase of one Ship Speed increment per COT and each increment after 11, even when nearly guaranteed of success, still uses a precious Power Activation each turn. The maximum Ship Speed of GSD is infinite, requiring at some later point, only a Power Activation to increase speed (plus the energy content of an entire universe!), unless the Concierge wants to cap the top speed.

These rules specifically and only apply to increasing Ship Speed of the Generic Stardrive Patent and are a general guideline for other subsequent Stardrive Patents. However, the game is not bound by these rules beyond the GSD and the participants are free to experiment; for example, a new Stardrive might be developed that has a good initial ship speed that can never be increased until late in the 3<sup>rd</sup> Era. There are many other possibilities.

- ✓ There are many different ways the GSD equation could be formatted that will change the way the game plays (e.g., *greater than or equal to* ten minus the current Ship Speed), making progression harder in the beginning and easier later.
- Spindizzy: While Generic Stardrive is an Existential Patent, the COT to increase Ship Speed is not (extensions of Existential Patents are not Existential Patents), therefore there is no requirement to increase Ship Speed of GSD to progress from the 1<sup>st</sup> Era.
  - ✓ Positions could continue to use GSD during the entire game, as it satisfies the 1<sup>st</sup> Era Progression requirement (see 1 Eras, *supra*), as long as they do not desire to progress

to the 3<sup>rd</sup> Era. GSD COT ship speed Patents could contribute greatly to Advanced Patent prosecution by increasing the number of completed Patents in an Era. Of course, there are tradeoffs to this way.

The underlying assumption in the use of COT to increase Ship Speed for the GSD is that the process of increasing Ship Speed is something like fine tuning (e.g., extending the known value of  $\pi$  into trillions of numbers past the decimal or increasing the efficiency of quantum entanglement transfer in decimals beyond 99% in quantum computers) and/or adding greater energy input/throughput to the drive (or maybe something like the explosive progression of bus and clock speed in PCs). The Concierge is free to require permanent upgrade Enhancement Technology Patents (ETs) or temporary, expendable booster ETs instead to increase Ship Speed and impose a per jump or per increase cost per ship. This would serve to limit the number of ships a position would build knowing that increase in Ship Speed comes at great RP cost across the fleet.

- ✓ “The Dillon-Wagoner Graviton Polarity Generator, known colloquially as the spindizzy, is a fictitious anti-gravity device imagined by James Blish for his series *Cities in Flight*. ... According to the stories, the spindizzy is based on principles contained in an equation coined by P.M.S. Blackett, a British physicist of the mid-20<sup>th</sup> century. ... Blackett’s original formula was an attempt to correlate the known magnetic fields of large rotating bodies, such as the Sun, Earth, and a star in Cygnus whose field had been measured indirectly. It was unusual in that it brought Isaac Newton’s gravitational constant and Coulomb’s constant together, the one governing forces between masses, the other governing forces between electric charges. ... Blish’s extrapolation was that if rotation combined with mass produces magnetism via gravity, then rotation and magnetism could produce anti-gravity. The field created by a spindizzy is described as altering the magnetic moment of any atom within its influence.” – from Wikipedia article, “Spindizzy,” captured September 20, 2019.
- **Brown Star:** Positions that chose not to, or are unable to acquire the GSD Stardrive Patent during the game set up, have three options: try to develop the GSD Stardrive early in the game, try to develop a new Stardrive Patent, or stay home. In-game prosecution of the GSD Stardrive Patent is processed in the same way as the prosecution of any other Stardrive Patent (*ut infra*). The GSD is only available as an Existential Patent either during set up or in the 1<sup>st</sup> Era (by operation of the rules for Era progression, see Event Horizon, 1 Eras, p. 760, *supra*).

---

*“‘Please do not be alarmed,’ it said, ‘by anything you see or hear around you... We are now cruising at a level of two to the power of two hundred and seventy-six thousand to one against and falling, and we will be restoring normality just as soon as we are sure what is normal anyway. Thank you...’*

*Ford was wildly excited. ‘Arthur!’ he said, ‘this is fantastic! We’ve been picked up by a ship powered by the Infinite Improbability Drive!’”*

– Douglas Adams, the [Hitchhiker’s Guide to the Galaxy](#) (1979)

---

**Starrider:** A Stardrive Patent is constructed differently than a normal Patent; most importantly, a Stardrive Patent does not depend directly upon and does not list specific Applications. However, like other Patents, the Stardrive Patent must contain sufficient information so as to be playable and balanced within the game. A Stardrive Patent must have the following parts:

- What's in a Name: A Stardrive type must have a name (e.g., warp drive, wave engine, shaft drive, put-putt drive, etc.) that is somehow related to or indicative of its operational theory. The GSD ('generic') drive is so named because it lacks an operational principle; it could have been called the Dumb Drive, but GSD sounded better.
  - ✓ "Shaft Drive" is the opening hard-edged electric guitar theme from the sci-fi anime series *Gene Shaft* (2001). Guitar aficionados should treat themselves to this shred feast by Akira Takasaki and Ji-Zo.
- How it Moves: The Stardrive must contain a section with information sufficient for the Concierge to be able to calculate the movement rate (i.e. speed, distance) for ships using the new Stardrive (see *FTL Missile, 2 Movement, p. 849, infra*) Any formulas must be repeatable and understandable by all involved, and may require the functions of a regular calculator.
  - ✓ For example, the Andromeda Wiki article, "Slipstream" gives the following: "Simple formula for slipstream navigation:  $i=1-(\Omega^2/r^3)$ ." That's not simple to me, the math simpleton, and I haven't the slightest idea what it does or means. I also have no idea if it has a connection to the real world or is made up gibberish.
  - ✓ I once played in a free PBEM game called *Darkness of Silverfall* where the entire playing area was being sucked into a black hole; planets and ships would move a certain distance toward the black hole each turn. Some math-smart players had a formula to determine the end X, Y, Z coordinates of any object after pull toward the black hole. I didn't understand the math, but I could work the formula on a calculator and it was demonstratively correct. Stardrive movement formulas are limited by the math understanding and calculators of the participants.

Remember that GGDM does not entertain any specific measure of time or distance in real terms, but that all distance and movement in this game are considered only in three-dimensional coordinates of start and destination stars, and turns required to travel between the stars (i.e. fourth dimension).

Distance is therefore, really time measure; distance in space is both mind-boggling and meaningless at the same instant. Ship speed in GGDM, in which the time represented by a Regular Turn is indeterminate (see *4 The Streams of Time, p. 101, supra*) necessarily includes and assumes time for deceleration and in-system maneuvering – details that the game does not look at – such that the result is a single, simple game number called Ship Speed.

- Blurry Hurry!: Based on the formulas given in the previous section, the Stardrive Patent must establish an initial speed for ships using this Stardrive system. Of course, ship speed may be improved gradually through the use of COT or ET Patents based on the Stardrive Patent. The initial base ship speed should be painfully slow for 1<sup>st</sup> Era Stardrive Patents, somewhat faster for 2<sup>nd</sup> Era Stardrive Patents, and perhaps moderate for 3<sup>rd</sup> Era Stardrive Patents. Unless it would be interesting to do otherwise...

- ✓ Stardrive Patent prosecution in the 2<sup>nd</sup> and 3<sup>rd</sup> Eras *may* be able to take advantage of the Uber Alles for those Eras if constructed properly, giving them unimagined powers. See 2 Eras generally, *supra*.
- Operational Characteristics Wanted: This section should contain any additional operational characteristics not found in the previous sections, and especially, those describing limitations on the performance or operation of this particular Stardrive (e.g., “Disturbulence Modifiers,” 2 Movement, p. 846, *infra*). As a matter of balancing principle, a Stardrive Patent will not be allowed that doesn’t describe some reasonable limitations on the operation of the Stardrive and/or some unique characteristics of the Stardrive system. Stardrives should not be allowed which are capable of instant unlimited speeds (unless it would be interesting and costly...).
  - ✓ Google search reveals that the question of continuous or infinite acceleration of spaceships is a common topic of discussion. Newton’s Laws and what we call common sense suggests that there is no limit to acceleration as long as thrust is supplied and nothing impedes it; but then there is Special Relativity and all the modern, complex discussions that suggest a spaceship cannot have infinite acceleration and that it will never reach the speed of light in any case. Well, the necessary assumption of FTL drives has already tossed that latter point aside; who knows what physics rule the Stardrives in GGDM? Thus they can only be described in game operational terms.
- User Manual: Stop me if you’ve read this before.... As with other Patents, there will be a section for the Concierge to insert rulings and operational notes on the Stardrive Patent as the game progresses and those rulings become necessary. As before, rulings will only be made when necessary, leaving all else undefined until a situation arises where the Concierge must decide, and no advance rulings will be given.
- Stimmung: Stimmung is a German word that translates as “mood.”<sup>3</sup> The Stardrive Patent should contain a loose statement indicating the spirit and/or worldview symbolizing or identifying with the operational principles of the Stardrive. This is more in the spirit of good science-fiction literature than game requirement, and players should not regard this as an adversarial situation where the Concierge is going to ‘use’ this statement ‘against’ the position. The *stimmung* is also not an official Interpretation and cannot be used for that purpose.

---

*“Yes but we can’t repair the Wave Motion Gun. It was too badly damaged when we rammed into Desslok’s ship. It will take weeks to get it repaired properly.” – Sandor, Star Blazers (animated series)*

\*\*\*

*“Ready Wave Motion Engines. As soon as we surface – we attack!”*

– Derek Wildstar, Star Blazers (animated series)<sup>4</sup>

---

**The Cool Ship**: When the Queen of Iscandar provided plans for the Wave Motion Engine so that we could voyage to their planet, they never expected humans to engineer it into a massive beam weapon.

- ✓ **Space-Opera Alert**: Alien interstellar, technological civilization with two biological sexes, fully human appearance, and a *monarch*. See discussions of governments in space opera, see Kings, Queens, and Guillotines, 3 Government Titles, p. 612, *supra*.

This is the only instance I know of *where the operational principles of the stardrive system have been utilized in a weapon*; e.g., the phasers and photon torpedoes of Star Trek do not seem to be and I have never heard that they were, related to the Warp Drive technology; the Warp Drive technology was a completely peaceful invention. Nor are the weapons in Andromeda directly related to Slip Stream, the weapons in Banner of the Stars are not related to Planespace, and the big gun on the Battlestar Pegasus is not seemingly related to whatever it is FTL drive they are using. But why not? Nuclear fission reactors use the same science as the first atomic bombs. It's only a degree of careful control that differentiates peaceful energy from destructive weapons.

- ✓ “The Cool Ship needs an equally cool weapon. If it’s a sufficiently humongous Cool Ship, it will be equipped with a Laser Beam on steroids: the Wave Motion Gun – an enormous Ray Gun that fires a massive energy beam capable of blowing away an enemy ship (in the ‘blow a battleship in half’ sense), sometimes an entire fleet, with one shot, and maybe even blowing up an entire planet. It doesn’t necessarily have to even hit; if you’re too close, the sheer energy bleeding off from the beam can be deadly. And don’t even think about trying to waste your time with puny Deflector Shields — it’ll just punch right through ‘em.” – TV Tropes (tvtropes.org), “Wave Motion Gun,” December 19, 2018 (“If the bad guys have one, it’s a Death Ray. Can lead to Wave Motion Fun [n. you might call that a Wave Motion Pun]”<sup>5</sup> *Id.*).

Actually the whole thing was silly to start; other than the need to create a premise for the adventures of the Space Battleship Yamato, why couldn’t the Princess deliver the information on the Cosmo DNA at the same time as she delivered the specs for the Wave Motion Engine? The humans, of course, left a path of destruction 148,000 light years long across the galaxy. Because that’s our thing, what we do.

- ✓ The Forest Through the Trees: In an action adventure program aimed at adolescent males, a beautiful princess from a distant planet brings the ‘wave motion’ to a bunch of young male action adventure heroes... who set off across the galaxy to find her mother. Who probably has a Queen-sized water bed with a full wave mattress.
  - “Stacy’s mom has got it goin’ on...” – Fountains of Wayne, “Stacy’s Mom” (2003).

---

*“The Answer to the Great Question... Of Life, the Universe, and Everything...  
Is... Forty-two,’ said Deep Thought, with infinite majesty and calm.”*

– Douglas Adams, The Hitchhiker’s Guide to the Galaxy (1979)

---

**Stardrive Patent Prosecution**: Unlike the other Patents, Stardrive Patent prosecution does not rest upon establishing connections between specific Applications; rather, Stardrive Patents rely upon the overall status of the Applications and Connections on the current Era Matrix at the time of prosecution.

The chance of successful prosecution of the Stardrive Patent is the average of the percentage of Applications complete on the current Era Matrix and the percentage of all possible *connections* completed on the current Era Matrix.

- ✓ For example, in the 1<sup>st</sup> Era, there are sixteen spaces for Applications and forty-two possible connections (count them!) between Applications. If the position prosecuting

the Stardrive Patent had six Applications (37.5%) and six connections made (14.2%), the chance of successful prosecution of the Stardrive Patent would be 25% (fractions truncated). Successful prosecution of the Stardrive Patent does not – unlike Patents – create any connections between Applications on the current Era Matrix.

Due to Existential Patents purchased during set up, most positions could begin with significant numbers of Applications and some Connections in the 1<sup>st</sup> Era, so prosecuting the GSD Patent could be accomplished. This could be a strategy, to load up on other Existential Patents during set up and pick up GSD in the first turns of the game. The tradeoff is that you must choose a Primal State that does not require GSD, take many Fundamental Realities (for Inheritance Points), and cannot begin the game with any ships.

- ✓ Finding an alien ship could be helpful... a position could receive a one-time concurrent bonus to prosecuting a new Stardrive if the position also successfully reverse engineers an ‘Alien Stardrive’ (see Flying Saucers, 3 Technology, p. 718, *supra*). All you need to do is get the forward arrow pointing backwards!
- Need for Speed: As with the GSD, COT Patents are used to increase the base speed of an original Stardrive Patent (*ut supra*). ET Patents may be used to give Stardrive Patents other capabilities. Subsequent COT and ET Patents based on the Stardrive Patent are prosecuted in the same way as the original Stardrive Patent.

---

*“‘Pilot’ is an ironic misnomer. Far from the mastery of the ship and vector that the word implies, a Pilot is merely the psycho-organic resistor in the Jump Circuit, a living module of circuitry in a far larger mechanism. The Primer induces a specific configuration of psychosomic orgasm in the nervous system of the Pilot. The vrai Jump Drive, the actual propulsion system, is entirely a mass-energy device, which enmeshes the ship in the psychoelectronic matrix of the Pilot’s psychic reference state, the fields synergized by conventional inorganic circuitry. Once this synergy is achieved, the Jump ‘begins.’ At the other side of quite literally immeasurable temporal discontinuity, the ship ‘comes out’ of the Jump an average of 3.8 light years away and most often roughly along the desired vector.*

*For what happens within this timeless moment, not for any romance of the spaceways or altruistic desire to serve the species, Pilots surrender all. ...Pilots claim that the interval of the Jump is both timeless and eternal, like the orgasm itself, that all else is shadow, that true union with the Atman is achieved, und so weiter.”*

– Norman Spinrad, *The Void Captain’s Tale* (1982) <sup>6</sup>

---

**Honored Passengers:** Behind the grandness of the Second Starfaring Age lies an ugly truth.

The Void Pilots, who would be today’s sex and drug addicts perhaps, are increasingly disheveled pariahs in the polite and high culture of both the Honored Passengers and trans-stellar society as a whole. They are the critical component to the Jump Circuit – unlike most sci-fi tech, the stardrive is not completely mechanical – and they allow themselves to be used and shunned. Each jump is a near-death experience for the Void Pilot, during whence they claim to meet the One and Only and timelessness; back in our world, everything is but a shadow. The time between

jumps is mainly the time for medical recovery of the pilot. After several jumps – many or a few repeated near death experiences, there is no coming back and they die from the physical toll of the Jump Circuit.

✓ *To Jump, someone physically suffers near death or dies.*

The entire Second Starfaring Age resides on this condition of mutual disgust and abuse attainment of the Void Pilots. This is the secret and mask of many societies and civilizations, more or less, which have considered themselves advanced or culturally superior to others or to those that came before; there is always something or someone who pays the price, someone who is expendable and untouchable.

The ‘sin’ of the Void Captain Genro Kane Gupta was being romantically attracted to a Void Pilot as a human; it begins with a casual conversation, to wit:

✓ “...he engaged in an unwholesome exchange of name tales on the sky ferry to the ship with the Void Pilot Dominique Alia Wu. On the day of the first Jump, he conversed with her at unnatural length afterwards. After the third Jump, they performed a sexual act.” – The Void Captain’s Tale, p. 7.

He speaks of himself in the third person, as if he was not there.

---

*“As with all artifice, ‘The Void Captain’s Tale’ depends on the cooperation of the audience for its effects. Norman Spinrad, like his characters, takes great risks; the rewards for readers willing to meet him halfway are commensurate.”*

– Gerald Jonas, “Inside Elsewhere,” *New York Times Archives*,  
May 22, 1983 <sup>7</sup>[Full Quote]

---

## Endnotes.

<sup>1</sup> Commentary: The Generic Stardrive (GSD) was originally called the NDSD, “Non-Descript Star Drive” back around 2000. In the final edit process in June 2018, I found one remaining reference to NDSD in 2 Expansion. I do not know when I changed the name of the basic stardrive.

<sup>2</sup> Commentary: *Ut infra* is always an acknowledgement or confession by the author that information is being presented slightly out of order. The same is not true of *ut supra*.

<sup>3</sup> Commentary: In various German phrases, it can mean mood, atmosphere, feeling, spirit, disposition, temper, morale, opinion, vein and humor.

<sup>4</sup> Commentary & Citation: I fondly remember going to my friend’s house after school in 8<sup>th</sup> grade to watch the first season of Star Blazers on TV. I later bought the pilot episode on VCR tape in the late 1980s. I have only seen bits of the other animated seasons and of the live action movie on YouTube. My first exposure to *anime* (TV tropes calls it “Heavily Macekred” anime) was Battle of the Planets (aka G-Force) on Saturday morning cartoons in 6<sup>th</sup> grade.

<sup>5</sup> Citation: “Puns are little plays on words that a certain breed of person loves to spring on you and then look at you in a certain self-satisfied way to indicate that he thinks that you must think that he is by far the cleverest person on Earth now that Benjamin Franklin is dead, when in fact what you are thinking is that if this person ever ends up in a lifeboat, the other passengers will hurl him overboard by the end of the first day even if they have plenty of food and water.” – Dave Barry (humor columnist, author).

<sup>6</sup> Commentary: Connecting the dots... Human telepaths served a very similar function in Shadow Ships in Babylon 5, which aired in the mid-1990s. Except that there was no escape from the ship and no ‘honored passengers.’

<sup>7</sup> **Citation:** “THE title of Norman Spinrad’s latest novel is a tip-off. This is science fiction as self-conscious art – perhaps ‘artifice’ would be a better word. On Mr. Spinrad’s *Void Ships*, interstellar travelers are kept alive by artifice – not just physically by life-support systems but also psychologically. A never-ending round of esthetic, intellectual and sexual diversions guards both passengers and crew from a mind-shattering encounter with the reality of the Void through which they are passing. Only one person on board actually confronts the Void: the Void Pilot, a woman whose nervous system is plugged directly into the ship’s circuits. Each time the ship jumps instantaneously through light-years of space, the Void Pilot experiences an orgasm beside which normal fleshly delights pale. Like all such pleasures, it ends too soon – but under certain circumstances, so the rumor goes, the Pilot’s orgasm can become literally endless.

The Pilot in ‘The Void Captain’s Tale’ seduces the Captain into betraying his trust with what might be described as the ultimate indecent proposal: pleasure everlasting. Mr. Spinrad does not shrink from the passages of sexual evocation his plot demands. Yet he never descends to the merely pornographic. Having established that his characters speak a futuristic language in which words and concepts from many 20th-century cultures are blended – they say things like ‘Vraiment, meine kleine’ and ‘Racial seppuku may be an aesthetically pleasing fini’ – he has available an erotic vocabulary that is neither too explicit nor too private.

As with all artifice, ‘The Void Captain’s Tale’ depends on the cooperation of the audience for its effects. Norman Spinrad, like his characters, takes great risks; the rewards for readers willing to meet him halfway are commensurate.” – Gerald Jonas, “Inside Elsewhere,” *New York Times*, May 22, 1983 (archives, available free online).

- ✓ GGDM might also be thus described as self-conscious (whether it is art or not is another matter) or extremely meta-conscious, artifice, never quite descending to the merely pornographic (see adult table discussion, *Encounter Suit*, 3 *The Big Bang*, p. 15, *supra*), takes risks and rewards readers who meet the work halfway.
- ✓ The concept of the Existential Void and artifice by which humanity shields itself, discussed throughout GGDM, is not particularly original, but subconsciously, I must have absorbed the idea (as described above) from *The Void Captain’s Tale*, but having internalized it, I believe – perhaps in a way similar to believers of religions and UFO conspiracy theories – that it is true and representative of the relationship of humanity and the universe currently. And perhaps, as G.K. Chesterton suggests (see feature quote, 4 *Government Titles*, p. 634, *supra*), having been completely convinced by it, I have difficulty justifying my belief to others. *Und so weiter.*

## Excerpt from Cosmos: A Personal Voyage

### Episode 10, The Edge of Forever

#### By Carl Sagan

[Carl Sagan is seated at a small wooden desk with a lamp, a sheet of paper and various objects]

In discussing the large-scale structure of the cosmos astronomers sometimes say that space is curved or that the universe is finite but unbounded. Whatever are they talking about?

Let's imagine that we are perfectly flat I mean, absolutely flat and that we live, appropriately enough, in Flatland a land designed and named by Edwin Abbott a Shakespearean scholar who lived in Victorian England. [Flatland is represented by a sheet of paper with various cutout shapes on it] Everybody in Flatland is, of course, exceptionally flat. We have squares, circles, triangles and we all scurry about and we can go into our houses and do our flat business.

Now, we have width and length but no height at all. These cutouts have some height, but let's ignore that. Let's imagine that these are absolutely flat.

That being the case, we know, us Flatlanders about left-right and about forward-back but we have never heard of up-down. Let us imagine that into Flatland hovering above it comes a strange three-dimensional creature which, [Sagan holding up an apple] oddly enough, looks like an apple. The three-dimensional creature sees an attractive congenial-looking square watches it enter its house [a square made of lines, with an opening for a door on the surface of the paper] and decides in a gesture of inter-dimensional amity to say hello.

"Hello," says the three-dimensional creature. "How are you? I am a visitor from the third dimension."

Well, the poor square looks around his closed house sees no one there and what's more, has witnessed a greeting coming from his insides: A voice from within. He surely is getting a little worried about his sanity.

The three-dimensional creature is unhappy about being considered a psychological aberration and so he descends to actually enter Flatland. [Sagan holding the apple above the paper] Now, a three-dimensional creature exists in Flatland only partially only a plane, a cross section through him can be seen. So when the three-dimensional creature [the apple] first reaches Flatland only its points of contact can be seen [the bottom of the apple]

And we'll represent that by stamping the apple in this ink pad and placing that image in Flatland. [Sagan stamps the paper with the inked bottom of the apple, leaving 3 or 4 dots]. And as the apple were to descend through slither by Flatland we would progressively see higher and higher slices which we can represent by cutting the apple.

[Sagan cuts the apple in half crossways and stamps it on the ink pad, then makes an impression on the sheet of paper in the same place as the original apple bottom points impression]

So the square, as time goes on sees a set of objects mysteriously appear from nowhere, and inside a closed room and change their shape dramatically. His only conclusion could be that he's gone bonkers.

Well, the apple might be a little annoyed at this conclusion and so not such a friendly gesture from dimension to dimension makes a contact with the square from below and sends our flat

creature fluttering and spinning above Flatland. At first, the square has no idea what's happening. He's terribly confused. This is utterly outside his experience. But after a while, he comes to realize that [looking down from above] he is seeing inside closed rooms in Flatland. He is looking inside his fellow flat creatures: He is seeing Flatland from a perspective no one has ever seen it before, to his knowledge. Getting into another dimension provides, as an incidental benefit a kind of x-ray vision.

Now our flat creature slowly descends to the surface and his friends rush up to see him [Flat creature returns to surface of paper outside his "house"]. From their point of view, he has mysteriously appeared from nowhere. He hasn't walked from somewhere else. He's come from some other place. They say, "For heaven's sake, what's happened to you?" And the poor square has to say: "Well, I was in some other mystic dimension called 'Up.'"

And they will pat him on his side and comfort him or else they'll ask: "Well, show us. Where is that third dimension? Point to it." And the poor square will be unable to comply.

But maybe more interesting is the other direction in dimensionality. What about the fourth dimension? Now, to approach that, let's consider a cube. We can imagine a cube in the following way: Take a line segment and move it at right angles to itself in equal length. That makes a square. Move that square in equal length at right angles to itself and you have a cube.

[Sagan holding a transparent plastic cube up to the light] Now, this cube, we understand casts a shadow. [The cube casts a shadow on flatland] And that shadow we recognize. It's, you know, ordinarily drawn in third-grade classrooms as two squares with their vertices connected. If we look at a three-dimensional object's shadow in two dimensions we see that, in this case, not all the lines appear equal. Not all the angles are right angles.

The 3-D object hasn't been perfectly represented in its projection in two dimensions [i.e. the shadow of the transparent cube on the flat paper surface]. But that's part of the cost of losing a dimension in the projection. Now, let's take this three-dimensional cube and project it, carry it through a fourth physical dimension: Not that way, not that way, not that way [Sagan pointing in the three directions]. But at right angles to those three directions.

I can't show you that direction. But imagine that there is a fourth physical dimension. In that case, we would generate a four-dimensional hyper-cube which is also called a tesseract. I cannot show you a tesseract because I and you are trapped in three dimensions. But what I can show you is the shadow in three dimensions of a four-dimensional hyper-cube or tesseract.

This is it [Sagan holding up a plastic transparent hyper-cube], and you can see its two nested cubes all the vertices connected by lines. And now the real tesseract in four dimensions would have all lines of equal length and all angles right angles. That's not what we see here, but that's the penalty of projection. So you see, while we cannot imagine the world of four dimensions we can certainly think about it perfectly well.

Now, imagine a universe just like Flatland, truly two-dimensional and entirely flat in every direction. But with one exception: Unbeknownst to the inhabitants their two-dimensional universe is curved into a third physical dimension. [Sagan is standing on an imaginary sphere] Maybe into a sphere but at any rate into something entirely outside their experience. Locally, their universe still looks flat enough. But if one of them, much smaller and flatter than me takes a very long walk along what seems to be a straight line he would uncover a great mystery.

Suppose he marked his starting point here [a square on the surface of the sphere is marked with light] and set off to explore his universe. [Sagan begins walking on the surface of the globe] He never turns around and he never reaches an edge. He doesn't know that his apparently flat universe is actually curved into an enormous sphere. He doesn't sense that he's walking around a globe.

Why should his space be curved? Because this universe has so much matter that it gravitationally warps space closing it back on itself into a sphere. But our Flatlander doesn't know this. After a long while, he'll find he somehow returns to his starting point. [Sagan appears on the north polar horizon of the globe as if he has circumambulated the globe] There must be a third dimension. Our Flatlander couldn't imagine a third dimension but he could sure deduce it.

Increase all the dimensions in this story by one and you have something like the situation which many cosmologists think may actually apply to us. We are three-dimensional creatures trapped in three dimensions. We imagine our universe to be flat in three dimensions but maybe it's curved into a fourth.

We can talk about a fourth physical dimension, but we can't experience it. No one can point to the fourth dimension. There's left-right and there's forward-back. There's up-down and there's some other directions simultaneously at right angles to those familiar three dimensions.

Now, imagine this universe is expanding. If we blow it up like a four-dimensional balloon, what happens? An astronomer on a given galaxy thinks all the other galaxies are running away from him. The more distant the galaxy, the faster it seems to be moving. This is just what Humason and Hubble found.

On the surface of this curved universe, there is no boundary or center. The universe can be both finite and unbounded.

*“Suzdal remained calm. He coded the genetic cats. He loaded them into life bombs. He adjusted the controls of the chronopathic machine **illegally**, so that instead of reaching one second for a ship of 80,000 tons, they reached two million years for a load of less than four kilos. He flung the cats into the nameless moon of Archosia.*

*And he flung them back in time.*

*And he knew he did not have to wait.*

*He didn't.*

*The cats came. Their ships glittered in the naked sky above Archosia. Their little combat craft attacked. The cats who had not existed a moment before, but who had then had two million years to follow a destiny printed right into their brains, printed down their spinal cords, etched in the chemistry of their bodies and personalities. The cats had turned into people of a kind, with speech, intelligence, hope and a mission. Their mission was to attach themselves to Suzdal, to rescue him, to obey him, and to damage Arachosia.*

*The cat ships screamed their battle warnings.*

*‘This is the day of the year of the promised age. And now come cats!’*

*The Arachosians had waited for battle for 4,000 years and now they got it. The cats attacked them. Two of the cat craft recognized Suzdal and the cats reported.”*

– Cordwainer Smith, “The Crime and Glory of Commander Suzdal” (1964)

**New Crimes:** Technology often creates new crimes (or really old crimes with new means); technology changes, humans don't. Before the dark web and massive theft of credit card numbers and personal information was the thing, I worked on civil prosecution of “satellite broadcast piracy” cases (what we called them). Similar to the illegal cable television boxes (there were billboards then picturing illegal cable boxes being sold from the trunk of a car), “satellite broadcast piracy” involved circumventing the conditional access controls on early individual receiver units (using emulators, glitchers, dead processor boot boards and unloopers), often using a PC, to get free pay-per-view and extra channels. But instead of selling them from the trunk of a car, these were sold over the internet, via credit card payment or COD and shipped through UPS.

And there were forums such as Pirate Den<sup>1</sup> and DSS Nation where people openly posted and exchanged information on how to steal satellite programming and later, there were hack legal websites that advised how to defend against lawsuits brought by the satellite cable providers! Eventually this process was defeated through various technological measures (e.g., Black Sunday) and improvements, and by a national and international legal effort (e.g., the Canadian Royal Mounted Police seizure of the Pirate Den servers and U.S. Marshals seizure of warehouses and servers by court-issued Writs of Seizure).

**Dr. Watchstop:** Doctor who??? It may be commonly assumed that the 4<sup>th</sup> Era of technology would result in the ability to travel time backwards and forwards. Assuredly, however, this assumption must be based on an erroneous pre-1<sup>st</sup> Era understanding of the universe.

- ✓ **Klaxor:** ... The lost phasinator has been activated near the edge of the spiral galaxy. It's still in input mode. **Alien Elder:** Thank goodness! Well, take it offline and roll back the local effect five minutes. We can't have the simple beings mucking up the time continuum, now can we? [The story ends by cycling back to the first panel.] – Epic Illustrated #34, Dr. Watchstop, “Wasting Time,” February 1986.

- Crossing the Rubicon: Is time relative or objective? Suppose you set your time machine to travel back to January 49 B.C. in northern Italy. And when you arrived, you discovered it was mid-autumn and the farmers were harvesting their crops? Because January 49 B.C., when Julius Caesar crossed the Rubicon River with his legions and became an outlaw was mid-autumn because the Roman calendar was out of step with the seasons due to political abuse by the Pontiffs who were in charge of determining when intercalary months were added to the calendar – originally intended to keep the calendar in synch with the seasons, they were usually added or withheld for political purposes. Such was the situation that Julius Caesar’s third year of consulship was 446 days coinciding with his calendar reform to bring the calendars back into synch with the seasons (and also quite politically convenient for him).

✓ The Romans *didn't know* it was 49 B.C. – *human* calendars are political, subjective.

Most science-fiction stories, especially the cheesy kind produced for television (e.g., *The Time Tunnel* (1964)), tends to just ignore the problem (along with language, culture, causality, history, etc.) and vaguely assumes that time is objective, a matter of simply counting numbers backwards from our presumably correct current date (this would even be problematic as to Greek and Roman dates). But in this example, the time machine somehow ‘knows’ or senses the consciousness of the Roman population and goes to the date as the Romans knew it and not simply counting backwards the days from our time.

- Rubicon the Crossing: Would you, if given the chance, want to travel forward in time? It is usually presented as a given, usually as a necessary plot choice of adventure films, that everyone would like to see the future, beyond the end of their expected lifetime. But I don’t know, I have reservations. Science-fiction imagination has presented many grim futures, and not all of them implausible and many of them increasingly plausible from our current view. It is equally possible, a coin flip, that any future you might travel to is as grim as it is bright, as blighted as it is blithe, as blithe as it is benevolent. There is a lot we would need to understand before departing, for example, is the many or divergent worlds theory correct? Is time unalterable or paradoxical?

---

*“Well, it could be pure coincidence, but Terminus seems to be at the exact centre of the known universe.” – Dr. Who, “Terminus, Part 1” (February, 1983)*

---

**Terminus**: Alternatively, there is a theory that the current exponential advance of technology cannot go on indefinitely; that at some point, we would completely understand the nature of the universe, that technology would reach a state of engineering perfection, and that civilization would catch up with its technology and culture and technology would co-exist comfortably for eons until we got tired, or we or the universe changed, or we went onto something else. I don’t know when this point would be reached, any more than I can describe the operation principles of 3<sup>rd</sup> Era technology. However, it may be that there is no 4<sup>th</sup> Era of technology, or that the 4<sup>th</sup> Era is the terminal Era. This is a decision for the participants, as part of the story-arc of the game, participants may decide when or if there is a terminal point to technology in this game, or it may occur that the game simply ends before anyone has to reach that question.

- Ancient Interstellar Cultures: We are in the mental habit of dividing things and ranking them; because culture as a concept existed from ancient times, and technology was the seemingly new phenomena (though it really isn’t), technology was regarded as a separate thing, an

outside force exerting a pushing, guiding, warping effect on culture. Thus, the vision evolved, especially in the 20<sup>th</sup> Century, of a somehow adversarial relationship between culture and technology in civilization, and that technology was advancing much faster than culture could adapt to it (*à la* the Cold War). This worldview is a symptom of the cognitive dissonance of the late 19<sup>th</sup> and early 20<sup>th</sup> Century populations caused by rapid technology.

Probably taking a page from *Dune* (1965) which begins in the year 10,191 A.G. and the first year of their calendar begins around 13,000 A.D. on our calendar,<sup>2</sup> Star Wars' (1977) hyper-space-drive technology appears to be over 25,000 years old and human planetary technological civilization much older.<sup>3</sup> Both *Dune* (1965) and *Star Wars* (1975) represent civilizations that have had galactic interstellar travel for far longer than the commonly known history of human civilization on Earth – where were your ancestors 25,000 years (1,250 generations) ago? Where would you go to visit them if you had a time machine?

Generally *Star Wars* technology appears to have reached near stagnation – or at least advances much more slowly than ours in the latter part of the 20<sup>th</sup> Century – but their culture is far from what anyone would call perfect. *Star Wars* technology has not led to any final galactic utopia, rather, the movies, the entire franchise, is premised on an endless militant space-opera adventure and mythic morality play. In fact, *Star Wars* is a 1960s and 1970s view of our world, tossed into the sky and blown up to epic proportions, as is nearly all space-opera fiction; the flaws of *Star Wars*' galactic civilization, their cognitive dissonance with advanced technology, are the flaws of our world because we can hardly imagine any better of humanity or the universe (echoing Norman Spinrad, Governor Nix in *Tomorrowland* (2015) and maybe a little Pangloss).

**Thumbing Our Nose at Einstein:** Einstein was a good fellow, don't get me wrong, but ... implicit in any sort of faster-than-light travel or transport system (e.g., FTL, Stardrive, Stargate) is likely some sort of temporal technology to abrogate the time-dilation effect of relativistic travel. Arguably, there may be some means of FTL travel – such as taking a 'shortcut' through an alternate universe – that would not necessitate a temporal abrogation. Most players are not likely to envision that a turn represents generations and centuries of real time, so the admission of Stardrive technology necessitates the admission of some level of temporal knowledge/effect (even if as a side effect of Stardrive), which opens the door to temporal technologies in the game.

---

*“For example, suppose you traveled into the past and somehow or other prevented your own parents from meeting. Why, then you would probably never have been born which is something of a contradiction, isn't it since you are clearly there.” – Carl Sagan, Cosmos, Episode 8*

---

**Drop Ship 242:** The alien troopers readied as their ship prepared to drop out of hyperspace in the target planet's upper atmosphere. It was necessary to blind drop on the Earth due to its legendary defenses, there would be no time for reconnaissance, drop would be made from 100 miles up at full speed.

The troopers boarded their plungers; at 100 miles above the Earth, three dozen enormous saucers appeared and descended long shadows on the major cities of the Earth, each carrying thousands of planet scrubbers, war machines, and a large fighter complement, along with the massive steri-

lizer weapon in the center bottom facing down. To the alien commander's surprise, no Earth defense forces came up to meet them, and no shots from Orbital Bases hit their top shields. The planetary civilization below appeared to be very primitive, having only reached the atomic-electronics stage. Still, they had a job to do and their programming was 'all in for the job.'

Two years later after the invaders were defeated, perhaps by the primitive native forces, perhaps by running out of supplies, perhaps by the industrial pollution in the atmosphere, perhaps by microbes, 11<sup>th</sup> Century Earth inherited their technology which was reverse engineered and the sociopolitical and cultural changes wrought by the invasion hardened the Earth's resolve to go out and conquer the stars, to spread such fear, ruthless destruction and terror that no aliens would ever think of invading the Earth again!

**Classic Paradox:** A classic paradox: If you go back in time to prevent a bad event from happening, and you succeed, then you did not go back in time to prevent a bad event from happening? This instantly unravels 95% of time-travel fiction.

- ✓ The 2016 series *Travelers*, which I have not watched any of, has this very problem from the starting description: If they succeed in preventing the bad future then they did not travel back in time to prevent the bad future. Stop, do not pass GO, do not collect \$200. Go straight to jail.

The science-fiction theme in the *Travelers* series is just a gimmick (a 'tacked on theme'), as is much of television science fiction, very little of it is truly science-fiction literature. A review of the *Travelers* episode summaries shows that the time travel was just a set up for the drama tangle; the episodes summarize who is lying, cheating, backstabbing, blackmailing, or sleeping with whom in each episode. The same plot summary could have been written for any 80s evening soap, *Travelers* is thus an 80s evening soap with time travel and it is not surprising that my friend's wife loved it. *Travelers* was *Quantum Leap* plus *V* plus *Dallas*.

One-way causality is a pain in the nekta, but it is what keeps us sane. Sort of. Less is more, more or less.

- ✓ **Clara:** Time can be rewritten. **Doctor Who:** With precision. With great care. And not today. But you know that of course, otherwise you wouldn't be threatening me... If I change the events that brought you here, you will never come here and ask me to change those events. Paradox loop. The timeline disintegrates. Your timeline. ...  
**Clara:** I have seen you change time, I have seen you break any rule you want. **Dr. Who:** I know when I can, I know when I can't. ... – Dr. Who, "Dark Water" (2014).
- **Ghost in the Daylight:** In *The Time Traveler's Wife* (2009), Henry can never stop his mother from getting into that car (as his father wishes) because that would create a paradox – he survived the car accident when he started time jumping. To go back in time and prevent his mother from getting into the car would mean that he never started time jumping.

At the end of the movie, though, they did allow that he appeared on one of his earlier time jumps in the meadow about five years after he died (sort of 'life after death'), meaning that he travelled forward to a time after his own death (Henry never however, preexists himself, never lands before the first moment he jumped).<sup>4</sup> Yet he seemed to have understood that he died, as Clara was much older and didn't hide her sorrow much, neither did their daughter, Alba. So was it life after death?

Clare completely outwitted Henry in having a daughter, one could think that with all of his time-jumping experience, he would have anticipated that she could be impregnated by an earlier version of himself before he had the vasectomy. This drives home that the point of the movie was the child, Alba, whose name he obtained from meeting her in the future, so she was already named before she had a name; he did not encounter Alba in a time-jump event until Clare was near full term and they were deciding on the child's name.

Suppose they had decided as an act of rebellion to name the child Michelle or Sonja after he met Alba in the future? What would have happened? Would that have meant that he never met her on the time jump? Was it all pre-destiny? He had knowledge, was he unable to make any other choice in the naming of the child? He could have lied to Clare about the name of their child.<sup>5</sup>

At that future point (the end of the movie), he was effectively a ghost in the daylight, which suggests something interesting about ghosts if they exist. There is no indication whether he appeared after that, but one would assume that eventually his appearances in the future would end, as well as his encounters with his time-jumping daughter, unless she is able to fully control where she goes in time.

- ✓ **TV Show Host:** So, are you saying your subjects are people or ghosts? **Dr. Mieselhoff:** Are you saying there's a difference? – from Einstein's God Model (2016).

---

*“Surely the inventor of a time machine should have a few screws loose, and the glint in his eye should not be from tears.”*

– Roger Ebert, review of *The Time Machine* (2002), March 8, 2002

---

**The Door to That When is Closed:** Unfortunately, this game is designed by and played by pre-interstellar primitives living before the 1<sup>st</sup> Era of interstellar technology (i.e. people who can only see the shadow of a hyperbolic cube), and therefore, is severely limited in its possibilities. Generally speaking, this game (and the Concierge) is not capable of handling the complications, alternate universes, and paradoxes, e.g., grandfather paradox, ontological paradox, causal loop, predestination paradox, quantum headache paradox<sup>6</sup> – I made that last one up, but who's to say I didn't already invent it before I made it up? – that would result from allowing unlimited or largescale temporal technologies. Therefore, any temporal technologies developed in GGDM will be extremely limited (most professional writers and movie directors don't do a good job with temporal technologies either).<sup>7</sup> The Concierge should not allow any sort of temporal technology that causes the game to collapse into cracked causality chaos.

- ✓ For example, the writers of the original Planet of the Apes Movies (1968-1973) were not careful or cared less about continuity. The first sequel, Beneath the Planet of the Apes and featuring the original characters – thus taking place shortly after the end of the first movie – ended with the original human astronaut, Taylor, destroying the world with a doomsday bomb. Thus, humans were what the ape scrolls said they were and that would seem to be the end of it. But to make a third movie, they had to introduce time travel, sending apes from the future back to the past, back to the world and timeline from which Taylor originated.

By the time of the fifth movie, the narrative frame – an orangutan lawgiver is reading scrolls to a mixed audience of ape and *normal* human children – showed a future set centuries after (but millennia before the first and second movies?) the events of the third, fourth and fifth movies that detailed the ape revolt, which seems to directly break with the first and second movies where humans are devolved to wild beasts (required happy ending retcon?). Then in 2011, a new series of Planet of the Apes movies was added, not a reboot of the original movie, but a seeming reboot of the events of the third movie of the original franchise. So, Planet of the Apes taken on the whole has become a confusing mash of sloppy time-travel, social-messaging sci-fi cinema, Hollywood pressures, partial reboots and/or alternate futures.<sup>8</sup>

Some positions in the game may progress into the 4<sup>th</sup> Era, sans any automatic assumption that doing so implies or necessitates temporal traverse technology. The acceptance of temporal technology will depend in large part on the cleverness of the players in designing such technologies; the meaning of such within the game and the current game circumstances, and the record that the players proposing such technologies have established with the Concierge.

- ✓ For example, the Krenim temporal weapon ship (featured in the three-part “Year of Hell” (1997) arc in Star Trek: Voyager) that erased entire homeworlds from history, sending out massive temporal alternate history shock waves, in an attempt to restore the Krenim Imperium, is exactly the kind of causality chaos that GGDM is not suited to handle, but the chronitron torpedoes would likely be workable within the GGDM framework. Predictably, each attempt that was not 100% successful in restoring the original Krenim timeline, required another attempt to fix what went wrong in the previous attempt, *ad infinitum*. Annorax then exhibits mythopoeic thinking in explaining his failure by stating that time itself is retaliating against him, preventing him from success, because of his arrogance in manipulating time (that is, that his failure is a personal decision on the part of *time*). Captain Janeway acts the same way toward her ship. The whole mess collapses when Voyager rams the Krenim temporal weapons ship.<sup>9</sup>
- ✓ In George Oliver Smith’s 1947 better-mousetrap short story, “Rat Race,” a government lab has a problem: It is being overrun by rats and can’t get any rat traps because of wartime production priorities. So they make a better mousetrap: A magnetic field, the mice go through and disappear. Problem solved. You may have guessed by the end, that it was sending them back in time. Back in time to the weeks before when the lab was being overrun by rats. And the rats who went back in time had babies, the same rats could go through the mousetrap many times and have parallel existences, having lots of babies. Until the country is being overrun by rats.
- Un-rung: The core issue for the universe stricken with the causality affliction is that the bell cannot be un-rung. Events that have happened cannot be made to un-happen, the dead victims cannot be brought back to life. We are left then with either various attempts to prevent the bell from being rung, or retribution, punishment, and repair after the bell has sounded.
  - ✓ “We can’t know everything. The crooks always lead the cops, be it in drugs, theft or anything else. All we can do is bring the hammer down on the futures of those who get caught.” – Ken Davidoff, “Astros-Patriots cheating comparison adds layer to MLB’s decision,” New York Post, November 16, 2019.

This is the limitation of our justice system and our medicine and our lives. However, I will concede that causality does create meaning that humans crave; how meaningful would events be if they could be undone? Or if they appeared in any random order?

- ✓ When was the last time something stupid, annoying, petty or just plain wrong spontaneously un-happened? Well? I'm waiting. No, that would be called a miracle, and miracles are about as real and probable as unicorns and Super Man movies.
  - This is a funny sentence: "...that the invention of the causality violation device was the cause." – Dexter Palmer, Version Control (2016).
    - See Alternating History, 6 Government Titles, p. 654, *supra*, for full feature quote.
- Four Floors: When a character travels in time, are they simply going backward or forward to a point in time at the same spatial location on the planet surface – ignoring planetary orbital movement and planetary rotation, otherwise the character might find herself in space without a suit – from where they began? Clearly the character in H.G. Wells' Time Machine (1895) simply went forward in time without moving spatially (and didn't end up in space without a suit), and doesn't travel far from the location of the time machine, but has to retrieve it from the Morlocks who hid the time machine a short distance away. Roger Ebert noticed it too:
  - ✓ "The time machine has an uncanny ability to move in perfect synchronization with the Earth, so that it always lands in the same geographical spot, despite the fact that in the future large chunks of the moon (or all of it, according to the future race of Eloi) have fallen to the Earth, which should have had some effect on the orbit. Since it would be inconvenient if a time machine materialized miles in the air or deep underground, this is just as well." – Roger Ebert, review of The Time Machine (2002), March 8, 2002.

On the other end of the British spectrum is the Time and Relative Dimensions in Space – Dr. Who's TARDIS which goes pretty much anywhere and anywhen in this universe and a few other universes. Most other time-travel fiction, from the awful Time Tunnel series (1966-1967) to the edgy, hard-bitten 12 Monkeys movie (1995) are careless or indifferent as to movement in spatial coordinates when travelling in time – James Cole, on his first trip back in time from Philadelphia in 2035, lands naked on the Western Front during WWI (and not in space without a suit)!<sup>10</sup>
- Landing Nude: Interesting aspect of the Time Machine story is that he did not travel backwards in time from his starting point, but did travel back to his starting point from the future. H.G. Wells certainly had an interest in history so it is possible that this was a public relations consideration; to have traveled backwards in time (800,000 years) as far as he did forwards in time would have offended the commonly-held (but crumbling) Christian-calculated biblical age of the universe (or at least the Earth, which was the same back then) since creation.
  - ✓ Henry in The Time Traveler's Wife always lands nude in the past or future, like James Cole on the Western Front in WWI, but has no spatial difficulties, in fact, he frequently lands in 'the meadow' behind Clare's parent's house (where she plays as a little girl, *ahem*) as if that place were spatially fixed in another dimension. And the family never moves away.

- ✓ Incidentally, if little Clare happened to see him nude – is he a pervert? He certainly would have been arrested if the cops found him nude. The story skirts the issue because she is his future wife and the mother of his time-travelling daughter. She had sex with him when she was 17, then he stopped appearing in the meadow and they didn't meet until almost ten years later, and he didn't know her, so his jumps back to the meadow...
  - ... well, it's probably like Dr. Who and Riversong.

---

*“The paradoxes resolve themselves, by and large.” – Dr. Who, “Hide” (2013)*

---

**Taming Tea-sipping Time Travelers:** Some argument was made that with this carefree statement, the series violated its own carefully established rules of writing to avoid paradoxes.

Paradox resolution is not always a nice clean process though! One of the most clever creatures in Dr. Who universe were the Reapers (before the Weeping Angels), temporal predators who swarm like bacteria to the wound in time created by the temporal paradox (“Father’s Day” episode, I particularly noted when the Doctor said this wouldn’t have happened if the Time Lords were still around...). If participants in GGDM decide to play around with time, these guys just might appear! The only safe place is an old building; the older an object is, the more difficult it is for them to pass through it (because of its Temporal Constructural Element ☺).

In the 2014 “Dark Water” episode, they modified the narrative a bit to make less contradictory rules about paradoxes in Dr. Who ... like a News Event in GGDM ...: Now time can be rewritten with great care and precision, even if it causes an obvious great paradox, and he knows when he can and when he can’t! Except that the writers stop short of just saying he can rewrite paradoxes. Moving on to Looper (2012)...

- ✓ “To bring this back to Looper, it seems as if the depiction of time travel in this film is somewhere between Leibniz’s model of God, and some of what was just described in regard to quantum phenomenon, in a way which is more fuzzy than Leibniz imagined, but more like that of quantum physics. *For rather than a God which strives to produce the ‘best possible’ universe, it seems like that Looper aims at something much more realistic, at least in terms of quantum physics, namely, a universe which aims to produce the most consistent possible version of itself, as manifested by a pull of sorts towards consistency.*” – Christopher Vitale, “Collapsing the Fuzzy Wave: Rian Johnson’s ‘Looper’ (2012), Quantum Logics, and the Structures of Time Travel Films,” networkologies (blog), written in 2012, updated and reposted, October 31, 2014 (emphasis added).

Conversely, author Julian May carefully limited the spatial and temporal range of time travel to one point in the Earth’s past, *Pliocene* France, just where the alien Tau and Firvulag had settled.

- ✓ “While the discovery of time travel is a great scientific achievement, its practical application is limited. After the initial discovery, it is soon found that due to its very specific geographic and other requirements, the time gate only works in one location and one point in time in the past. The device can be used to transport people, animals, and objects back in time to the Pliocene era intact, but any attempt to travel forward in time from the Pliocene by the same method ages the traveler or object by six

millions years instantaneously. This effectively makes the portal a one-way trip for any living being, and other organic objects. This limitation also made communication from the time-travelers almost impossible, making it a blind one-way trip.

After the death of the inventor, his widow finds herself inundated with a steady stream of late 21<sup>st</sup> and early 22<sup>nd</sup> century misfits/outcasts begging to be allowed to escape the modern world for a chance to start over in the simplicity of the Pliocene. The widow finally gives in and eventually establishes a regular training program for the ‘groups’ making the trip back in time to ensure they have the basics for survival and a trade in the Pliocene era. To prevent any contamination of the past, the Galactic Milieu sterilises all females by salpingectomy before allowing them to go back to the past and does not allow any advanced technology that will not decompose after around a hundred years to be taken. The Milieu also does not allow any operant meta-psychics to go back to the Pliocene.” – from Wikipedia article, “Saga of Pliocene Exile,” (early 1980s series by Julian May), captured October 29, 2018.<sup>11</sup>

It is as if to suggest a divine plan (i.e. the author’s ☺) is in play allowing these two times to narrowly connect while avoiding temporal paradoxes.

---

*“The fundamental difference between the attitudes of modern and ancient man as regards the surrounding world is this: for modern, scientific man the phenomenal world is primarily an ‘It’; for ancient – and also for primitive – man it is a ‘Thou’” – Henri Frankfort, 1946*

---

---

*“Any phenomenon can surely be experienced as both an It and a Thou: consider, for example, a pet and a patient.” – Robert Segal, 1977*

---

**More than a Feeling (can you hear it?):** Despite what Hollywood movies show, travelling back to visit a historical era would not likely be much use, for example, speaking to someone from Elizabethan England, even an educated person from that period, would be like speaking to a nine-year-old version of yourself.<sup>12</sup>

I have given considerable thought to how my life might be changed if I travelled back in time. I have come to the conclusion that if I did it all again, I wouldn’t do any better than I did the first time, despite my knowledge of the probable outcome. I don’t have the level of intellect and wisdom to make it ‘come out right.’ If I changed the bad things that happened, other bad things would have happened. There are too many variables and branches for my SQ. Likely, the outcomes would be worse.<sup>13</sup>

- ✓ You are here reading this now. If you could repudiate history, would you go back in time and prevent the invention of gunpowder, would you destroy the draft of Novum Organum (1620), would you prevent either Genghis or Kublai Khan from being born, would you make Buddha a king instead of a sadhu, would you prevent Christ from being crucified or have him crucified upsidedown, would you have Christopher Columbus committed to an insane asylum in 1490? Would you kill Hitler as a baby? Suppose there were a point in history where a race could decide its own history?

For much of my life, I have had a vague but persistent intuition of a parallel between intellectual, cultural, political, and religious development of human civilization globally, and the cognitive developmental stages through which we all pass as children to adolescence and adulthood.<sup>14</sup> For example, “mythopoeic thought” of ancient human civilizations, described by Henri Frankfort, seems to correspond roughly with Jean Piaget’s preoperational stage of cognitive development. This mythopoeic condition existed despite the fact that the majority of the population – as is common in any human population – *was adult*. That is, *adults had mythopoeic thinking as their worldview*, it was not a trivial thing, and it should not be trivialized. Overall, this suggests to me that the general level of abstract thinking that exists in the current population has not always existed (though there were always stand-out groups or individuals who were ‘ahead of the curve’ in their time); others would point to the late advent of empiricism in humanity.

- ✓ When you live with and adore cats and they adore you back, you learn the intelligence and personality of each cat. Many times, they remind us of small children – forever infants they are to us as Roger Caras wrote in 1989 – yet at the same time, they are the *viable adults* of their species capable of survival, fighting for mates and territories, and raising young. With only a couple of ticks difference in SQ and neural mass, we may appear the same to alien intelligences; our lives a brief flicker, our games and machines like cat toys, our attention spans short, our dramas silly play.
- ✓ This long-unspoken dichotomy of adult human populations and the infancy of human civilizations is at the core of nearly every debate about humanity, as it is at the core of our relationship with our pets, and our imagined relationship with a supreme being or creator (in the current version). It is also probably the core problem of any macro-view of humanity, e.g., macro-history and macrosociology.

How old are we now?<sup>15</sup> Development of realism, a cornerstone of modernity, as opposed to medieval and Aristotelian idealism, wishful thinking or magical thinking, seems to correspond to an operational stage of human development. However, attempts to form concrete ideas of this fuzzy parallelism are comparable to the alleged synchronicity of The Wizard of Oz and the Pink Floyd’s Dark Side of the Moon album.

- ✓ Even if I am completely, dead, demonstratively wrong, it’s not a bad image. It offers some larger framework for the lurches, stops and mental chaos of human history, within a very human frame of reference instead of some distant, murky deity or esoteric concepts.
  - ✓ If I am correct in this feeling, however, it provides an inevitable – an 8-year old human cannot refuse to grow up (unless your name is Peter Pan) – but very hazy direction, with no predictive value on how it might play out, to the future development of humanity, barring some enormous disaster.
- **Mythopoeic Thinking:** Mythopoeic means “myth-making” so that mythopoeic thought is a cultural intellectual habit and worldview where myths are constructed to explain observed events, origins, and behaviors.
- ✓ Dr. Stephen Griffith, Lycoming College, during a lecture in Philosophy of the Occult class, offered perhaps an explanation for the beginning of Abrahamic religion, from a mythopoeic perspective of ancient humanity. To the tribesman there were three objects (three is a common special number in the ancient world), the Earth where we stood, the Sun and the Moon that moved across the sky. And so the Sun rose every

day and provided warmth and light, and the Sun went away, and the Moon rose, providing night illumination and a steady progression, and the seasons marched by in order. And that was their world. But on certain occasions, during the day, something big would make the sun go away (i.e. a solar eclipse) and the world would grow dark. So there was a fourth thing out there, something that was more powerful than the Sun – casting aside our modern understanding of orbital mechanics – there was some invisible being that could make the Sun go away. This thing was more powerful than the Sun god and they were very afraid.

- ✓ Carl Sagan cleverly explained in *Cosmos*, Episode 7, that Paleolithic ancients may have thought the stars were the distant campfires of great tribes in the night sky who should be venerated and appeased lest they come down and kick our asses.
  - “One night I thought the stars are flames. They give a little light at night as fire does. Maybe the stars are campfires, which other wanderers light at night. The stars give a much smaller light than campfires, so they must be very far away. I wonder if our campfires look like stars to the people in the sky. But why don’t those campfires and the wanderers who made them fall down at our feet? Why don’t strange tribes drop from the sky? Those beings in the sky must have great powers. I don’t suppose that every hunter-gatherer had such thoughts about the stars. But we know from contemporary hunter-gatherer communities that very imaginative ideas arise.” *Id.*
- ✓ Both Columbus and Tecumseh and his brother used Western knowledge of astronomy to correctly predict the exact timing of local solar eclipses which gave them divine power over frightened mythopoeic tribesmen.

In all myths, the world is personified by human-like gods, spirits, and sapient natural forces, such that each natural event represents a personal choice on the part of a god, spirit or sapient natural force. Mythopoeic thought remains infused into our daily language; it is the origin of anthropomorphic references in our language, for example, ‘it looks like it **wants** to fall over,’ or ‘the wind is **trying** to pick up’ or ‘**she’s** solid steel’ referring to a machine and not a female bodybuilder. We can hardly say anything without an implied anthropomorphic (and even divine) reference, for example, ‘tasks waiting to be done’ implies patience on the part of the tasks; though the term is capable of being used neutrally, it is usually not taken so. Similarly, when something ‘provides an example,’ even though that something is not a person who is intending to do so, it is difficult to mentally separate ‘provides’ from perhaps divine or parental beneficence.

- ✓ In the crowd-funded movie *Fifth Passenger* (2018), the doctor, the navigation officer, and the agricultural technician were discussing the catastrophic environmental events on Earth. The doctor refers to “Mother nature” and the navigator refers to Earth as “her.” The agricultural technician ends saying, “About the only thing we do agree on for sure is that the planet is a woman.”

This is different from modern thought where events and behaviors are all tied to an underlying set of neutral natural laws, forming a consistent pattern, so that we look to formulate laws and math expressions, and to test and adjust them until they predict correct results. It might be argued then, in a very careful and circumspect way, that modern minds display greater abstract intelligence than ancients (however, I still display mythopoeic traits in my absurdism).

Whether this change is a result of cultural intellectual development or whether it is a result of some physiological change in the human brain (e.g., Julian Jaynes' bicameralism) is still debatable – but in evolutionary terms, the odds of a wholesale physiological change in the human brain through the population in just the 2000 years from classical antiquity, is very remote, *but not impossible*.

Viewed in these terms, e.g., Henri Frankfort, *ut supra*, creation science, intelligent design, and theistic evolution are in succession the last bastions of mythopoeic thinking in the West. After the Fundamentalist had screamed themselves into hoarse absurdity in the 1980s (I was there), intelligent design advocates attempted a more nuanced approach (something less than a sledgehammer to crack a walnut), and failed in 2005.

- ✓ “By the mid-1990s, intelligent design had become a separate movement. The creation science movement is distinguished from the intelligent design movement, or neo-creationism, because most advocates of creation science accept scripture as a literal and inerrant historical account, and their primary goal is to corroborate the scriptural account through the use of science. In contrast, as a matter of principle, neo-creationism eschews references to scripture altogether in its polemics and stated goals (see Wedge strategy). By so doing, intelligent design proponents have attempted to succeed where creation science has failed in securing a place in public school science curricula.

Carefully avoiding any reference to the identity of the intelligent designer as God in their public arguments, intelligent design proponents sought to reintroduce the creationist ideas into science classrooms while sidestepping the First Amendment's prohibition against religious infringement. However, the intelligent design curriculum was struck down as a violation of the Establishment Clause in *Kitzmiller v. Dover Area School District*, the judge in the case ruling “that ID is nothing less than the progeny of creationism.” – from Wikipedia article, “Creation Science,” February 5, 2019.

Their last trenchline is theistic evolution which tries to be unobtrusive and inoffensive so that no one notices.

- ✓ See Dating Man discussion, 5 Beginnings, p. 57, *supra*.
- The Fine Print –Isms: Parallelism used here (not to be confused with the theory of the mind concept, psychophysical parallelism) is a fuzzy concept, it is an analogy that works and has intellectual and cognitive value if it is not pushed to definition, details and precision.

Parallelism should not be construed as an absolution of humanity for all of the egregious past wrongs inflicted and committed by every culture, in every time, across all of the regions of the globe. Parallelism is not a moral judgment; it is not to say that all of the things humans did in the past are forgiven as we forgive children for their transgressions due to immature judgment – I am not the Christian God. It is the same as the dichotomy of cats: Though our species was childlike in a mythopoeic sense, the population was made of adults capable of individual reasoning, reproducing, childrearing, and all the things that eventually led to our civilization now (see related discussions in 4 and 5 Taxation & Census generally, *supra*). Rather, parallelism is simply an intuition, perhaps an observation that is pre-theoretical:

- ✓ “The pre-theoretical intuitions are decidedly strong and clear. What is unclear is how the pre-theoretical intuitions are to be accommodated theoretically within the favored

analysis, and it is this that leads reductionist to contend that the intuitions are inconsequential. At the very least, the anti-reductionist is owed an account of why the intuitions arise if they are not accurate.” – John W. Carroll, “Anti-reductionism,” The Oxford Handbook on Causation (Ch. 13, p. 292), Ed. by Helen Beebe; Christopher Hitchcock; Peter Menzies (2009)(text found on Google Books).

*Realism* is used here in the sense of Merriam-Webster online dictionary, **1**: concern for fact or reality and rejection of the impractical and visionary and **3**: the theory or practice of fidelity in art and literature to nature or to real life and to accurate representation without idealization. GGDM is a thorough work of modernity as it somewhat militantly emphasizes profound realism – as much as can be had in a science-fiction or space-opera setting – as the best and base means of understanding and rarely discusses what might be ideal.

- ✓ Contrary to some arguments, realism does not entirely displace idealism, and they are not exactly as opposite as they seem; rather, they exist side by side in some kind of relationship within our modernity. If you are trying to tell me you have a solution to a social problem, I will inquire about what you believe is the ideal condition to be reached by the solution and on what ideological, religious, intellectual or philosophical theory it is based. After that, I probably won't agree with you or be entirely convinced, but may be thankful for a good discussion.

I would argue that GGDM is more a *post-realism* than realism work. Post-realism occurs when our society realized that reality is not quite what we thought it was; when cracks develop in the concrete floor (upon which the psychology of realism depends) due to the propagation of quantum physics, sub-atomic physics in general, computer animations and virtual realities, advanced filmmaking techniques and special effects, science-fiction imagination becoming science fact, the systemization of public relations, propaganda, and now, social networks, sophisticated foreign trolling, and as Rand Corporation authors put it, “Truth Decay.” We are not yet willing to abandon the building as haunted, but we are not quite as sure of what is real as we once were, and reality has become incredibly complicated, losing much of its initial-seeming clarity, practicality, charm.

- Putting Away Childish Things: “When I was a child, I spake as a child, I understood as a child, I thought as a child: but when I became a man, I put away childish things.” – 1 Corinthians 13:11 (King James Bible).

That I comment throughout GGDM about the Existential Void and Absurdism (and make absurdist points), might lead some to believe that I am pessimistic, nihilistic, and perhaps in need of psychiatric evaluation. They might also, by extension, conclude that reading GGDM is not good for youthful minds. All of the preceding (except possibly the need for a psychiatric evaluation☺) is the opposite of what I consider to be true about GGDM, the opposite of my intent in GGDM. Consistent with my sense of parallelism discussed here, much, if not all, of GGDM is about humanity putting away childish things. So is physical science and empiricism, but in a different way. You can handle it or you wouldn't be this far into the text of GGDM; GGDM is perfect reading for youthful minds, as it is they, not us, who will put away childish things.

- ✓ “I have been thinking about what Christ will mean in the future. We'll need a new form of Christianity in a time when the world has come of age. I think there is only one purpose of religion in the modern world where people must come and share each

other's suffering and share the suffering of God in a godless world. We'll need more than just religion in the former sense. We need faith and Jesus Christ as its center. Real Christianity means sharing each other's pain. It is not for us to prophesy a day when men will once more ask God that the world be changed and renewed. But when that day arrives, there will be a new language, perhaps quite non-religious, but liberating and redeeming as was Jesus' language. It'll shock people. It'll shock them by its power. It'll be the language of a new truth proclaiming God's peace with men." – Dietrich Bonhoeffer's swan song speech in *Bonhoeffer: Agent of Grace* (2000).

But I am not going to turn any pages in history here, with GGDM. Humanity is notoriously slow to understand. Change does not occur unless there are consequences. There are three freight trains coming down the track we are standing on (see *Standing on the Tracks*, 3 Entropy, p. 244, *supra*).

- ✓ GGDM is – if I may flatter myself for a moment – a college course in a simulation game. It is as much a treatment of its chosen subjects as a serious book of equal length. In this, it is no different than *Cosmos*, either the book or the television series, episodes of the latter I have viewed in high school and college courses. And I suppose that there is little difference of intent between Carl Sagan and I in our chosen creative projects.
- Still Gorgias: It is possible that recorded historical experience, education and empiricism have somewhat answered Plato's objections to rhetoric in Gorgias (380 B.C.). It seems likely that in mythopoeic culture, people were more likely to believe things simply because they were said, since their entire world was formed in story. Mythic history instead of empirical history, mythopoeic explanations instead of natural observation, etc. This probably extended also into the realm of politics and human affairs. Fame and sociopolitical position (e.g., *arête*, *gravitas*) of the speaker and subject enhanced this effect.

If in fact people are now less likely to believe what they are told, if they are more likely to think critically or seek other evidence and opinion – then they may be less able to be influenced, misled or to have false knowledge created by a sophistic speaker. But this also has a side effect weighing against it, in that it engenders cynicism, suspicion, and hampers communication and understanding. The last historical example of the stark Platonic disaster was Nazi Germany and certainly the world hoped that time had passed. However, this must remain just a theory for now, as the hysterical (and not very funny) rhetorical disaster that was 2015-2017 (and which no media fact checking and levelheaded criticism could derail) set us back decades and remains the relevant evidence at this moment against my hypothesis.

---

*“It is all a matter of time scale. An event that would be unthinkable in a hundred years may be inevitable in a hundred million.”*

– Carl Sagan, Cosmos (1980), p. 73

---

**Tribal Minds**: Even the scale and complexity of human history has become incomprehensible in the view of the average human; our personal scale of history rarely extends farther back than the stories we hear from the youth of our grandparents.

I was surprised and delighted as a teen when I met a WWI vet; he and his wife were approaching 90 years old and I delivered their newspaper in the early 1980s, they were both born within a half-decade of Katherine Anne Porter who died in 1980 at age 90 (I vaguely recall they said they were born in 1894 and 1896, which was a year that didn't have a '19' in front of it... all birthdates I knew started with '19').

Thus, when combined with the human concept of forever in *A Dying Age*, 2 Eras, p. 774, *supra*, the personal human time scale of history extends from approximately our grandparent's youth to our grandchildren's children. See also human time scale discussion in *A Story Without Characters* and *A Story in Unreal Time Scale*, 4 The Streams of Time, both p. 102, *supra*.

- ✓ “Ultimately, I have no illusions that I will last beyond the minds of a couple of generations after me, at best.” – Narrator, “Eventually, Everyone We Know Now Won't Be Known By Anyone,” Pursuit of Wonder YouTube Channel, March 4, 2020.

And of the cities of humanity we may encounter, research shows that at any given moment, we retain memory of about 150 people, according to Prof. Robin Dunbar, researcher in evolutionary psychology at Oxford University, which is approximately the size of a clan in hunter-gatherer societies (or a later modest village), and below the level of a tribe. See, Mona Chalabi, “How Many People Can You Remember?” September 23, 2015, FiveThirtyEight.com.

- ✓ It is also possibly why the most basic unit of military maneuver is the company of 100 to 150 soldiers, the military company-sized unit is the most basic level of true unit cohering/cohesion (e.g., the Roman Cohort of 120 men), while larger units, battalions and regiments, mirror approximately the size and cohesion of a tribe as described by Prof. Dunbar, about 500 to 2500 people (or later a town). *Id.* Human military units developed psychologically along clan and tribal lines.

---

*“One small step for Russia, one giant leap for Communism.”*

– Yuri Gagarin, Cosmonaut, First Man on the Moon (from *The History of Time Travel* (mockumentary, 2014))

---

**Temporal Patents:** The successful prosecution of the Temporal Patent does not depend on any die rolls or Matrix criteria, rather, successful prosecution is solely and arbitrarily at the discretion of the Concierge. In regards to Temporal Patents, the Concierge will err on the side of ultra-cautious preservation of the orderly play of the game without undue delays. The form of the Temporal Patent is not set, however, when submitted to the Concierge, it must contain a careful and detailed description of the game operation of the proposed temporal technology and especially, limitations of the technology and any anticipated problems that might arise during game play of the technology.

- ✓ Thus the Concierge becomes that mythic entity *time itself*, and whether the temporal technology succeeds or not is a personal decision. Role-playing games and fiction writing have strong mythopoeic elements; any game (or creative process) where the game master (or writer), representing the *mythic* universe, has a final say in the game (or work), instead of die roll results as in a straight board game, makes the game master the mythic personification of the universe and any sub-entities, the actions of the game universe are then the personal decisions of the game master (or writer).

*“Time travel? Well, all right, let’s play both sides of the street on this one. Supposing general relativity is in fact right, and we all live on the surface of a hypersphere. If you make the slight additional assumption that the hypersphere is rotating in four dimensions, round its unimaginable center from which it is expanding, time travel into the past becomes instantly possible – all you have to do is drag your feet a little. How much energy it would take to drag your feet I am unable to tell you, but this has been seriously proposed. It could be done. Again, nobody knows in the first place whether the universe is a hypersphere or not, let alone whether it’s rotating, so we are in no position to say with great positiveness that time travel is permanently impossible.”*

– James Blish, [The Tale that Wags the God](#) (1987) (Kindle Loc. 592-597) <sup>16</sup>

## Endnotes.

<sup>1</sup> Commentary: Pirate Den (located in Canada) should not be confused with the infamous Swedish based website, The Pirate Bay, which was raided and its servers seized on orders from a Judge in May 2006.

<sup>2</sup> Citation: Dune Wiki timeline, May 30, 2018.

<sup>3</sup> Citation: Wookipedia canon, various articles on hyperdrive, Coruscant, galactic history, May 30, 2018.

<sup>4</sup> Commentary & Citation: I thought from the movie poster that *The Time Traveler’s Wife* (2009) might be a mushy romcom or melodrama, and you know how much guys hate that. It does get a bit melo toward the end, but how he gets shot is a surprise – though it should not have been because of the earlier hunting conversation (the old rule: nothing should be on the stage in the first act that is not used by the third act). His daughter (and Clare’s determination to have a child) is the epochal future hope from the film, in fact, it is the whole purpose of everything that happened to them, almost as if planned divinely. As usual, the critics weren’t very kind (these are the guys who send each other last years’ stale fruitcake loaf gifts for the winter Holidays) insisting that the movie stay within their predetermined genre boundaries (they don’t handle fuzzy very well), but I thought that Joshua Starnes of coming-soon.com was spot on in his August 6, 2009 review conclusion:

- ✓ “As it stands, *The Time Traveler’s Wife* is decent evening’s entertainment with an intriguing enough premise and some strong heart tugging to keep the women happy and the men from getting too bored.”

<sup>5</sup> Commentary: Suppose I had said, screw this, humanity can simply fall into the abyss for all I care and then deleted all of the files of GGDM and abandoned the project (deletion is necessary so that I don’t change my mind and go back). Humanity may still fall into the abyss, regardless. I certainly didn’t ask to be here, it’s not really fair or right in any way that I have to be on this planet or be alive anywhere and I don’t really care much for humanity?

- ✓ “What moral obligation do you have to those who willfully refuse to open their eyes and deem you mad for seeing?” – Norman Spinrad, [The Void Captain’s Tale](#) (1982).

Two things are certain: that you are reading this means that I did have those thoughts and that I did not – for unknown reasons, decide to delete the files. What meaning you wish to make of it, is up to you. Every author has made that choice, few other than John Milton have dared to ask, and none know why.

<sup>6</sup> Citation: “Why is quantum mechanics like cricket? Because for me, no matter how many times the rules are explained, I can’t seem to get my head around what the game is actually about. Is quantum theory a system of equations? A description of the behavior of invisible particles? A philosophy for the post-post-modern age?” – Kate Becker, “Debating the Meaning of Quantum Mechanics,” NOVA, November 1, 2011.

<sup>7</sup> Commentary & Citation: Examples of time travel games are the board games *Time Agent* (1992) and *Khronos* (2006), both of which I have played, and *Achron*:

- ✓ “*Achron* is a Real-Time Strategy game, with Time Travel as a major mechanic. It is also known as a Meta-Time Strategy game, due to the importance of Time Travel.... As a Time Travel game, *Achron* features a

completely free-form timeline, which is about 6 minutes long by default. Actions can be performed at any time on the timeline, and are propagated either by the players' observations, or by neutral timewaves. User actions are, however, limited to about 3 minutes in the past (on default settings), but units can be chronoported to the unplayable region, and events can be observed at any point on the timeline." – Achron Wiki, "Introduction to Achron," captured June 27, 2018.

- ✓ "Achron is considered to be the first 'meta-time strategy game' (Real-time strategy with time travel), notable for being the first game with free-form multiplayer time travel and its subtle handling of temporal paradoxes such as the grandfather paradox. Achron was released on August 29, 2011.... The unique aspect of gameplay in Achron is the fact that the game proceeds not only in many instances of space, but also in many instances of time. Players can simultaneously and independently play in the past, present, or future. The player can only travel a certain distance into the past – after a while, the timeline becomes permanent." – Wikipedia article, "Achron," captured June 27, 2018.
- ✓ Science fiction writer Mike Resnick is listed as one of the designers.

<sup>8</sup> Commentary: Thanks to the half dozen professionally-written, head-scratching 'timeline' and 'chronology' articles on the internet that have tried to piece together the continuity of the three generations of Planet of the Apes movies. I saw all of the original movies about 35 years ago, I cannot say that I remember them in detail.

<sup>9</sup> Citation: Information was gleaned from review of "Year of Hell" articles Memory Alpha Wiki, May 31, 2018.

<sup>10</sup> Commentary: My top time travel movies are 12 Monkeys (1996), the independent film, Navigator: A Medieval Odyssey (1988), and Frequency (2000). The list probably stretches some technicalities though – I think there is no actual time travel in Navigator and probably not in Frequency, unless you count collapsing timelines. A recent addition to my list of favorite "time movies" is Time Lapse (2014) which is more of a 'time trick' movie (*à la* Frequency). I also found The Time Traveler's Wife (2009) surprisingly good, so that can be added to my slowly growing list. The most recent, late 2019, addition to this list is the faux documentary, The History of Time Travel (2014).

- ✓ I have watched Primer (2004), but I need to watch it again. I have read a plot summary of Looper (2012) and a few other movies that I won't pay Amazon Prime to 'rent' since I already paid a yearly sub fee.

<sup>11</sup> Commentary: Julian May's Pliocene Saga addresses the real world 'Messinian salinity crisis' that was debated in the 1960s and 1970s: One of the psychic-powered characters blasted open the Straits of Gibraltar flooding the Tanu cities in revenge. This provides a literary origin for the 'Zanclean flood' at the beginning of the Pliocene era.

<sup>12</sup> Commentary: Dr. Paul T. Mason, Jr., Duquesne University Dept. of History, opined that we would be bowled over by the 17<sup>th</sup> Century odors as we are now used to living in a world with better standards of cleanliness.

<sup>13</sup> Commentary: If I were to meet a teenage version of myself, I would tell myself to shut up and listen. I really don't think I could stand my teenaged self now. I feel badly for the adults and teachers who had to bear my youth.

<sup>14</sup> Commentary: Again, this is probably the influence of Carl Sagan in my youth, who spoke about our technological adolescence and advance of civilizations. I am a clueless hack who has no new or original ideas.

<sup>15</sup> Commentary: In the Cosmos series Episode 7, Carl Sagan levels scathing criticism at the Pythagoreans and other ancient Greek philosophers for embracing and promoting mysticism; he goes on to blame the loss of the Ionian books, slavery in Athens, just about all human suffering and the fact that we are not currently on our way to the stars on mysticism and religion (see Sagan quote in Morality, 3 Order, pp. 548-549, and discussion in Dark Ages, 1 Technology, p. 686, *supra*). Many have objected to his characterizations of both mysticism and the Middle Ages. Carl Sagan seems to see mysticism as the natural enemy of empiricism and science, he would, as Douglas Adams commented at Digital Biota 2 (1998), "throw the baby out with the water," see quote in Another Duality, 1 Technology, pp. 693-695, *supra*. When I was younger, I am ashamed to say I would have agreed with Carl Sagan, largely because he was Carl Sagan. But given my intuition of parallelism, I would now – while Sagan does have some good points to make – view the Ionian situation differently.

<sup>16</sup> Commentary: If you cannot say with certainty what is possible then you cannot say what is impossible. It is related to truth, if one color is correct, then 15,999,999 other colors are incorrect. But if you can only say one color is incorrect, then there remains 15,999,997 incorrect colors and one correct color.

*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*

[Looking out at a baked, waterless, irradiated Earth with strange pale daylight]

**Clara:** *When are we?*

**The Doctor:** *About six billion years ago. It's a Tuesday, I think.*

\*\*\*

**Clara:** *...Have we just watched the entire life cycle of Earth, birth to death? And you're okay with that?*

**The Doctor:** *Yes.*

**Clara:** *How can you be?*

**The Doctor:** *The TARDIS. She's time. We ... wibbly Vortex. And so on.*

**Clara:** *That's not what I mean.*

**The Doctor:** *Okay. Some help. Context. Cheat sheet... something?*

**Clara:** *I mean one minute you're in 1974 looking for ghosts, but all you have to do is open your eyes and talk to whoever's standing there. To you I haven't been born yet. And to you I've been dead a hundred billion years. Is my body out there somewhere? In the ground?*

**The Doctor:** *Yes, I suppose it is.*

**Clara:** *But here we are talking. So I am a ghost. To you, I'm a ghost. We're all ghosts to you. We must be nothing.*

**The Doctor:** *No. No. You're not that.*

**Clara:** *Then what are we? What can we possibly be?*

**The Doctor:** *You are the only mystery worth solving.*

– Dr. Who, “Hide” (2013)

**Talking to Ghosts:** If you thought you were a time traveler, how would you ever know that you are not just sitting in a room talking to ghosts – imaginary or otherwise – and fully hallucinating the whole experience? H.G. Wells travelled far into the future of English humanity, and never left his seat (at least we think so); his journey was that of his character. What was the difference if it was real or not?

- ✓ What is the difference practically between Dr. Who and being a vampire? His ‘coffin’ is a blue box that flies around to different times (or maybe he is just somewhere dreaming), but everyone is a ghost, a memory. Could you see Peter Capaldi as a vampire? Someone can, because there is an animated video (in a foreign language) on YouTube called “Peter Capaldi Vampire” (I have no idea what it is about since it is language dependent). Or maybe there’s another Peter Capaldi?

**Temporal Ship:** The following sections detailing the Temporal Ship (hereafter “T-Ship”) are an example of an extremely limited and detailed (if not particularly clever) temporal technology that *might* be acceptable in the game.<sup>1</sup> A sample Temporal Ship Patent is not provided.

Nothing comes from nothing. The origin of the Temporal Ship is simple: I started wondering one day what would be the equivalent of submarine warfare in space? The essence of submarine warfare is the ambush, how do you ambush in space? I am sure that Tom Clancy’s books Red Storm Rising and Hunt for Red October were on my mind. I had probably also been reading “Before the Universe” (1940, and its sequels) by Frederik Pohl and Cyril Kornbluth, there seems to be a connection between the two in my recollection. And of course, I am familiar with WWII:

- ✓ “Postwar analyst agreed, however, that the submarine was the weapon that had done the most to conquer Japan. Americans had become so accustomed to a defensive attitude that they scarcely realized how daring and effective their own undersea raiders were. ‘Dud’ torpedoes had been a handicap during the early months of the war; but once the defects were remedied, the blows to Japanese transportation of raw materials reduced the island empire to sore straights by the early months of 1945.” – Lynn Montross, *War Through the Ages* (3<sup>rd</sup> Ed., 1960), p. 961.
- **A Moment of Caveat:** Although many of the following concepts and rules, specifically surreptitious entry and ambush combat, were developed specifically for Temporal Ships, those rules exist independently from Temporal Ships and would be applicable (more or less, with necessary modifications) to any similar situation, such as the development of cloaking and/or stealth technologies by positions during the game.
  - ✓ For example, the “stealth Viper,” the Blackbird that disabled the Resurrection Ship’s engines so that it could not escape, while the two Battlestars attacked and kept the Cylons distracted and destroyed the Resurrection Ship. Battlestar Galactica, “Resurrection Ship, Part 2” (2006).

Back in the real world, scientists have had some impressive successes with “metamaterials” made of nano-particles that can make curved surfaces appear flat to electromagnetic waves (which includes light so they look flat when you look at them from above with bare eyes). Many articles exist on the internet discussing cloaking with metamaterials, e.g., H.M. Doss, “Cloaking – Making Something Appear Invisible,” Physics Central or David Calpito, “Invisibility Cloaks Are Real, And The Military Is Interested,” Tech Times, September 22, 2015.

There are physical limitations to this technology – mainly that objects can be hidden only at certain wavelengths and not at all wavelengths – but there are also some intriguing possibilities. There are also severe size limits, see “Researchers determine fundamental limits of invisibility cloaks,” News Release, University of Texas at Austin, July 7, 2016. Objects have also been rendered ‘invisible’ using lenses only, such as the “perfect paraxial cloak” across a range of angles. See, “Cloaking Device Uses Ordinary Lenses to Hide Objects Across a Range of Angles,” News Release, University of Rochester, September 25, 2014 (the hole in the hand photo is a bit creepy).<sup>2</sup>

---

*“Time keeps on slippin, slippin, into the future...”*

– Steve Miller Band, “Fly Like an Eagle” (1976)

---

**Ghost Probabilities:** The Republic Ghost Ship slipped into the system quietly. Captain Miniwatt smiled in pride at his new command, the prototype warship of a whole new era. It was too easy, if the enemy used stationary detectors, the Ghost Ship simply blinked in and out of time erratically, making the Comarchy (aka “Archies”) operators think that something was wrong with their sensors. If the enemy used roving sensors, it simply disappeared into time and appeared five minutes into the future when the sensor sweep had passed.

The Archies had this coming for a long time, ever since the slaughter of the innocent populations on Anthony Three. Patch up the diplomatic front, put on a smile, and quietly research new warship technologies. Very quickly, the Ghost Ship saw a spherical Archie Colony Ship, probably

leaving to colonize Anthony Three. From the trajectory, the Ghost Ship calculated where it was five minutes earlier and slipped five minutes back into time, to get behind the local colony defenses, moving to intercept the point of departure from orbit.

Suddenly, the Ghost Ship appeared out of no-when over the colony world, at point blank range of the *just departing* colony ship, if the Ghost Ship had had windows, they could have admired the new paint job on the Archie Colony Ship. The Archie designer paint job was suddenly spoiled by a Ghost Ship that wasn't there five seconds ago, alarms went off all over, but were cut short as the Colony Ship came apart from rapid, close-range conventional weapons blasts.

Captain Miniwatt smiled in a way that no one at home would have appreciated, took his prescription psycho awake meds, as the ghost probabilities of the Colony Ship's trajectory came unraveled; it was there, but it was never there. The Ghost Ship slipped away into the future while colony defenders desperately searched for the attacker and sent out panicked communications.

- ✓ The interstellar belligerents in this story were drawn from an article titled, "Stellar Conquest for Two" in *The Dragon*, Issue 36 (April 1980) accompanying a boxed game release of *Stellar Conquest*. The article, written by Steve Jackson, who the editors incorrectly credited as the designer, describes a two-player variant called the Perseid War, between the Republic of Diphda and the Dubhe Comarchy ("Archies"). Perhaps the story in this section is a future version of a never-ending war between interstellar superpowers? Mr. Jackson worked at Metagaming with Howard Thompson, the founder of Metagaming and designer of *Stellar Conquest*, who was also the first editor of their in-house magazine, *The Space Gamer*.
- ✓ A creepy example of temporal being is the Drakh Emissary in *Babylon 5*, "Lines of Communication" (1997) who appeared displaced because it was constantly nano-shifting in time. Video is available on YouTube. Or maybe it's a quantum wave that does not collapse upon observation? A being that refuses to be an eigenstate. See 'quantum eraser' *ut infra*, top p. 822.
- Shadow Memory: The Ghost Ship created a small localized paradox: If the Ghost ship saw the colony ship, slipped back in time and destroyed the colony ship 5 minutes before first seen ... how could the Ghost ship have seen the colony ship in the first instance since it never arrived at that point? Only the crew onboard will remember having sighted the colony ship, as part of their own personal forward moving timelines, only their autobiographical memories hold the paradox together. Just like only you saw the ghost. Take your psycho meds.
  - ✓ [Interview with fictitious science-fiction writer Kevin Ulrich] "We experience time as we perceive it, and if it was being altered, would we perceive that? Would we? That's the big question. Would we even notice?" – *The History of Time Travel* (mockumentary, 2014).<sup>3</sup>
  - ✓ "My memory's cloudy. It's a cloud. Cause my memories aren't really memories. They're just one possible eventuality now. And they grow clearer, or cloudier, as they become more or less likely. But then they get to the present moment, and they're instantly clear again. I can remember what you do after you do it. It hurts ... *But this is a precise description of a fuzzy mechanism.* It's messy." – Joe talking to a younger version of himself over dinner, *Looper* (2012) (emphasis added).

[Interview with fictitious science-fiction writer Kevin Ulrich]

*“With the time machine, the Soviets could have gone back in time and prevented America from ever existing. But they were smarter than that. They realized the danger that if they altered the past prior to Edward Page inventing the time machine, that he might never invent it at all. Recent history, however, would be up for grabs.”*

– The History of Time Travel (mockumentary, 2014)

**Tea Time:** Unlike the regular Era Warships, the Temporal Ship (hereinafter, ‘T-Ship’) Warship System requires two special technologies. The first technology is the Temporal Sensor which allows the T-Ship to realtime scan a short distance into the future and past, and enables the T-Ship’s tactics but at the same time, allows opponents to defend against the T-Ship if they have Temporal Sensors. The Temporal Sensor is a prerequisite technology to the T-Ship technology, which allows short movements of the T-Ship into the immediate past or present, and spatial movement to points within the range of the Temporal Sensor, while protecting the time sense of the crew onboard. It is all very strange. Don’t close your eyes now.

- **Temporal Sensors:** Like sonar and radar, and any other detection technology, it is capable of being used on the offense and the defense. If a Temporal Ship can use the Temporal Sensor to see a short distance into the future and the past, then the Temporal Ship’s opponents can also use it to defend in the same way. It is suggested then, that Temporal Sensors would become a key component of fleet and colony defense, perhaps in the form of a special Temporal Sensor ship, or as expensive permanent enhancements to warships, or in colony defense, as a Technological Device protecting the system. You only need one at a location.

*“In critical moments, men sometimes see exactly what they wish to see.”*

– Acting Captain Spock, ST:OS “The Tholian Web” (1968)

**How to Make Friends Over Tea:** Temporal Ships are warships that have the limited ability to move about in local time, short distances into the future and the past. This gives them a huge tactical advantage over other ships that cannot move about in time and opens whole new areas of combat possibilities. However, T-Ships are very expensive compared to their normal counterparts, and the ability to move about in time takes quite a bit away from their firepower. T-Ships may not be constructed until the Temporal Ship Patent has been successfully completed.

The limitation of localized tactical movement in time is a key component to being an acceptable temporal technology in GGDM; the T-Ship’s time shifting ability is not enough to disrupt the Regular Turn sequence, it cannot undo turns or Power Activations or News Events, it cannot go back to the beginning of the universe. Nor can it erase anything more than five minutes in the past. The entire displacement of the T-ship exists within a single Combat Round.

- **T-Eras:** Theoretically, temporal technology sufficient to make a T-Ship could be available in any Era (after a successful Stardrive Patent), so T-Ships could appear in the 1<sup>st</sup>, 2<sup>nd</sup> or 3<sup>rd</sup> Eras. It must also be assumed that Stardrive does not interfere with Temporal Technology.

- ✓ As noted in Assumptions of Light, 1 Stardrive, p. 781, *supra*, FTL Stardrive (or anything around even half-light speed), implies necessarily some kind of temporal abrogation. The Concierge may also consider 1<sup>st</sup> Era Warship Existential Patent a predecessor requirement for T-Ship.
- ✓ As discussed in Terminus, 1 Temporal Technology, p. 801, *supra*, the 4<sup>th</sup> Era does not automatically equate to Temporal Technology, and thus, Temporal Technology is not specifically limited to the 4<sup>th</sup> Era.

Like Era Warships, Carriers, and Fighters, T-Ships do not receive the benefit of any automatic Era progression, and a new Patent must be designed for each Era of T-Ship. Temporal Ships should be very expensive to construct and strain the limits of most positions.

- T-Bones: T-Ships generally may receive the benefit of all defensive technologies available to their owner, unless they are deemed incompatible with the T-ship technology, for example a cloaking device may require too much power or may interfere with the temporal fields.

Offensively, they receive the benefit of all offensive and weaponry technologies, except that T-Ships may reasonably be prohibited from carrying or using the more potent weapons due to energy or because the weapons malfunction or become unstable in the temporal field; mainly, Temporal Ships will need to use energy conservative and less exotic or field disruptive weapons available in their time.

It's really a question of cost and effectiveness, and how much the T-ship will derail the game. Imagine a T-Ship Death Star? The Death Star is the biggest, baddest, most potent military unit in the Star Wars universe, why would it need to be a T-ship since nothing can stop it from going wherever it wants? But of course, a small T-ship could appear and go right down the uncovered vent with no possible pursuit!

- Dark Tea: Because of the peculiarities of the operation of a T-Ship, T-Ships have one more turn of Operational Flight Limitations (OFL) and Operational Supply Limitations (OSL) than normal ships (see 3 Movement, pp. 855-856, *infra*). However, in order to be resupplied, they must give up their temporal abilities for the Regular Turn or Combat Round of resupply, and become just regular warships, and are thus vulnerable to normal attacks. Unlike normal ships, T-Ships do not automatically reset their Operational Flight and Supply Limitations when they arrive at a supporting colony, thus T-Ships are not automatically revealed.
- T-tection: The presence of T-Ships in a system is never revealed to other positions until they either initiate or join a combat, they are revealed by a Temporal Sensor Array, or if they fail their Surreptitious Entry of the system or took a resupply when others are present.
  - ✓ Most baseball fans wouldn't think about what happens if a player is on base when it is their turn to bat – because it can't happen unless you have less than four kids on each team in backyard baseball. Our backyard games featured lots of 'ghost runners' and were mostly a pitching and hitting exercise with two or three kids on each side and not much room to actually hit the ball. So, I am theoretically standing on second base (in my ghostly image) and at the same time, standing in the batter's box swinging at pitches I can't possibly hit, being thrown from about 30 ft. away. Or maybe it was actually my ghost in the batter's box? Which explains a lot. Someone was supposed to be keeping track of it all, but no one ever really knew the score. There was always a lot of arguing.<sup>4</sup>

*“One particularity of quantum physics, however, is that this smearing, clouding, and rippling doesn’t merely happen over space, but time as well. This can be seen demonstrated in the famous ‘quantum eraser’ experiments, which indicate that quantum particles act as if they go out of their way to avoid paradoxes, in ways which would require they ‘knew’ what happened in the past. There have been countless attempts to explain the strange consistency of quantum phenomenon in these strange examples, but basically, it is as if quantum particles ‘know’ what we are going to do beforehand, and take this into account to make sure they don’t do something which would violate the often already paradoxical seeming, yet nevertheless consistent, laws of quantum mechanics. **In many senses, the paradoxes only arise if we view the quantum world with our everyday, more linearly temporal lenses, similar to the way in which Looper appears inconsistent from a more traditionally linear temporal point of view.**”*

– Christopher Vitale, “Collapsing the Fuzzy Wave: Rian Johnson’s ‘Looper’ (2012), Quantum Logics, and the Structures of Time Travel Films,” networkologies (blog), written in 2012, updated and reposted, October 31, 2014 (emphasis added)

**What to do with Paradoxes:** Indeed! A ship was destroyed at 11:00 a.m. because it was sighted by a T-Ship at 11:05 a.m. Every time a T-Ship attacks (or even acts) it creates a paradox, even if the target is not destroyed. The sorts of paradoxes created by T-Ships exist in two parts, the T-Ship crew who remembers things that never happened, and the location where the attack occurred. Any time the Concierge detects that a paradox has occurred, it should at least be recorded, in pairs, the location and the actor. If the T-Ship survives the action, it will invariably move away, both spatially and temporally from the site of the act, and eventually leave the system probably. The two points, however, should probably be considered to remain connected.

- ✓ Merriam-Webster online dictionary at *paradox*: **2:a** a statement that is seemingly contradictory or opposed to common sense and yet is perhaps true.

The preceding discussion is one that is seemingly contradictory or opposed to common sense, yet is perhaps true. A temporal paradox is created by causality running against the direction of time. For example, if an enemy ship were spotted at 11:00 a.m. and destroyed at 11:05 a.m., that would be just normal intercept and destroy combat. It is the unidirectional experience of time that creates the paradox; consider then the situation with the Chinese general at the end of the movie *Arrival* (2016)? A pre-cognitive or post-cognitive psychic is a walking temporal paradox.

T-ships are capable of creating paradoxes (and general cosmic havoc) without attacking other ships or anything else. The list of situations is probably endless, but an example might be if the T-Ship were sent to surreptitiously extract an agent from an alien planet. The T-ship spots the agent’s fleeing ship because it is being pursued by enemy patrol ships. The T-Ship slips back in time, and intercepts the agent’s ship before it is spotted by enemy patrol ships, rescues the agent and slips away. Have a nice paradox day.

- ✓ The card game *Chrononauts* features an “Uber-Paradox” in which, if WWII occurs as a result of the Cuban Missile Crisis, all of the subsequent history is wiped out. What makes it a paradox is that all of the player’s agents were born in the subsequent history and thus could not exist, but do. All of the player’s agents, except one, that is: One of the player agents is an intelligent time-travelling cockroach from the future, whose species survived and were raised to intelligence by the nuclear war, so its objective is precisely to cause WWII and erase the other timeline. GGDM is not, of

course, designed for that sort of play, whereas, Chrononauts is... it's like trying to turn a straight head screw with a hex wrench. When I was young, I used to hear frequently that only cockroaches would survive WWII because they are radiation resistant, how many kids know that now?

- Cosmic Conundrum No. i: The Concierge should note all paradoxes, but what happens or doesn't happen as a result is entirely within the purview of the Concierge. We are after all in the outermost limits of science-fiction territory, bordering on the lands of horror, irony, manic, hysterical and mystical. Perhaps there might be an effect on the crew who remembers things that never happened (are they nuts)? Or perhaps it just doesn't bother sapient that much? Most likely, machine intelligences would not handle paradoxes well.
  - ✓ This is the explanation given in the sequel 2010: The Year We Make Contact (in which Kubrick had no interest), for HAL 9000's behavior in 2001: A Space Odyssey – that HAL 9000, who is incapable of error, was ordered to lie – to provide incorrect information – to the crew of the Discovery One about their mission to Jupiter. This causes HAL 9000 to begin making errors and act irrationally; the AI computer has a paranoid mental breakdown.

Perhaps the location of the attack becomes some kind of rift or anomaly in space, does it move and grow, or can it be marked and avoided? If it is a marked place to be avoided, some nutjob will try to go there (like kids who sneak into a haunted house<sup>5</sup>), perhaps looking to change their own past, speak to the dead, or pry a mystical secret from the universe. Does the paradox or multiple paradoxes eventually effect the planet or starsystem? Maybe a temporal paradox is like a rock sticking out of the water interrupting the flow of time on the surface of the hypersphere?

- ✓ “Time travel is damage, it's like a tear in the fabric of reality. That is the scar tissue of my journey through the universe. My path through time and space. From Gallifrey to Trenzalore.” – Dr. Who, “The Name of the Doctor” (2013)<sup>6</sup>

Ha! You thought I was going to tell you what to do about temporal paradoxes in GGDM!<sup>7</sup>

- ✓ Two examples of non-temporal paradoxes are the famous Zeno's Paradox and the Dishonest Person Paradox. The latter shows that when a dishonest person is honest, he does not become an honest person, whereas an honest person who sometimes is dishonest, is labeled as dishonest.
- Cold Case: We all look back on our lives, remembering things that happened a generation ago, or when we were children, or, for some, remembering acts of two generations ago. The television series Cold Case (2003-2010) played to this, Cold Case was about regrets. Obviously in looking back on events, we have a much different view of the events now than we did 10, 20, or more years ago; we see the situation or acts more clearly now. Ours is, according to some interpretations of physics, simply one of many possible time lines, each branching off from each decision (e.g., Many Worlds Theory). Some acts we are proud of, some we regret very much as the years wear on (regardless of our reasons at the time), and some that were good turn to bad, and some that were bad now seem harmless.

Imagine for a moment that the loop could be closed just a bit, that for a moment in the past, we have then the understanding of our acts or situation as in the present, a moment of clarity.

- ✓ “Telling Cid to run into the cane field, Sara stands between Old Joe and her son. Realizing that Sara’s death will turn Cid into the Rainmaker, Young Joe commits suicide, erasing Old Joe’s existence, saving Sara and preventing Cid from becoming the Rainmaker.” – from Wikipedia article, “Looper (film),” captured October 27, 2019.

Of course, if that changes the act in the past, then it changes the future, and that would be a paradox (unless it was all predestined, which is suggested by the heptapod writing in *Arrival* (2016)). But it would also be a step toward perfection in each iteration of the past-future closure. Dr. Who keeps this process compartmentalized by keeping the personal timelines of each successive Doctor separate and suppressing memories of previous Doctors, but that’s kind of a cop out. Perhaps the closure I describe here is the human version of the heptapod continuum-language in *Arrival* (2016)? The trick with *Arrival* is that the viewer thinks they are viewing the movie in normal forward time – that Dr. Banks’ daughter had died before the movie.

- ✓ “I read in an interview or article, I believe it was Rian Johnson discussing his film *Looper*, that time travel is messy and that no matter how hard you try there are going to be plot holes, loose threads or paradoxes. Time travel by its very nature is not logical, it’s impossible to make something illogical into something logical. So the idea with a time travel story is to make it seem like its logical, at least for the duration of the film’s running time. If I’ve done my job well you will suspend disbelief and just accept the story.” – Rickey Kennedy interview, Dylan Levy, “AFF Interview: Writer/Director Ricky Kennedy, *The History of Time Travel*,” October 20, 2014.
- Wir müssen wissen – wir werden wissen: My thinking about how to define emergences has lead me to the same idea as paradoxes; that they are emergences only when viewed through our limited linear temporal lens (that is, ‘barrier’). It is also the same problem as quantum physics, it is one of framework. If this makes sense, then emergences share some of the same traits as paradoxes. To some people, that makes the problem automatically unsolvable (*Ignoramus et ignorabimus* – Emil du Bois-Reymond) but I think it is worth at least a book length dissertation (that no one will read). What if emergences are the results of paradoxes that we cannot yet comprehend or see? How else would a paradox resolve? Thus, the succession of fracturing of the universe described previously (see *Order of Genesis*, 1 Order, p. 522, *supra*; *Fourth Frame*, 1 Entropy, p. 226, *supra*) is likely ‘baryon-like’ groups of paradoxes, though I am not sure which came first, did the paradoxes cause the fracture (as suggested in *Big Bang Theory*, 1 The Big Bang, p. 2, *supra*) or vice-versa? Perhaps it was a feedback loop?
  - ✓ The 44-minute sci-fi short film, “Destroyer of Worlds” by Samuel Dawes (The CGBrothers, June 30, 2019) presents a very interesting vision of a paradox: The dictatorial time-travelling regime of the future encountered a ‘barrier’ that was ‘rapidly approaching’ from the future, which they could not leap past. They kidnapped the man who invented the equation leading to time travel (and his son as a hostage) to solve the barrier problem. What they did not realize was that the ‘barrier’ was the paradox of their own existence: due to an event in the past which they inadvertently created, their future timeline would terminate at the barrier when it reaches their current time. The barrier idea is nicely intuitive to those of us who experience time in a linear way. I highly recommend the video.<sup>8</sup>

- ✓ I have tended to favor ideas which are illustrative and intuitively grasped, for example, Mr. Case's four orders of natural phenomenon, or the paradox as a time barrier, *ut supra*. In physics, this would be evidence of an ignorant mind, of my childish intelligence, as physics discarded the necessity of intuitive-illustratability at the Bad Nauheim Debate in 1920; illustratability was a barrier (of our limited physical existence) which physics had to leap beyond to become modern physics.<sup>9</sup> Modern physics is a skyscraper built of mathematical concepts and the debate on that issue is closed in physics, except for science educators (e.g., Kate Becker) who are trying to find a way to explain it to the public and science-fiction authors who are trying to tell a story.

*“Maybe you just clean carpets. If you do, you're lucky. You're gonna live a long, happy life. But if you other guys are out there, if you're picking this up, forget about the Army of the Twelve Monkeys. They didn't do it. It was a mistake. Someone else did it. The Army of the Twelve Monkeys is just a bunch of dumb kids playin' revolutionaries. Listen. I've done my job. I did what you wanted. Good luck. I'm not coming back.”*

– Cole (Bruce Willis), *Army of the Twelve Monkeys* (1995)

**The Cole Loop:** Cole knows they are not going to “live a long happy life”; the pandemic is starting. The Cole loop is a classic, the protagonist Cole, as a little boy going through airport security with his parents, saw his future-self killed in the airport terminal. Therefore, he became a fixed point, of sorts, he could not die of the global pandemic that killed his parents and 95% of humanity in a year or two – because he had to survive to be sent back in time and killed in the airport as an adult. But at the same time, he apparently didn't know or remember seeing himself killed, or what happened at the airport, otherwise, his adult self might not have gone to the airport that day.

- ✓ The Army of the Twelve Monkeys didn't do it, but they inadvertently provided the opportunity, they were the agents of chaos, the historical accident that tilted the system.

*“If you object to the notion of 14<sup>th</sup>-century villagers finding a way to travel forward in time 600 years...well, in the present day, we haven't invented time machines either.”*

– Gavin Edwards commenting about *Navigator: A Medieval Odyssey* (1988), “Future Tense: The 20 Best Time-Travel Movies,” *Rolling Stone*, May 20, 2014

## Endnotes.

<sup>1</sup> Commentary: I believe that I must have designed the Temporal Ship technology sometime in the summer of 2001, as I cannot find any reference to it in the old game files before that time (my current game design files in MS Word only go back to early 1999). I started designing this game in early December 1992 using a program called 1<sup>st</sup> Word on an Atari 1040ST machine that I had bought in the summer of 1989. I also spent thousands of hours playing Time Bandit on my Atari using keyboard arrows and the space bar as controllers. I had to convert the burgeoning game files to ASCII format and save them to disc in October of 1997 when I moved and left my old computer behind. From the fall of 1997 to approximately June 1999, I designed this game on a Brother notebook, and in June 1999 converted the files again to ASCII format to bring them over to my new generic no-name Windows 95 PC (from a

mail order company in Texas) where they were converted to MS Word documents. The Word documents have progressed continuously through MS Word/Office versions to the current time thanks to backward compatibility.

<sup>2</sup> Citation: <http://www.rochester.edu/newscenter/watch-rochester-cloak-uses-ordinary-lenses-to-hide-objects-across-continuous-range-of-angles-70592/>.

<sup>3</sup> Commentary & Citation: The History of Time Travel (2014, written and directed by Ricky Kennedy) which I found on Amazon Prime by accident is a movie that should have won major awards (it won a few film festival awards), but barely even registers in Google searches, which translates approximately to it was barely noticed (since Google is always geared to what is popular). It received only a 6.7 on IMDB, much less than many other louder dumber big budget movies. It is almost conspiratorial the silence surrounding this faux documentary or mockumentary... As you can guess, I highly recommend seeking out this intelligently-made film and watching it when you are alone and can pay close attention!

- ✓ I added the director's name above because that slightly improves the Google search results. I found a few minor reviews (i.e. no major film critics) and the following interview from the Austin Film Festival 2014: <https://austinfilmfestival.com/news/2014/10/20/aff-interview-writerdirector-ricky-kennedy-the-history-of-time-travel/>. Otherwise, there is no discernable internet discussion (some reviews, no forum discussions) of this clever movie gem five years later, even from the time when it was first released.

<sup>4</sup> Commentary: The one time I actually was standing on the cardboard piece that was second base, I took a baseball in the eye. The batter got mad at the pitcher and threw the ball as hard as he could back at the pitcher, who ducked out of the way. The batter and pitcher were brothers, and second base, where I stood not paying attention, wasn't far behind where the pitcher stood.

<sup>5</sup> Commentary: I enjoyed Stephen King's Rose Red miniseries (2002). Also, there is a scene in one of Stephen King's Dark Tower books where Roland, Eddy and company sneak into a haunted house; the haunted house tries to eat them. Yeah. Because, you know, it's a Stephen King book. 😊

<sup>6</sup> Commentary: More than most Dr. Who episodes – in which the TARDIS is just a transport box to a past or future on Earth, a place or time related to Earth, the present Earth, or to some distant planet at an unknown time – the two-part story told in “The Silence in the Library” and “Forest of the Dead” (2008) is a true time-travel story. Dr. Who meets his future wife, Riversong, daughter of future companions he has not yet met, on the day she ‘dies’ in the library. She knows him, he doesn't know her, having never met her in his personal timeline, and she has his sonic screwdriver from the future, which he does not understand. In the end, to save her essence into the datacore, he must figure out why his future-self gave his future-wife his sonic screwdriver – he never gives anyone his sonic screwdriver (there is probably a ribald joke in there...) – he has to solve a problem that he doesn't even know about yet, but that his future-self solved in hindsight with all the time in the universe to think it.

- ✓ “Everybody knows that everybody dies. But not every day. Not today. ... Some days are special. Some days are so, so blessed. Some days, nobody dies at all. Now and then, every once in a very long while, every day in a million days, when the wind stands fair, and the Doctor comes to call. Everybody lives.” – Riversong end narration, Dr. Who, “Forest of the Dead” (2008).
- ✓ “Everybody Lives” is a reference to the end of the Dr. Who episode, “The Doctor Dances” (2005). It also relates later to Riversong's lecture of Dr. Who at the end of “A Good Man Goes to War” (2011) showing the increasingly hostile arc of the main character from 2005 to 2011. The “Pandorica Opens” (2010) was an earlier warning in the character arc.

<sup>7</sup> Commentary & Citation: In the B-grade movie The Time Travelers (1964), four people from 1964 are placed via time portal (probably the inspiration for Star Trek's “City on the Edge of Forever” (1967)) 107 years in the future, in the year 2071 where mutants roam a dying planet following catastrophic global thermonuclear war. Notably the time travel did not involve any spatial movement; they landed on the same spot on Earth in the future (ignoring the obvious problem with orbital mechanics). They discover an underground civilization of technologically-advanced normal humans, and about halfway through the movie (which is *twice* as long as it needed to be), it is finally resolved to construct a time portal back to their time and warn the world so that this doesn't happen.

*Finally, one of the smarter scientists mentions the obvious paradox.* However, such a paradox depends on whether they are successful in preventing the events that caused the bad future. Perhaps they can go back but will be ignored, ridiculed, shunned and the war happens anyway? Maybe the universe changed and they cannot replicate the results of their initial experiment or explain why it worked? The paradox depends on perfect communication and

2 Temporal Technology – Temporal Ship

absolute effectiveness (e.g., as in horse betting results, like in the 2014 movie *Time Lapse*, but this is not quite the same type situation), both of which are non-existent in this universe. Or perhaps they inadvertently cause the war through their radical ineffectiveness at trying to prevent it? Perhaps they are the founders of the group of “far thinking scientists” mentioned in the dialogue (a common idea of the time, e.g., *Ark II* (1976), *Logan’s Run* (1976), *The Morrow Project RPG* (1980), *Jeremiah* (2002)) who established the Colony which will launch the starship in 2071?

- ✓ The movie, the usual preachy mid-60s sci-fi movie (it was either that or creature features), tries too hard to portray the future humans as normal, industrious and likeable (and tries ineptly to inject humor and romance) while ignoring the obvious: Why don’t they use androids to build androids instead of humans doing the job – the movie shows the androids constructing the time portal components later and packing supplies to go on the ship. And how are they going to fit everyone into that small ship – meaning that the majority of the population, the workers building the androids by hand, will be left behind to die or be slaughtered by the mutants and apparently they accept that? The film is ambiguous on that point, understandably. The movie throughout screams of stark Aristotelian class division (see *Echoes of Aristotle*, 2 Colleges, p. 474, *supra*): The cloister of brilliant, educated scientists upon whose future humanity depends naturally rule over everyone else (i.e. the non-scientists workers) who are vaguely bestial, happy-go-lucky, and mindlessly compliant. And they are going to brute force launch a starship from the surface of the Earth to Alpha Centauri? Yay!
- ✓ Of course, the movie never gets to that point – you saw it coming, the mutants break in just as the ship is ready to launch and the portal ready to operate. The android defenders are incredibly impotent and the scientists are inept and uncreative in defending. The special effects of the ship failing to launch and falling over (with people onboard) are underwhelming, either because lack of knowledge (e.g., the Nedelin catastrophe in 1960 and this movie was made before the Soviet N-1 Rocket fell back to the pad on July 4, 1969) or just because they didn’t have the money and technology. The defenders are left with just the time portal to escape the attacking mutant invaders (a slaughter that bears similarity to the later *Beneath the Planet of the Apes* (1970)) – and this is where the movie takes an interesting, unexpected turn!

<sup>8</sup> Commentary: Most of the intelligent, well-thought-out science-fiction literature comes from outside of Hollywood and is made on relatively low budgets. I especially prefer to watch indie and foreign-made time-travel stories. The economics of Hollywood is the barrier which it has not been able to penetrate – *Mad Max* director George Miller pointed this out in his 1985 interview with Anne Billson, and 35 years later they still have the same problem, but now, YouTube has given young writers not-of-Hollywood a place to play with ideas on low budgets, in addition to the already growing indie film production companies and the growth of other non-theatre or television video streaming services (e.g., Amazon Prime, HBO, Netflix, Hulu, etc.). This barrier may eventually and currently is, extinguishing Hollywood ‘as we know it’ forcing the market to adapt.

- ✓ I had an executive friend long ago who had an advanced degree in economics; he was also an aspiring board game designer who kept track of the number of hours he spent on his game design projects. One day during a car ride, around perhaps 1993 or early 1994, he asked me how many hours I had spent on my ‘game design’ (which at that point was an ‘advanced *Stellar Conquest*’ rules set) and I had no idea. And that was over 25 years ago. I always felt the limit with his approach to game design was that he cared about how many hours he worked on it, his problem was overthinking the economics. Had GGDM been made with the same approach (or with the approach of in-house game company ‘works made for hire’ by salaried employees), it would not have ever been finished, there would have been deadlines, time tracking.

<sup>9</sup> Citation: “I would like to say, that what humans consider as illustrative or not, has changed. The view about illustrativeness is so to speak a function of time. I’m of the opinion, that physics is conceptual, not illustrative. As an example for the changing view about illustrativeness, I remind you of the view on illustrativeness of Galilean mechanics in different periods.” – Albert Einstein at the Bad Nauheim Debate in 1920 ([https://en.wikisource.org/wiki/Translation:The\\_Bad\\_Nauheim\\_Debate](https://en.wikisource.org/wiki/Translation:The_Bad_Nauheim_Debate)).

- ✓ “Thus one cannot use such a changing concept for or against the theory. ... To let decide the ‘common sense’ in this question, is no less problematic as it was before in respect to illustrativeness.” – summary by K. Körner. *Id.*

*“A method for employing sinusoidal oscillations of electrical bombardment on the surface of one Kerr type singularity in close proximity to a second Kerr type singularity in such a method to take advantage of the Lense-Thirring effect, to simulate the effect of two point masses on nearly radial orbits in a 2+1 dimensional anti-de Sitter space resulting in creation of circular timelike geodesics conforming to the van Stockum under the Van Den Broeck modification of the Alcubierre geometry (Van Den Broeck 1999) permitting topology change from one spacelike boundary to the other in accordance with Geroch’s theorem (Geroch 1967) which results in a method for the formation of Godel-type geodesically complete spacetime envelopes complete with closed timelike curves.”*

– Abstract, Method of gravity distortion and time displacement, US Patent Publication No 20060073976 A1, retrieved from Google Patents (<https://www.google.com/patents/US20060073976>) on October 20, 2017 <sup>1</sup>

**“Violating Laws of Man & Nature”:** ←I got that from a Superman movie... *GGDM Patents are different from real world patents:* You must have the patent before you can build it, it is assumed to be useful, and it can violate just about any scientific laws desired, because GGDM is – after all is said – a space-opera setting! Let the tom cats sing!

*“As our knowledge expands what was formerly science fact frequently becomes science wrong, sometimes badly wrong. Does that mean that someday perpetual motion will be a reality? Who knows. I am not holding my breath or taking any bets, but there are a lot of highly intelligent people constantly trying to unlock the mysteries of the universe and with so many new discoveries it seems science continues to encroach upon the impossible. Just think about cloaking devices and a transporter a la Star Trek, which are already to some extent realities.”*

– Gene Quinn, “The Patent Law of Perpetual Motion,” IP Watchdog, October 11, 2011 <sup>2</sup>[Full Quote]

**Surreptitious Entry:** One of the primary abilities of the T-Ship is its ability to enter an occupied starsystem undetected and wait hidden for the perfect opportunity to attack. Upon arrival of the T-Ship at a destination system the T-Ship must attempt a Surreptitious Entry of the system.

The Surreptitious Entry attempt is made even if the owner of the T-ship does not intend to enter surreptitiously. It is the nature of T-ships. If it is desired to reveal the presence of the T-Ship, the owner can subsequently do something that would reveal its presence in the system. As discussed *ut supra*, T-ships do not automatically resupply when upon arrival at a supporting colony (see Free Resupply, 3 Construction, p. 678, *supra* and Supporting Colony, 1 Movement, p. 840, *infra*), so are not revealed.

- **Riding the T:** The basic chance of a successful Surreptitious Entry is 50%. Ten percent is subtracted from the base chance if the T-Ship by entering the system is also exploring the system for the first time, and the base chance is increased by 20% for a 2<sup>nd</sup> Era T-Ship and by 40% for a 3<sup>rd</sup> Era T-Ship.

A separate Surreptitious Entry roll must be made for *each* T-Ship entering the system, *each time* the system is entered surreptitiously. A successful Surreptitious Entry result means that the T-Ship has entered the system without alerting those already in the system (if any), and thus others present will not be informed of the arrival of the T-Ship; failure means that the T-

Ship has been detected and its arrival must be announced to anyone with ships or colonies currently in the system.

- ✓ The detection rules in GGDM are very generous; in reality finding a ship (unless it is planet sized or bigger) in system space is a needle-in-a-haystack endeavor. However, we must assume detection abilities have advanced as much as the rest of technology in the GGDM universe; if we can have FTL speed, then we can have generous system space detection abilities. See also ABBA Arrival, 2 Information, p. 1340, *infra*.
- Twilight Presence: In many cases, a ship with a ‘cloaking device’ can do approximately the same as a T-Ship, but never quite as well. A ship with a cloaking device *may not* Surreptitiously Enter a system, however both T-Ships and ‘cloaked’ ships may remain undetected in a system if they arrived before anyone else currently in the system, *or if the T-Ships were successful in a Surreptitious Entry of the system*, and are currently within their Operational Supply Limitations (OSL). T-Ships and cloaked ships that are beyond their Operational Supply Limitation and who must receive supplies from other ships or colonies may not maintain a surreptitious presence in the system if anyone else is present when they are resupplied, but may remain in the system if they are being supplied and may use Ambush Mode in combats if they are warships (cloaks could also conceivably be used for non-warships).
  - ✓ Cloaking is never as good as time shifting for avoiding detection – because the ship is still there behind the cloak. It might also be assumed that cloaking doesn’t work at FTL speeds (except apparently in Star Trek, see DS9 “The Die is Cast” (1995) information from Memory Alpha wiki), though GGDM does not generally provide for FTL tracking. This is intended to be a rule that must be incorporated into any Patent for a Cloaking Device.
- Trip Wire: A surreptitious presence may not be maintained if anyone attacks any Friendly or Naturalized colony (except Raid or Strike, see World In Flames, 4 Carriers & Fighters, p. 1083, *supra*), the Capital Colony,<sup>3</sup> or any Colony Ships or Cargo Ships<sup>4</sup> owned by the owner of the ships maintaining a surreptitious presence in the system.
  - ✓ If the attacker commenced a Colony Combat against a colony on the belief that there were no warships in the system, and there are warships surreptitiously present in the system, the Colony Combat is cancelled and automatically becomes a Ship Combat between the would-be attackers and the ships whose presence was previously hidden.
  - ✓ If a:
    - 1) Ship Combat is initiated or ongoing in a system, or
    - 2) A Colony Combat is initiated against any colony that is not described above (including non-sovereign colonies), the T-Ships and/or cloaked warships *may join* the Combat at the beginning of any Combat Round.
  - ✓ If the owner of the hidden ships was not already a participant in the ongoing Combat, the Combat Power must be activated to initiate combat as described in Those Who Stand Looking, 3 Combat, p. 973, *infra*. They may also remain out of the Combat indefinitely but may later be automatically forced to intervene as described above.

T-Ships and cloaked ships are particularly effective in combination with the Combat Alert purpose of the Combat Power activation.

- **Crossing the T:** T-Ships or cloaked warships which are in a system surreptitiously or which enter a system surreptitiously may initiate any combat against any other known unit or colony in the system as if they were normal warships. All normal procedures are followed for the combat, however, the attackers may be considered in Ambush Mode (see 7 Combat, p. 1038, *infra*).

---

*“Atom (obsolete): The smallest mediaeval unit of time, equal to fifteen ninety-fourths of a second.” – Wikipedia*

---

**Time to Get Medieval:** Easter is a solar-lunar holiday in the Julian calendar tradition, and its drift also part of the reason for the Gregorian Calendar, introduced in 1582, the most widely used civil calendar in the world.

- ✓ “The atom was a unit of time referred to in medieval philosophical writings as the smallest possible division of time. The earliest known occurrence in English is in Byrhtferth’s *Enchiridion* (a science text) of 1010–1012, where it was defined as 1/564 of a *momentum* (1½ minutes), and thus equal to 15/94 of a second. It was used in the *computus*, the calculation used to determine the calendar date of Easter.” – Wikipedia (Easter, 2016).

---

*“It’s sort of a funny question isn’t it, asking how we want to be remembered after we are gone. No one knows how they are remembered, nor does anyone ever experience it. Yet for some reason, we still ask ourselves these kinds of questions. It’s a paradox really, to want something after I am dead, but to only be able to really want anything while I am alive. The question is really more about what I want to imagine while I am alive, isn’t it?”*

– Narrator, “Eventually, Everyone We Know Now Won’t Be Known By Anyone,” Pursuit of Wonder YouTube Channel, March 4, 2020 <sup>5</sup>

---

**The Insistence of Memory:** The ability to be elsewhere – in memories, or anticipated futures, or literary construction of places and times (and memories of those literary places, people, and times) that have never existed and never will – of suspension of disbelief – is a key element of sapience. One of the primary mental abilities of humans is to be somewhere else, somewhen else without moving – we call it dreaming, foresight, projection.<sup>6</sup> This is the basis of *Dune*’s (1965) navigator guild, the ultimate form of moving without moving.

- ✓ Since I have observed cats in twitchy REM sleep on my lap, are they also sapient, dreaming of pouncing, chasing, fighting? Sapience then is a gradual fuzzy thing that dawned over life through evolution, through time, not a zero or one, on or off thing.

A friend of mine states that “everyone wants to be remembered.” I disagree. Can anyone make a case for the statement?

Wanting to be remembered should not be confused with the fact that *we will be remembered* (for a short while), by virtue of our existence and causality, whether we want to be or not.<sup>7</sup> If the argument is being offered that everyone wants to leave a legacy (“to be remembered”), legacies don’t need names.<sup>8</sup> Does anyone remember who invented bread? Democracy? The sword? No, but it is part of our culture, legacies without a name. We know the names of one millionth of one percent of the billions of Anatomically Modern Humans who have lived. Some, we know only

names from references in ancient manuscripts and not much else. But our civilization is their legacy, without names attached.

- ✓ Prof. Antonio Damasio (Dept. of Neuroscience, University of Southern California), “has suggested that consciousness, whether the primitive ‘core consciousness’ of animals or the ‘extended’ self-conception of humans, requiring autobiographical memory, emerges from emotions and feelings.” (Jason Pontin, “The Importance of Feelings,” MIT Technology Review, June 17, 2014).

Legacy is a product of the *extended self-conception* of human consciousness and *autobiographical memory* (and perhaps sapience), it is the idea of our self beyond our self, and beyond our inevitable death. It is our attempt to leap the barrier of our own mortality. It is through existential vanity (feelings) only that we need to attach our name (which will be meaningless anyway in two generations hence) to our legacy, having our name attached to something extends an illusion of autobiographical memory beyond death. Filmmakers love to use this trick at the end of films where the hero died but his memory lives on in place names (e.g., the Gordon Memorial College and Kitchener School of Medicine in Khartoum).

- ✓ “Perhaps being remembered isn’t that important after all if most people are not remembered for what is important.” – Narrator, “Eventually, Everyone We Know Now Won’t Be Known By Anyone,” Pursuit of Wonder YouTube Channel, March 4, 2020.

Suppose for a moment that my name were attached to this work as the author, and some future historian developed a cockeyed theory that I am not the author of this original work, that I didn’t spend a lifetime writing it, and that some sapient AI wrote it or that I channeled alien or ancient intelligences, or that my cats actually wrote it in quantum time. Does it matter, or do the concepts matter?<sup>9</sup> Historians spend a lot of time arguing about trivial things and don’t often stop to wonder why it matters this or that, in the age of scientific empiricism, historical accuracy and absolute chronology have become the life of history by themselves.

- ✓ “I may remind you that history is not a branch of literature. The facts of history, like the facts of geology or astronomy, can supply material for literary art; for manifest reasons they lend themselves to artistic representation far more readily than those of the natural sciences; but to clothe the story of human society in a literary dress is no more the part of a historian as a historian, than it is the part of an astronomer as an astronomer to present in an artistic shape the story of the stars.” – J. B. Bury, “The Science of History,” *Selected Essays*, 1930 (text available on Google Books).

My legacy doesn’t need my name attached and thus I do not need to be remembered. Wouldn’t it be interesting if history were taught without names? Professor Moon H. Jo, who taught my Criminology class at Lycoming College, said this to me one day; that I was good at Criminology because I focused on concepts, and not on memorizing names, dates and theories like many other students. If history were taught without names, the focus would have to be on concepts; grade school test questions such as, ‘Who became Emperor of France in 1804?’ would be obsolete.<sup>10</sup>

- ✓ We honor our ancestors and the forefathers of the branches of our knowledge for their achievements. So what. They are dead, what does it matter to them? No, these honors, like funerals for loved ones, are for the living, the now, to provide history and context and remembrance, to shield us from glimpses of the Existential Void. They also allegedly inspire youth to excel and change our world, but there we run into a

mire, because at the same moment, intelligence and education are ridiculed, and simple-mindedness, fun, recreational drugs, and ignorance are promoted instead.

However, I do admit that evolution has left us with more than a bit of personal vanity with which we have alternately struggled and indulged, leaving grave markers (some bearing ‘*Eram quod es, eris quod sum*’ inscriptions),<sup>11</sup> statues and named buildings and streets. Additionally, being ‘remembered’ is also a necessity, to those who come after, in sovereign situations where legitimacy and authority depend on invoking continuity (e.g., Napoleon III of France),<sup>12</sup> to remind people who has been in charge for generations, or the spiritual authority of war heroes and philosophers, such as in modern religions and war memorials.<sup>13</sup> But we don’t know those people for who they were, all information about them is bent toward what they did, not what they wanted or felt.

- ✓ I might, for all I know, be related to Attila the Hun, but I would never claim it even if I did know for certain as it would be completely pointless self-puffery.<sup>14</sup> There is a form of mystical genetic legacy claims that drive me nuts. I had a stepfather who claimed to be ‘part Cherokee’ – probably total BS, a common BS line of many men in the 1960s and 1970s – which he apparently felt gave him an edge of intimidation and mystical ability. There was in recent years an advertisement for one of the online ancestry sites where a woman is holding a large portrait of George Washington, and it proudly proclaims that she discovered that she is a descendant of George Washington through the website. *So what.* It makes no difference in who *you* are.

No, the greatest legacy is not in having your name attached or remembered; the greatest legacy is in having the next generation stand on your shoulders (to be stood upon ☺), not ride on your shoulders (though riding on shoulders is ok while their age is still in the single digits). GGDM stands, for better or worse, on the shoulders of nameless multitudes.

- ✓ “To live for or care about being remembered is like planning your own birthday party on a day that you can’t go.” – Narrator, “Eventually, Everyone We Know Now Won’t Be Known By Anyone,” Pursuit of Wonder YouTube Channel, March 4, 2020.
- ✓ Hypatia of Alexandria defeated the ‘Saints’ of her time who would have completely eradicated the works of a pagan female teacher, mathematician and philosopher just for being such; she hid some of her original commentaries in texts she edited and that were published in her father’s name. For all of those millennia, only the concepts were important because no one thought badly of texts edited by her father (or bearing his name anyway), even though he also was also a pagan politician.

Endnotes.

3 Temporal Technology – Surreptitious Entry

<sup>1</sup> Citation: If your head hasn't exploded yet just reading the abstract: Continuing previous citation ... "The present invention relates to the use of technical time displacement devices, which operate by the modification of gravitational fields. These drive systems do not depend on the emission of matter to create thrust to take advantage of time dilation, but rather create a change in the curvature of space-time, in accordance with general relativity. This allows travel across topologies by warping space-time, to produce a topology change from one spacelike boundary to the other in accordance with Geroch's theorem (Geroch 1967)."

- ✓ Is this patent describing the Alcubierre warp drive?
- ✓ I assume that the Patent Office employs someone who can understand this?

<sup>2</sup> Commentary & Citation: "As a result, the district court referred the device for testing by the National Bureau of Standards ('NBS'), which all things being considered was a really good idea. After all, if one is going to say that the first law of thermodynamics is incorrect it might be a good idea to actually test the device and see if the claims and paper proof really add up to a real-life illustration of the faulty nature of the first law of thermodynamics.... What does this all mean? It means that it will be exceptionally difficult to obtain a claim on an invention that purports to produce more energy than it consumes, unless of course you actually have a working prototype that will when tested produce more energy than it consumes. Judge Pauline Newman ... was the Federal Circuit Judge who wrote the opinion in *Newman v. Quigg* and as I read what she wrote I get the sense that she chose her words carefully because she would not want to go down in history as one who wrote that perpetual motion machines are impossible, only years, decades or centuries later to be proven wrong.

The reality is that science fact and science fiction are dictated based on currently accepted understandings, whether they be true or not. As impossible as something sounds, what we understand as science fact is always bounded by our understanding of our surroundings. As our knowledge expands what was formerly science fact frequently becomes science wrong, sometimes badly wrong. Does that mean that someday perpetual motion will be a reality? Who knows. I am not holding my breath or taking any bets, but there are a lot of highly intelligent people constantly trying to unlock the mysteries of the universe and with so many new discoveries it seems science continues to encroach upon the impossible. Just think about cloaking devices and a transporter a la Star Trek, which are already to some extent realities." – Gene Quinn (Patent Attorney), "The Patent Law of Perpetual Motion," October 11, 2011, IP Watchdog.

- ✓ Thus, it would appear that, unless US Patent Publication No 20060073976 A1 violated some scientific law, there could be no impossibility objection. Having an actual working prototype is thus not necessary.
- ✓ Further, as explained in another article by attorney Quinn ("Understanding the Patent Law Utility Requirement," November 7, 2015), "Thus, perpetual motion machines are not patentable because they are not useful because they cannot exist."
- ✓ The utility threshold is otherwise very low and apparently US Patent Publication No 20060073976 A1 also met that burden.

<sup>3</sup> Citation: See Capital Colony and Colony Politics, 2 Order, pp. 532, 538 respectively, and, World Powers Fall, 3 Government Titles, p. 617, *supra*.

<sup>4</sup> Commentary: Obviously, the Archies didn't have any cloaked or T-Ships present, see Ghost Probabilities, 2 Temporal Technology, p. 818, *supra*.

<sup>5</sup> Commentary: The legacy discussion was a difficult section to frame; it went through many revisions. It is an odd recurring theme that I find material related to my writings, expressions of a like mind, after I have written them; I discovered this Point of Wonder video *after* I had already filed for a copyright on GGDM.

<sup>6</sup> Commentary: One of the most extraordinary feats of recollection in modern history occurred in the Elizabeth Smart kidnapping case when her younger sister, Mary Katherine was finally, after three months, able to identify the voice she heard while feigning sleeping in their room during the kidnapping as "Emmanuel," the man who worked for a day at the house six months before the kidnapping. "Emmanuel" was Brian David Mitchell.

<sup>7</sup> Citation: "...OK, let's see... I guess that I'm confused again. Am I here, or am I there? I don't know. Over there, I'm everywhere. I know that. But here is connected to over there. Is that right? But then, where is the real me after all is said and done. Oh! There is no real me. I guess that's it. I only exist inside those people aware of my existence. But what about this me that I can hear talking right here and now? It's me, isn't it?" – Lain, Serial Experiments Lain, Episode 13 (1998).

<sup>8</sup> Commentary: On the day that the country learned that Ariel Castro had committed suicide in his cell (September 4, 2013), there were many angry and confused articles. A lady columnist, whose article I cannot now locate, summarized his legacy succinctly: 'And no one anywhere, anytime, in any way, will miss him for any reason.' *Non*

*homo. Ne hemō.* And yet here we are, in a footnote to a legacies discussion, mentioning Ariel Castro. No one celebrated or mourned his death on the fifth anniversary. He probably didn't give much thought to his legacy. But he is in my memory, the memory of tens of thousands, millions, in the archive of human misery for anyone who looks.

- ✓ However, were Ariel Castro in the late Roman Empire, he might actually be deified, as was Commodus in 195 A.D. See discussion, Terminal Patients, 3 Disruption, p. 289, *supra*. This observation is offered, tongue-in-cheek, of course.

<sup>9</sup> Commentary & Citation: Steve Jackson was allegedly fired from Metagaming for taking too long to design The Fantasy Trip RPG and because the final game was too complicated. In view of my Asperger's-like obsession with and the complexity of GGDM, that is richly amusing. Obviously, I am not applying for any game designer jobs. In 2017, he reclaimed ownership of the title through a provision of copyright law that allows authors to reclaim rights to their works after 35 years.

- ✓ “And the best thing, the very best thing of all, is there's time now... there's all the time I need and all the time I want. Time, time, time. There's time enough at last.” – Henry Bemis, *Twilight Zone*, “Time Enough at Last” (November 20, 1959).

<sup>10</sup> Commentary: For an amusing example regarding names and legacies, look into the historical identity controversy of the 1920s novelist known as B. Traven, whose 1927 novel, The Treasure of the Sierra Madre, was made into a film in 1948 starring Humphrey Bogart.

<sup>11</sup> Commentary: Mary Ann Evans (d. 1880) is buried in a cemetery reserved for social outcasts. It was effectively, the Anglican Church saying, we hold the keys to heaven (I passed a local St. Peter's church recently whose sign in fact prominently displays images of two antique keys as if to suggest...), and if you won't conform to social pressures in your lifetime, we will have the last laugh and decide where you will be buried. It used to work apparently, but now no one is listening. Fortunately, in the time and place where I live, cemeteries are secular and commercial, very few churches are now in the cemetery business and thus, cannot decide where you will be buried or not. Mary Ann Evans, however, I suspect would be pleased by her post-mortem company, as she is buried next to George Henry Lewes (her lover), and near Karl Marx and the evolutionary biologist and political liberal Herbert Spencer (her friend). Birds of a feather are buried together, and chirp for eternity; the last laugh is only momentary.

- ✓ There is a large cemetery up the road from my house which sign proclaims it a “Roman Catholic” cemetery – internment in which I would assume is still controlled by the local Church; upon seeing the sign, I could not help but to think of a scene from Robert Heinlein's Job: A Comedy of Justice (1984) when the main character arrives at the heavenly gates for processing after the Rapture and is asked to which religion he belongs?
- ✓ Graves last as long as anyone cares, as long as the civilization remembers and thinks them important, after that, they must wait for an archeologist in 10,000 years. “[Prof. Tony] Walter says that typically a grave would be visited for about 10 years and after that a spouse has died and children moved away. ‘In Britain, America and in Canada, they came up with this idea of building large out-of-town cemeteries where people will be buried in perpetuity. And that's what's created the problem.’” – Julian Uzielli and Lara O'Brien, “What happens when cemetery space runs out?” CBC Radio, December 12, 2016.
- ✓ “As enemies of the state they are not entitled to a burial. They will be cremated in 7 to 10 days.” – morgue worker, *The Man in the High Castle*, “The Illustrated Woman” (2015).

<sup>12</sup> Commentary: Assuming for the sake of argument that the story that Edmund Ironside, who was King of England for about eight months in 1016, was assassinated in the privy by being impaled from below or assassinated in the privy by being stabbed or shot by a crossbow (there are several versions) – *is a fabrication*, what would be the reason? Edmund had lost most of England in a hard-fought campaign (in which he was wounded in battle) against Cnut the Great of Denmark, though he still retained the crown of Wessex where his family originated. The reason for the story most likely was to *degrade the memory and lineage* of Edmund Ironside, upon whom claims of his two sons or any pretenders might depend. Cnut was determined to eliminate all remaining rivals (including the king-maker traitor who helped his victory) even though a peace had been declared, and adding urgency to this was the agreement that if either Edmund or Cnut died, the other would be king of a reunited England and their sons would be heirs. Edmund Ironside died first, thus implicitly disinheriting his sons from the throne of England, and Cnut shipped his sons off to Scandinavia to be forgotten and where they would be no threat to him.

But, as history takes strange turns and roundabout routes, Edmund Ironside's sons went first to Kiev where they finished growing up in the court of the Grand Princess Ingegerd, daughter of the King of Sweden, then to Hungary where they fought in wars (one died there), and eventually the remaining son, Edward the Exile returned to England and died within a few days in 1057. But his son Edgar, grandson of Edmund Ironside, was king for a few days after Harold Godwinson was killed at the Battle of Hastings (1066). The family dispossessed of the crown again, Edgar

3 Temporal Technology – Surreptitious Entry

fought in a revolt against the Norman king of England, then adventured and fought his way across Europe to Sicily then joined the First Crusade in Palestine (1096, capture of Jerusalem in 1099), while Edward the Exile's daughter, Edmund Ironside's granddaughter, Saint Margaret of Scotland, married Malcom III, King of Scotland, and became the ancestor of many Scottish monarchs, and later all English monarchs to the present day, the line merging with the descendants of William the Conqueror through a tangled dynastic bramble.

- ✓ “On hearing that Edward [the Exile] was alive, Edward the Confessor recalled him to England in 1056 and made him his heir. Edward the Ætheling [the Exile] offered the last chance of an undisputed succession within the Saxon royal house. News of Edward's existence came at a time when the old Anglo-Saxon monarchy, restored after a long period of Danish domination, was heading for catastrophe. The Confessor, personally devout but politically weak and childless, was unable to make an effective stand against the steady advance of the powerful and ambitious sons of Godwin, Earl of Wessex. From across the Channel William, Duke of Normandy also had an eye on the succession. Edward the Exile appeared at just the right time. Approved both by the king and by the Witan, the Council of the Realm, he offered a way out of the impasse, a counter both to the Godwinsons and to William, and one with a legitimacy that could not be readily challenged.” – from Wikipedia article, “Edward the Exile,” captured April 25, 2020.

<sup>13</sup> **Citation & Commentary:** **Missy:** You know the key strategic weakness of the human race? The dead outnumber the living. – Dr. Who, “Dark Water” (2014).

- ✓ Since the population of the world has doubled from 3.5 billion to 7 billion in my lifetime (50 years), that is a really interesting question. A moment of thought about it spins off into definitions, starting dates, and best guesses, but since we have added 3.5 billion people in the last 50 years, the statement becomes much less probable. Of course, for every birth, there is a death... all those living now, will be dead in the blink of a galactic eye in cosmic time. But this could be an interesting ontological measuring stick for a species, obviously it is not supposed to be true of Time Lords from Gallifrey, but at what point does this become true of a species in the universe, and could this be an epochal dividing line as a species swings back and forth over that line? The universe is very old... This could be an interesting in-game measure for species.

<sup>14</sup> **Commentary:** For the record, the gravesite of Attila the Hun is lost, no one knows where he was buried. We know surprisingly little about Attila the Hun, we do not know with any certainty his appearance, ethnicity, or language. Without either a body or certifiable relatives, it would be impossible to trace his genetic/familial descendants (anyone claiming to be a descendent of Attila the Hun is full of sh\*t). This is not uncommon, the physical remains, burial sites, and descendants of most famous ancients, even Biblical figures, are lost. It has been common throughout history for rulers and elites to questionably claim descent from ancient famous people (for mystical reasons), without proof and with the impossibility of ever definitively disproving the claim. Genealogies were sometimes altered to make the appearance of descent from famous ancestors.

<sup>15</sup> **Citation & Commentary:** When I was young, we used to watch the TV show, CHiPs. I remember eagerly turning on the TV or sitting down in the living room to watch CHiPs after a day of school and play. In 2016, I located some CHiPs clips on YouTube, they were short and there were only a few. When I watched them I was appalled at how bad the show was, I couldn't believe we used to watch this and think it was great television! Sometimes the memory of things is better left to nostalgia and not disturbed.

- ✓ Similarly, there were games I played long ago that were fun, but that feel the same way now as watching old CHiPs clips on YouTube, a few years ago, I played the Buck Rogers in the XXVth Century board game, a fun-times game from my youth which I hadn't played in nearly 20 years, and realized how bad it was; likewise, I am not eager to play again the great ancestor of GGDM, the Stellar Conquest board game, which would now be unbearably flat (and not just because of the game board). GGDM fits the gaming itch of those who have put away their youthful games and do not wish to return.

<sup>16</sup> **Commentary:** The 1976 song, “Blinded by the Light” made famous by Manfred Mann's Earth Band is the Jabberwocky of rock n' roll.

<sup>17</sup> **Citation:** “While most of these films make use of science fiction devices, however, travelling in time isn't merely something which happens in the domain of speculative fiction, for in a sense, memory and fantasy are always a form of interior time travel. From such a perspective, films which explore the depths of interior time, such as David Lynch's *Muholland Drive* (2001), or David Cronenberg's *Spider* (1999) can be thought of as films which use psychosis as the method to present time in the form of a shattered crystal, in which it is possible for people to encounter copies of themselves, sometimes exact and sometimes divergent, so many virtual avatars walking around within our heads.” – Christopher Vitale, “Collapsing the Fuzzy Wave: Rian Johnson's ‘Looper’ (2012), Quantum Logics, and the Structures of Time Travel Films,” networkologies (blog), 2012, updated and reposted, October 31, 2014.

## **SHARD: V. Cave Paintings**

\*\*\*

### The Trumpeter Taken Prisoner

A TRUMPETER, bravely leading on the soldiers, was captured by the enemy. He cried out to his captors, “Pray spare me, and do not take my life without cause or without inquiry. I have not slain a single man of your troop. I have no arms, and carry nothing but this one brass trumpet.” “That is the very reason for which you should be put to death,” they said; “for, while you do not fight yourself, your trumpet stirs all the others to battle.”

Translated by George Fyler Townsend. Aesop's Fables (p. 69). Amazon Digital Services, Inc.

**Maybe the Firvulag did it?**  
(conspiracy theories anyone?)

**Excerpts from Eva Botkin-Kowacki, “Mysterious cave edifice suggests Neanderthals were complex cavemen,” Christian Science Monitor, May 25, 2016**

Bruniquel Cave is pitch-black, pools of water cover the floor, and stalactites hang down from the ceiling.

None of these features are surprising to find in an active subterranean cave in southern France. But right in the middle of the cavern floor lies something strange.

Someone has uprooted stalagmites and used them to build something.

Over 1,000 feet from the current entrance to the cave, more than 400 of the oblong rocks are stacked in various structures. Two constructions form short walls as if to enclose a space. The larger one forms a space of more than 220 square feet.

But here’s the catch: The cave has been sealed off and inaccessible to humans for tens of thousands of years.

So who broke off and wrestled about 2.4 tons of rock into neat stacks?

The key lies in when these cave builders worked. A new study published Wednesday in the journal *Nature* finds that these mysterious stacks were built 176,500 years ago, give or take a couple thousand years.

*Homo sapiens* had yet to migrate out of Africa at the time, and the structures are too complex and large for cave-dwelling bears to have built them. Who does that leave?

Neanderthals were the only human species in the region at that time.

“It adds to the ongoing idea that Neanderthal was more modern than generally thought before,” study co-lead author Sophie Verheyden, a geologist at the Royal Belgian Institute of Natural Sciences, tells *The Christian Science Monitor* in an e-mail. “We never thought he would go so far underground, something that is generally attributed to the modern human” much later.

No sunlight streams this deep into the ground. And there weren’t flashlights 176,500 years ago. So Neanderthals that ventured into this cave would have needed some other light source.

Apparently they had already learned how to control fire by this point. Some of the stacked stalagmites have burn marks on them and some of the structures appear to be hearths of some sort.

“It’s the first really good evidence that we have that Neanderthals penetrated very deep into caves and did something extremely unusual,” Michael Bisson, an associate professor of anthropology at McGill University who was not part of the study, tells the *Monitor* in a phone interview. And, he says, “it’s one of the earliest bits of evidence for the structured use of space in the European archeological record.”

This suggests that early Neanderthal society was remarkably complex and cooperative, compared to previous assumptions.

“This kind of structures requires the mobilization of people who choose, who lead, who advise,” and manufacture things, study co-lead author Jacques Jaubert, a professor of prehistory at the

University of Bordeaux, France, tells the Monitor in an e-mail. And they did it all over 1,000 feet from any source of natural light.

“All this indicates a structured society,” Dr. Jaubert says.

How would Neanderthals use these structures?

“We really don’t know at this stage,” Dr. Verheyden says. The scientists don’t think these people were living in the cave. “We tend to think easily of some kind of ritual or cultural structure but I must say that there is no evidence for it up to now.”

**Excerpts from Christopher Joyce, “Mysterious Cave Rings Show Neanderthals Liked To Build,” National Public Radio (NPR), May 26, 2016**

It was in 1990 when a French archaeologist first ventured deep into Bruniquel Cave in southwestern France. Spelunkers had just broken through the entrance, which apparently had been obstructed for millennia. The archaeologist traveled deep into the cave, over 1,000 feet. There he discovered something strange — someone had broken stalagmites from the floor and arranged them in two large ovals. But he died before he could fully explore the site.

Twenty-three years later, in 2013, a crew of scientists managed to get back to the site. Geologist Dominique Genty with France’s National Center for Scientific Research (CNRS) was there.

“It was very strange,” he says, “it was kind of obvious that it was not natural.”

The team found the circles of stone spikes, almost like 2-foot-high fences. But they found more than the original discoverer. There were more stone fragments lying in piles nearby. It was like a huge Lego set, a Neanderthal Lego set, because all of this calcite stone dated back 176,000 years — long before modern humans arrived in Europe.

Writing in the journal *Nature*, the team says it’s the most complex Neanderthal structure ever found. “We know now,” says Genty, “that they were able to make a sort of elaborate construction,” more elaborate than anything Neanderthals had been known to make.

Why did they build it?

There are only clues. For example, the stalagmite pieces all showed signs of being burned. Was it a ritual? Or perhaps it was a sort of fireplace, to warm them or maybe to repel cave bears. Genty says no one knows.

Then there’s the location, more than 1,000 feet from the cave entrance. Archaeologist Marie Soressi with Leiden University in the Netherlands is a Neanderthal expert and says that’s astonishing.

“What is most surprising for me is that this discovery is showing that Neanderthals ventured underground and far away from any source of natural light,” says Soressi. While Neanderthals no doubt took shelter in caves, they were never known to go that deep, so far from light.

The scientists found pieces of burned animal bone at the site, which they think could have been used as torches because the fatty interior of bone burns.

Soressi points out that recent discoveries keep stoking the argument that Neanderthals were in fact not dumb throwbacks compared to modern humans. “I think ... we have by now many different lines of evidence to show that Neanderthals, and even Neanderthals 200,000 years ago, had cognitive abilities not so different from our direct ancestors.”

## Excerpts from “It’s Official: NASA’s Peer-Reviewed EM Drive Paper Has Finally Been Published”

By Fiona McDonald, Science Alert, November 19, 2016

It works.

After months of speculation and leaked documents, NASA’s long-awaited EM Drive paper has *finally* been peer-reviewed and published. And it shows that the ‘impossible’ propulsion system really does appear to work.

The NASA Eagleworks Laboratory team even put forward a hypothesis for how the EM Drive could produce thrust – something that seems impossible according to our current understanding of the laws of physics.

In case you’ve missed the hype, the EM Drive, or Electromagnetic Drive, is a propulsion system first proposed by British inventor Roger Shawyer back in 1999.

Instead of using heavy, inefficient rocket fuel, it bounces microwaves back and forth inside a cone-shaped metal cavity to generate thrust.

\*\*\*

But, there’s a not-small problem with the system. It defies Newton’s third law, which states that everything must have an equal and opposite reaction.

According to the law, for a system to produce thrust, it has to push something out the other way. The EM Drive doesn’t do this.

Yet in test after test it continues to work. Last year, NASA’s Eagleworks Laboratory team got their hands on an EM Drive to try to figure out once and for all what was going on.

\*\*\*

The new peer-reviewed paper is titled “Measurement of Impulsive Thrust from a Closed Radio-Frequency Cavity in Vacuum,” and has been published online as an open access ‘article in advance’ in the American Institute of Aeronautics and Astronautics (AIAA)’s *Journal of Propulsion and Power*. It’ll appear in the December print edition.

It’s very similar to the paper that was leaked online earlier this month and, most notably, shows that the drive does indeed produce 1.2 millinewtons per kilowatt of thrust in a vacuum:

*“Thrust data from forward, reverse, and null suggested that the system was consistently performing at  $1.2 \pm 0.1$  mN/kW, which was very close to the average impulsive performance measured in air. A number of error sources were considered and discussed.”*

To put that into perspective, the super-powerful Hall thruster generates force of 60 millinewtons per kilowatt, an order of magnitude more than the EM Drive.

But the Hall thruster requires propellants, and that extra weight could offset the higher thrust, the team concludes.

Light sails on the other hand, which are currently the most popular form of zero-propellant propulsion, only generate force up to 6.67 micronewtons per kilowatt – two orders of magnitude less than NASA’s EM Drive, says the paper.

But the team makes it clear that they also weren't attempting to optimise performance in these tests – all they were doing was trying to prove whether or not the drive really works. So it's likely that the EM Drive could get a lot more efficient still.

When it comes to *how* the drive actually works without messing up the laws of physics, that's a little less clear.

It's not the focus of this paper, but the team does offer a hypothesis:

*“[The] supporting physics model used to derive a force based on operating conditions in the test article can be categorised as a nonlocal hidden-variable theory, or pilot-wave theory for short.”*

Pilot-wave theory is a slightly controversial interpretation of quantum mechanics.

It's pretty complicated stuff, but basically the currently accepted Copenhagen interpretation of quantum mechanics states that particles do not have defined locations until they are observed.

Pilot-wave theory, on the other hand, suggests that particles do have precise positions at all times, but in order for this to be the case, the world must also be strange in other ways – which is why many physicists have dismissed the idea.

But in recent years, the pilot-wave theory has been increasing in popularity, and the NASA team suggests that it could help explain how the EM Drive produces thrust without appearing to propel anything in the other direction.

“If a medium is capable of supporting acoustic oscillations, this means that the internal constituents were capable of interacting and exchanging momentum,” the team writes.

“If the vacuum is indeed mutable and degradable as was explored, then it might be possible to do/extract work on/from the vacuum, and thereby be possible to push off of the quantum vacuum and preserve the laws of conservation of energy and conservation of momentum.”

\*\*\*

The scientific community is also notoriously unconvinced about the propulsion system – just yesterday a Motherboard article on the EM Drive was deleted by the moderators of the popular subreddit r/Physics because they “consider the EM Drive to be unscientific.”

But is the first peer-reviewed research ever published on the EM Drive, which firmly takes it out of the realm of pseudoscience into a technology that's worth taking skeptically, but seriously. The next step for the EM Drive is for it to be tested in space, which is scheduled to happen in the coming months, with plans to launch the first EM Drive having been made back in September.

If it produces thrust there, the scientific community will need to sit up and take note.

## **Alcubierre Warp Drive**

Excerpt from Wikipedia Article, “Alcubierre drive,” September 23, 2018

The Alcubierre drive or Alcubierre warp drive (or Alcubierre metric, referring to metric tensor) is a speculative idea based on a solution of Einstein's field equations in general relativity as proposed by theoretical physicist Miguel Alcubierre, by which a spacecraft could achieve apparent faster-than-light travel if a configurable energy-density field lower than that of vacuum (that is, negative mass) could be created.

Rather than exceeding the speed of light within a local reference frame, a spacecraft would traverse distances by contracting space in front of it and expanding space behind it, resulting in effective faster-than-light travel. Objects cannot accelerate to the speed of light within normal spacetime; instead, the Alcubierre drive shifts space around an object so that the object would arrive at its destination faster than light would in normal space without breaking any physical laws.

Although the metric proposed by Alcubierre is consistent with the Einstein field equations, it may not be physically meaningful, in which case a drive will not be possible. Even if it is physically meaningful, its possibility would not necessarily mean that a drive can be constructed. The proposed mechanism of the Alcubierre drive implies a negative energy density and therefore requires exotic matter. So if exotic matter with the correct properties cannot exist, then the drive could not be constructed. However, at the close of his original article Alcubierre argued (following an argument developed by physicists analyzing traversable wormholes) that the Casimir vacuum between parallel plates could fulfill the negative-energy requirement for the Alcubierre drive.

Another possible issue is that, although the Alcubierre metric is consistent with Einstein's equations, general relativity does not incorporate quantum mechanics. Some physicists have presented arguments to suggest that a theory of quantum gravity (which would incorporate both theories) would eliminate those solutions in general relativity that allow for backwards time travel (see the chronology protection conjecture) and thus make the Alcubierre drive invalid.<sup>1</sup>

---

<sup>1</sup> Commentary & Citation: A 2020 update: The Wikipedia article on “Interstellar travel” continues to state that the EM Drive (“RF resonate cavity thruster”) did not work when tested by NASA and that any appearance of thrust generated was a non-repeatable anomaly:

- ✓ “A radio frequency (RF) resonant cavity thruster is a device that is claimed to be a spacecraft thruster. In 2016, the Advanced Propulsion Physics Laboratory at NASA reported observing a small apparent thrust from one such test, a result not since replicated. One of the designs is called EMDrive. In December 2002, Satellite Propulsion Research Ltd described a working prototype with an alleged total thrust of about 0.02 newtons powered by an 850 W cavity magnetron. The device could operate for only a few dozen seconds before the magnetron failed, due to overheating. The latest test on the EMDrive concluded that it does not work.” Id., May 15, 2020.

On October 16, 2019, Anton Petrov posted an 11-minute video “NASA Engineer Designs a Near Light Speed Engine But Does It Work?” to his channel discussing the Helical Engine proposed by NASA scientist Dr. David Burns in 2019 (which is also mentioned in the Wikipedia article, *Id.*). While he was critical of the concept, he also noted with disapproval, the vicious and mean-spirited attacks on the idea from the scientific community.

So highly educated scientists continue to propose novel interstellar travel propulsion systems, and get dogpiled by jealous colleagues for daring to step outside the bounds of current science. *Und so weiter.*

*See Appendix PAT1 – Power Activations Tables 1 – Power Activation Costs*

*See Appendix PAT2 – Power Activations Tables 2 – Normal Sequence of Power Activations*

*See Appendix PAT3 – Power Activations Tables 3 – Scenes, Planets & Stars*

*“Think of the Milky Way – or search for pictures of it online – and you’ll see images of a standard spiral galaxy viewed face-on, a sprawling pinwheel of starlight and dust containing hundreds of billions of stars. These images, however, are mostly make-believe.*

*We know the Milky Way is a star-filled spiral galaxy in excess of 100,000 light-years wide, and we know our solar system drifts between two spiral arms at its outskirts, some 27,000 light-years from its center. But much beyond that, our knowledge fades. No space probe or telescope built by humans has ever escaped the Milky Way to turn back and take a portrait; because we are embedded in our galaxy’s disk, we can only see it as a bright band of stars across the sky. For astronomers trying to map it, the effort is a bit like learning the anatomy of a human body from the perspective of a single skin cell somewhere on a forearm. How many spiral arms does the Milky Way have, and how do those spiral arms branch and curl around the galaxy? How many stars does the Milky Way really contain? How much does it weigh? What does our cosmic home actually look like, viewed from another nearby galaxy? Ask an astronomer – and if he or she is being perfectly honest, you will learn that we do not fully know.*

*Among the biggest obstacles to our knowledge is the disk of the galaxy itself, particularly its center, which is thick with starlight-absorbing dust and rife with energetic astrophysical outbursts that can ruin delicate observations. This means we know very little about the other side of the galaxy.”*

– Lee Billings, “Astronomers are finally mapping the Dark Side of the Milky Way,” Scientific American, October 13, 2017

**Colonizing Andromeda Galaxy:** It may deeply alarm you to know that the Milky Way Galaxy will collide with the Andromeda Galaxy ... in a few billion years. On the bright side however, if we wait long enough, it will become much easier to colonize the Andromeda Galaxy.

- ✓ See, Geraint Lewis and Prajwal Kafle, “Andromeda Galaxy brought down to size for head-to-head collision with Milky Way,” repub. in Newsweek, February 15, 2018.

**FTL x 10,000 LY:** Imagine for a moment that Faster-than-Light (FTL) travel was available at speeds up to 10,000 Light Years – that is, the ship would travel the same distance as light does in 10,000 years, in one year. Imagine also a Galactic Empire or other centralized galactic civilization existed – actually spanning the galaxy and not just a handful of local stars – and that the speed of ships was the fastest form of communication available.

The Milky Way Galaxy is approximately 100,000 LY across. Such a situation would mean that it would require 10 years (at best speeds, not counting any necessary stops or detours around the massive black hole in the center of the galaxy) for news, goods, and government actions or directives, to cross the Galactic Empire from one side of the Milky Way to another, going across the center. Any deviation in the route of the ships only adds more light years to the communication.

- ✓ See previous discussion of FTL communications in Communications Breakdown, 1 The Streams of Time, p. 76, *supra*.

By contrast, on Earth, because of the current technology, the communication lag is almost negligible for news and directives transmitted electronically, and only a matter of days for the normal movement of goods and services even for the largest developed nations. The time-zone differences cause more delay – due to the human need for sleep – than any distance consideration. In

the 19<sup>th</sup> Century, the delays could be weeks or even up to three months, but with less population density and lower overall complexity, central governance was possible.

In terms of the universe, 10 years is a millisecond of a millisecond of a nanosecond; but for human lives, and human governance, that's an incredible amount of time to wait for anything.<sup>1</sup> My ship of the imagination has crossed the Milky Way twice, out and back, and is on its way out-bound again, approaching the center of the galaxy, since the day I started this project.

✓ Read it on a t-shirt: “Come over to the Dark Side. We have cookies.”

- Transatlantic Communications: GGDM is now out in the marketplace of ideas. Most ideas end up in the ‘wastebasket of history’ (Montross). For example, one of the proposed solutions to the transatlantic communications problem was to create a line of anchored signal barges, manned by one sailor each, to relay signals by lamp or flags across the Atlantic. I am sure that the person who seriously suggested this was not volunteering for barge duty! The solution was the investor-funded transatlantic telegraph cable in 1858, which reduced England to Canada communication time from 10 days to hours – it worked for 3 weeks then failed, but two new cables were working by September 1866; in the early 20<sup>th</sup> Century, transatlantic telephone by radio was established (by which Churchill spoke to Roosevelt).

Through undersea cables, the entire British Commonwealth was eventually connected around the globe, this network made *the capture of London* (more precisely, Porthcurno Cable Station in Cornwall) desirable to the Germans in WWII – this issue is never discussed in WWII histories as a strategic objective. The HyperPulse Generator arrays in BattleTech serve a similar role and may have been inspired by the transatlantic cable and radio telephone.<sup>2</sup>

- Let's Do Some Calculations: The Milky Way Galaxy – probably just an average galaxy – has *about* 100 billion solar masses, translating to 100 to 400 billion stars (depending on what is the average solar mass per star other than our own).<sup>3</sup> And there are *two trillion galaxies* according to a 3D model recently created from Hubble Telescope observations.<sup>4</sup> Carl Sagan, in Episode 1 of *Cosmos* (filmed 1978-1979, aired 1980), opined, “There are a hundred billion galaxies and a billion trillion stars.” Thus our estimation of the size of the universe has increased by 20 times in about 40 years. We have become 20 times more *insignificant* since the height of the Cold War.

✓ Yes, this is a glass half empty or glass half full of water/air moment. Someone from the Sagan camp will surely say that makes us 20 times more significant and the Earth and humanity more precious not more insignificant. But let's just say that we've gone from a being a pixel on an 8mm film to being a pixel on a 4K screen. Math doesn't lie so they say, the weight of the negative analogies always exceeds the positive and the spiritual.

This issue brings back to the fore a problem called Heinrich Olber's “dark sky paradox,” which asked, based on the number of stars in the sky, even though they are all very distant, considering the age of the universe, why isn't it light at night?<sup>5</sup> A little humility would go a long way in space.

A recent study by UCI and LIGO (observatory) published in August 2017 suggests that there are upwards to 100 *million* black holes in the Milky Way Galaxy.<sup>6</sup> That seems like a lot, it seems like if we turn around, a black hole might be sneaking up behind us! But considering the scale of the Milky Way Galaxy – at least 100 *billion* stars, the black hole problem isn't

really a problem, as there would be just one black hole for every 100 to 400 stars in the Galaxy. But it might make for a very interesting transit system...

The International Space Station (ISS) orbits at **250 miles** above the Earth (low Earth orbit), that's about the distance of a daily commute from Pittsburgh to Philadelphia, except, of course, the problem is that it's straight up (more or less). The equatorial circumference of the Earth is **24,901 miles**. The Moon – good 'ol Luna – is just about **238,900 miles** away, about 9.59 times the equatorial circumference of the Earth – most of the lunatics are much closer, unfortunately. It would take *about* 33 years to walk to the Moon (at a rate of 20 miles per day, 7,300 miles per year, with a few days off to watch the World Series or World Cup), or more accurately, to walk to the spot in space where the moon will be in 32.726 years. Mars is **39 million miles** away at its closest (remember your orbital mechanics); we have a lot of work to do to put a person on Mars. Asteroid Florence, just 3 miles wide, will pass by the Earth at a very close range of 4.4 million miles in September 2017.<sup>7</sup>

---

*“There was a young lady named Bright  
Whose speed was much faster than light  
She set out one day  
In a relative way  
And returned the previous night.”<sup>8</sup>*

---

**Engage!:** Interstellar movement requires a starship, there is no technology which allows movement of *anything* in the 1<sup>st</sup> Era (at the least) without a starship (or System Boat if in-system movement). All interstellar movements that are not initiated by activation of the Expansion Power, Combat Power or Commerce Power, require the activation of the Movement Power.

Specifically:

- 1) Any ship **that is not carrying population** (e.g., not Colony Ships, Troop Transports),
- 2) That is departing from *any* origin system,
- 3) To any destination system that is currently colonized by the ship's owner (other than by ownership of Conquered Colonies, see Supporting Colony, next page, *ut infra*),
  - In this context, “colonized” means having a colony in the system, regardless of colony political status (except Conquered Colonies) or native population type.
- 4) Where the departing ships are either unable to or do not intend to initiate combat upon arrival,
- 5) Requires an activation of the Movement Power.

These conditions precedent must exist *only at the moment of departure*.

A specific set of conditions precedent exists – detailed appropriately in each rules section – for each of the four Power Activations that can initiate interstellar movement. The Movement Power is activated for initiation of movement that does not fit the conditions precedent for initiating interstellar movement under the Expansion, Combat, or Commerce Power, *ut infra*.

- **Ad Astra:** All ship movement occurs in the Galactic Space. Activation of the Movement Power allows as many eligible ships as desired to *depart one starsystem* to **any number** of

*destination starsystems*. One Act and one Scene *on the star of the origin starsystem* is required to activate the Movement Power for all ships in a system that are departing in the same turn. All types of ships may use the Movement Power activation to move, including warships; warships do not automatically require an activation of the Combat Power to move.

- ✓ Despite the fact that ships appear on the Public Space – that is, they are within the consciousness of civilization – they do not move on the Public Space and the Public Space has no effect on their movement (other than the Scene requirement). See also Buzzing Lightyears discussion in 4 The Streams of Time, p. 101, *supra*.
- Flying Dutchman: Because of the uncertain time periods represented by a Regular Turn, it is not prohibited for a ship to perform interstellar ‘short’ movement to more than one destination star in a Regular Turn (or more than one action per turn) by appropriate multiple Power Activations and if Scenes have been previously placed. See Space Hop, 2 Movement, p. 850.
- Engines Offline: Each ship that is ordered to move by activation of the Movement Power must be checked to see if it fails to obey the Power Activation due to inactive Constructural Elements on the ship (see Power Off, 2 Constructural Elements, p. 193, *supra*). A ship that fails to obey the Power Activation does not move, even if other ships at the same location depart due to obeying the Power Activation. If the ship that fails to obey the Power Activation is located at a Supporting Colony system, a **second check** is made using the Supporting Colony’s Constructural Elements and if successful, the delinquent ship obeys the Movement Power Activation and departs as normal. An attempt may be made for each Supporting Colony in the system. This applies only to *failed* Power Activations related to ship movement.<sup>9</sup>
  - ✓ For example, a warship and a Log Ship are ordered to Move from Colony A to Colony B (both owned by their position) by activation of the Movement Power at Colony A. The warship obeys the Power Activation but the Log Ship does not (*sound of FTL engines cycling down*). No Enlightenment was dedicated for the Power Activation. A second check is made using Colony A’s current Constructural Elements (Colony A has only one inactive Constructural Element so only a 15% chance of failure) and the colony passed, so the Log Ship departs as it should have (e.g., the captain was arrested by the *chekist* First Officer on the bridge and handed over to the colony for ‘reeducation,’ order was restored by ship security, there were a few casualties).

---

*“A ship in the harbor is safe, but that’s not what ships are built for” – Old maritime saying*

---

**UniSIM:** Although many units will begin movements by the activation of other Powers, all ship movement follows the Standard Interstellar Movement (SIM) rules and the movement formula and current Ship Speed of the Stardrive Patent they are using. Movement by activation of the Expansion Power or the Combat Power are merely representative of extra preparation and intent in beginning of movement to expand or to go into a potential combat situation, otherwise, movement follows standard rules from the time they depart the origin until they reach the destination. The Movement Power is only activated when ships are departing from a supporting colony system to a destination where there is also a supporting colony.

- Supporting Colony: The term “supporting colony” refers to any Friendly, Converted, or Naturalized Colony, including Low Population Colonies (see 4 Taxation & Census, p. 326, *supra*) which is owned by the owner of the ships in question (at the time of departure), that will

*automatically resupply* the fleets on arrival (see Free Resupply, 3 Construction, p. 678, *supra*, and Operational Supply Limitation, 3 Movement, p. 856 *infra*). A Conquered Colony is not a supporting colony until it is Converted (see Conquered Colony, 2 Order, p. 539, *supra*).

- ✓ A Besieged Colony (see 3 The Sidereal Stage, p. 124, *supra*) or colony currently involved in Colony Combat at the time that the Regular Turn is processed cannot act as a supporting colony. This could be catastrophic as discussed in The Cold Equations, 3 Movement, p. 864, *infra*; ships arriving at the colony may be forced to run the blockade (see Blockade Running, 4 Commerce, p. 1233, *infra*).
  - ✓ As noted in 3 Construction, p. 678, *supra*, the ‘free resupply’ at Supporting Colonies does not require a Power Activation, and thus cannot be affected by Constructural Elements status on either the colony or ship.
  - ✓ As noted in Dark Tea, 2 Temporal Technology, p. 821, Surreptitious Entry, 3 Temporal Technology, p. 828, *supra*, T-Ships (Temporal Ships) do not automatically resupply at a friendly colony unless they reveal their presence. T-Ships must always attempt surreptitious entry when arriving at the destination system.
  - ✓ Supporting Colonies also often provide a second/back up check when starships initiating interstellar movement fail to obey the Power Activation, as described above and in Canned Food, 3 Expansion, pp. 913-914, Move Out!, 1 Combat, p. 942, Before You Go, 1 Commerce, p. 1189, and Blockade Running, 4 Commerce, p. 1233, *infra*.
- History Again: Supporting colonies are historically analogous to the 19<sup>th</sup> Century naval need for coaling stations, and before that, in the Age of Sail, the need for ports to obtain fresh water and food, and repairs. There is a reason why sailors were notorious for alcohol consumption and for ‘spending like a sailor’! Thus, the need for ports drove colonial expansion, trading strategies, diplomacy, and shipbuilding, over the course of several centuries. One of the factors behind the Commodore Perry Expedition to Japan, 1852-1854, was the U.S. concern that the European powers had already monopolized the coaling locations across the Pacific, giving them an advantage in war and trade. *The opening of Japan to the West never was about Japan’s wellbeing from the view of the Western colonial powers*; no one asked how this would affect Japan’s economy, culture, or political environment. And Japan got a cholera epidemic from it as well. Conversely, the European powers were very concerned that the U.S. would obtain exclusive trading rights in Japan and soon forced themselves upon Japan’s tottering government as well, extracting treaties and concessions.
- Interstellar Chess: Strategy is in large part, but not exclusively, about position, Chess is a game of position, business people talk about market positioning of their products and services, baseball managers use ‘defensive shifting.’ I backed the board game Blueshift on Kickstarter, and in May 2019, finally was able to play two games at the game club.<sup>10</sup>
- ✓ The first game was a terrible experience where I was completely out of position at the end of the game, unable to do anything at all. I ended the game turtling in the corner just to make sure the two big players had to fight each other to win instead of one of them winning by knocking me out.
  - ✓ The second game, I was able to place units and time my attack toward the center of the board late in the game, first defeating a player who was in the space I attacked, and then I turned and attacked from the space I had won into a space owned by a second player who was poised to win the game on his next turn. It was small consolation

to the player I had to victimize initially (and who had no chance of winning), but had I not been in that position (space), I would not have been able to take a shot at stopping the guy who was about to win the game. I did win the second battle as well, but the other players on their turns were unable or unwilling to do anything effective and I finished in close second, first loser, position in the second game. Of course, my war wasn't their war, my success would have only prolonged the game which they had no chance to win and little to gain, so it was my battle and up to me to succeed or fail.

For whatever a position needs or thinks they want to do in GGDM, the position's ships will need to be in the right place (spatially), at the right time, with sufficient support, whether it is technology, material enhancements or logistics. Ship, asset, and colony placement for the future should always be a consideration in Power Activations throughout the entire game; it is a sad game of catch-up if Power Activations are being used to scramble in reaction to a sudden emergency.

- ✓ **John Connor:** We're playing that most American of games. **Web Smith:** Which is what? **John Connor:** Catch up. – Rising Sun (1993).

---

*“Any belief that puts itself beyond doubt nurtures its own collapse.”*

– Stephen R. Donaldson, [Reave the Just and Other Tales](#) (2000)

---

**Gap Info:** And then there is that ‘leap of faith,’ a most curious human term. Consider this usage note from Merriam-Webster online dictionary at *faith*: “Belief, faith, credence, credit mean assent to the truth of something offered for acceptance. Belief may or may not imply certitude in the believer. Faith almost always implies certitude even where there is no evidence or proof. Credence suggests intellectual assent without implying anything about grounds for assent. Credit may imply assent on grounds other than direct proof.”

- ✓ I was talking with a Traveller RPG aficionado at the game club in July 2019. I was discussing the Sandcaster Turret defense system on ships; it is one of those sci-fi ideas that seems good at first glance but is less and less practical the more you think it through. The conversant pointed out that it remains in the current game (40 years later) because it is the only defense system for ships against laser turret weapons in Traveller, then surprised me somewhat by adding that we just have to have faith in the game system and accept that it is something that works!

I have argued throughout GGDM (e.g., see Assumptions of Light, 1 Stardrive, p. 781, *supra*) about having to accept certain future technologies (and conditions) as *necessary premises* or assumptions of the game setting (e.g., faster-than-light travel, drive to colonization, Government Titles) and that they must be accepted hypothetically on the basis that we cannot possibly predict the long-term course of future technology, its capabilities, and social effects because they are non-linear (see Uber Alles, 2 Eras, pp. 767-768, *supra*), that is, *emergent* (a view also held by Vernor Vinge, who invented the ‘technological singularity’ term, see feature quote, 2 Technology, p. 705, *supra*). *Necessary premise* is a major resident of science-fiction stories, which it probably inherited from fantasy – any story involving gods, evil, and magic must have them as a necessary premise or the story is nonsense – which fantasy probably learned from religion – all religions (and love) are castles in the sky *built on the clouds of a necessary premise*.

However, ‘faith’ is never a word that entered my thoughts in accepting the seemingly implausible future technologies of GGDM or of any other space-opera game or interstellar setting; what I have described is not the normal use of faith, it is necessary premise or background assumption, more similar to how Merriam Webster described ‘credence’ or ‘credit’ (*ut supra*). Perhaps that is a window to my current concept of faith? Perhaps my concept of faith is a bit narrower, a bit scrambled vis-à-vis others? Or perhaps what he meant was that we must accept Sandcaster defense as a necessary premise in a game that features starship combat with lasers? Ok, but I have never seen Sandcaster defense anywhere but Traveller (because it is operationally problematic), but I have seen lots of laser starship battles in movies, sometimes with convenient (and very questionable) ‘force fields’ for defense and sometimes with no apparent defense except ship hull armor, speed, and maneuver.

- ✓ “Force fields or screens? Well, again, they climb in the face of the electromagnetic theory. You can’t make the expanding wavefronts of a wavefront stop expanding. No.” – James Blish, *The Tale that Wags the God* (1987), Kindle Locations 598-599.<sup>11</sup>

But then a few days later, I read an article from the MIT Technology Review wherein the author made the following Asimovian statement:

- ✓ “This raises mind-boggling questions. As the technology advances, we might soon cross some threshold beyond which using AI requires a leap of faith. Sure, we humans can’t always truly explain our thought processes either – but we find ways to intuitively trust and gauge people. Will that also be possible with machines that think and make decisions differently from the way a human would?” – Will Knight, “The Dark Secret at the Heart of AI,” MIT Technology Review, April 11, 2017.

Now, this is a different meaning of faith, closer to what is meant by religion, as is indicated by the next sentence. Can we make the ‘leap of faith’ into something built by us – in whom we have little faith, despite our ability to “intuitively trust and gauge people” – into ‘Deep Learning’ AI that is opaque to us, and that may be better or smarter than we are? That is the technological singularity problem. Will it see the existential void as we do, or laugh at us as pets, children?<sup>12</sup>

---

*“Astronomers have discovered the oldest supermassive black hole ever found – a behemoth that grew to 800 million times the mass of the sun when the universe was just 5 percent of its current age, a new study finds. This newfound giant black hole, which formed just 690 million years after the Big Bang, could one day help shed light on a number of cosmic mysteries, such as how black holes could have reached gargantuan sizes quickly after the Big Bang and how the universe got cleared of the murky fog that once filled the entire cosmos, the researchers said in the new study. Supermassive black holes with masses millions to billions of times that of the sun are thought to lurk at the hearts of most, if not all, galaxies. Previous research suggested these giants release extraordinarily large amounts of light when they rip apart stars and devour matter, and likely are the driving force behind quasars, which are among the brightest objects in the universe.”*

– Charles Q. Choi, “Oldest Monster Black Hole Ever Found Is 800 Million Times More Massive Than the Sun,” Space.com, December 6, 2017

<sup>4</sup> Citation: Andrew Griffin, “Universe is far bigger and more stuffed with galaxies than previously thought, scientists reveal,” Independent UK, October 14, 2016.

<sup>5</sup> Citation & Commentary: Ian Johnson, “Astronomers prove 200-year-old theory about why it gets dark at night,” Independent UK, October 14, 2016. Remember that a paradox is “a statement that is seemingly contradictory or opposed to common sense and yet is perhaps true” (from Merriam-Webster online dictionary).

- ✓ A curious side case is a sub-giant metal-poor star labeled HD 140283 located 190 LY from Earth, which has consistently been dated as being older than the universe. How can that be? Should theists celebrate? The problem with the problem is that dating both has been a moving target, both the age of the star and the age of the universe have been shifted a few hundred million years this way and that during the time we have tried to figure out the star’s age. It is certain that we have got something wrong in our methods, but that doesn’t automatically mean that the star is not older than the universe....

<sup>6</sup> Citation: University of California, Irvine, “UCI Census indicates that black holes pervade the universe,” published in phys.org, August 8, 2017.

<sup>7</sup> Citation: Ryan F. Mandelbaum, “Closest approach ever by a large asteroid won’t end life on Earth, but probably should,” Gizmodo, August 18, 2017.

<sup>8</sup> Citation: Anonymous limerick of unknown interstellar origin. Probably written by a bored physics undergrad on Sol Three.

- ✓ The limerick appears on the bottom of Page 31 of the May 24, 1963 issue of Life Magazine (of which I have a collector’s copy) where it is challenged as being untrue (Albert Rosenfeld, “A 3,000,000-year Trip in Only 55 Years,” pp. 28-34). This provides a historical date of usage.

<sup>9</sup> Commentary: The Royal Navy mutinies of 1797 at Spithead and The Nore are the *essence* of inactive Constructural Elements causing Power Activation failure on ships. And the *example* of a Supporting Colony second check. Compare this to the results of the famous Mutiny on the Bounty (1789) or the Batavia Mutiny (1629) far from port.

<sup>10</sup> Commentary: The boardgame Blue Shift (2017) is an interesting and well-play-tested game. Unfortunately, the rules could have been better written and edited. The young man who wrote the game rules has not learned to edit; editing requires stepping outside of yourself: It doesn’t matter what is in your head, it is what is on the page that counts in game rules or legislation (readers of GGDM might think I took that rather to an extreme). He obviously knew things about the game that he failed to make clear in the rules (in addition to the obvious typos, and other editing issues), but eventually, we figured it out.

<sup>11</sup> Commentary: The implication of force fields and screens, as James Blish expressed it, is some kind of time stop technology or temporal stasis at work – that is the only way to make expanding wavefronts stop expanding in space – short of striking something else – is a temporal effect.

- ✓ As has been noted previously (see Assumptions of Light, 1 Stardrive, p. 781, and Thumbing Our Nose at Einstein, 1 Temporal Technology, p. 802, *supra*), in order to have FTL without time-dilation effect, one must assume that they have developed some primitive level of temporal technology.

*“For one thing, there was a convention among the authors of those days that since the solar system lies approximately in a flat plane (the plane of the ecliptic), the only way you could get from one planet to another was by traveling along that plane. This meant that if you were attempting to go any distance beyond the orbit of Mars, you were involved in an awful lot of banging and clashing about among the asteroids. My favorite example of this comes from a somewhat later period – a story by Sam Moskowitz in which the hero, in order to reach Saturn, finds himself necessarily banging and clashing his way through the planet’s rings.*

*Now, if there is a more avoidable astronomical object in the solar system than the rings of Saturn, I do not know what it is! But there was this flat plane convention; and we were stuck with it. It took me a long time to learn from science fiction that space happens to be three-dimensional, and that in order to avoid the asteroid belt all you need is a slight expenditure of fuel and you can go over it!”*

– James Blish, *The Tale that Wags the God* (1987) (Kindle Loc. 492-500)

**Interplanetary Movement:** Interplanetary Movement occurs when the origin and destination stars are the same, that is, between planets orbiting the same star, and does not require the activation of any Powers, thus it *occurs before any Action that requires the activation of a Power*. See Clockwork Universe, 3 The Streams of Time, p. 90, *supra*, regarding normal order of Regular Turn actions processing. It is assumed that all positions have accomplished efficient interplanetary travel before the start of the game. Movement of ships, boats, and fighters between system space and planets in the same system is *instantaneous*, and will be executed secretly unless another position’s colony or ships are present. Interplanetary Movement may not occur between planets owned by the same position if any of the colonies in the system owned by that position are besieged (see Blockade Running, 4 Commerce, p. 1233, *infra*).

- ✓ Thus Homeworld and Lost Colonist positions may automatically colonize all available planets in their systems before the game begins.

Activation of the Expansion Power for the purpose of Transporting Populations (see Colonization, 1 Expansion, p. 876, *infra*) is only necessary for *interstellar movement* of colony ships (i.e. to another starsystem). Loading and Unloading or Landing colonist after *interplanetary movement* will still require Expansion Power activations regardless of distance moved.

- **Gray Space:** There is some possible gray area here; the Interplanetary Movement rule was written assuming the usual (in our provincial view) single star with a host of planets, rocks, Tesla Roadsters and comets orbiting. If binary systems are specifically introduced into the game, especially those that have separate planetary systems, it may require a ruling as to whether the stars are within interplanetary movement distance.
  - ✓ For example, Alpha Centauri A and B are binary stars that orbit around a common center point every 79 years; the distance between the two stars is interplanetary (that is, within the distances between the Sun, Saturn, and Pluto). Alpha Centauri C (also called *Proxima Centauri*) is a red dwarf, orbiting Alpha Centauri AB at .21 LY distance. Interplanetary movement range in GGDM or FTL?

Would movement from a planet in Alpha Centauri AB to Alpha Centauri C be interplanetary movement (possibly with a one turn delay) or would it require stardrive? (Information was gathered from Wikipedia articles, “Alpha Centauri” and “Binary Star,” June 10, 2018.) This is important not only for Power Activations but for system boats. GGDM is over-simplistic, its star and world generation rules are set at the lowest common denominator of space-opera sci-fi writing and fandom, systems such as Alpha Centauri (our closest neighbor) show levels of detail that can be added to the game terrain of Galactic Space if desired.

- **Ships in Port:** Normally, it is not important which planet ships in a system are located at; it is assumed that ships which are on a star occupy all of the system’s space as their ‘zone of control.’ Thus ships in a starsystem are never assigned a planet at which they are located, unless they have specifically moved there or taken shelter at the planet (e.g., retreats from Ship Combat, see *The Better Part of Valor*, 3 Combat, p. 981, *infra*, and *Blockade Running*, 4 Commerce, p. 1233, *infra*) but are instead placed on the system’s star in the Public Space for as long as they remain in the system.
  - ✓ Zone of Control (ZOC) is a 1960s wargaming term that means the unit’s ability to project military power and movement control into adjacent spaces on a flat hex map to hinder the enemy’s ability to use that space. In GGDM, it is congruent with the assumed ability to be anywhere in system space effectively ‘instantaneously’ within the time frame of a GGDM turn; that is, it may take days, weeks or months in real time.

Conversely, in the DUST sci-fi short, “FTL” on YouTube (written & directed by Adam Stern, 2017), the experimental FTL ship moved from Earth to Mars in about 3 minutes, and somehow was able to just stop instantly (*à la* Star Trek warp drive) without ill effect on the pilot, e.g., being thrown through the cockpit glass at FTL speeds. Not to mention being squashed into subatomic particles by the initial FTL acceleration. And there was no time dilation either. But this technology may also be assumed in GGDM.

---

**Einstein:** *There is no coordinate system that is principally preferred by its simplicity; thus there is no method to distinguish between ‘real’ and ‘non-real’ gravitational fields.*

**Palagyi:** *The discussion between Einstein and Lenard has made a deep impression upon me. One encounters here again the old historic opposition between experimental and mathematical physics, as it already existed between, for example, Faraday and Maxwell. Mr. Einstein says that there is no preferred coordinate system. But there is one. Let me think biologically, then any man carries his coordinate system within himself. In the course of this thought, a refutation of the theory of relativity is contained.*

**Mie:** *I never understood, that the view in which the aether was essentially the same as seizable matter, should have been only discovered by the theory of relativity. This was already done long before by Lorentz in his book ‘electrical and optical phenomena in moving bodies.’ Also Abraham in his textbook, in the time when he was still in opposition to the theory of relativity, said: ‘The aether is empty space.’ I’m of the opinion, that even by approving Einstein’s gravitational theory, one has to distinguish between mere fictitious gravitational fields, that one introduces into the world by the choice of coordinate system, and the real gravitational fields that are given by objective facts. I have*

*recently shown a way, how one arrives at a ‘preferred’ coordinate system, in which all fields that are only fictitious are excluded from the outset.*

**Einstein:** *I cannot see, why such a preferred coordinate system should exist. At most one could think to prefer such coordinate systems, in relation to which the Minkowskian expression for  $ds^2$  is approximately true. But neglecting the fact, that such systems do not exist for extended spaces, such coordinate system are surely not exact, but can only be defined approximately.*

– from *Allgemeine Diskussion über die Relativitätstheorie (1920)*, *Physikalische Zeitschrift*, 21, pp. 666-668, English translation on Wikisource at “The Bad Nauheim Debate”

**Cubed Space:** The concepts for understanding the position of the stars, calculating movement distance and time, and understanding the Starlog are singular for the game. All positions use the same system of Galactic Space coordinates.

That is, while the Public Space is subjective, Galactic Space is objective, necessarily universal. *Sort of* like the debate above between fictitious and objective gravitational fields in relation to coordinate systems.

➤ **Positional Value:** The initial playing area is a cubic section of Galactic Space and the Positional Value of each star, found on the Starlog next to the star’s name, is that star’s physical location within the playing area. In order to simulate the three-dimensional aspects of the playing area, each star’s Positional Value is expressed as a set of numbers labeled X, Y, and Z. Positional Values are used to calculate the movement distance between stars. The method of calculating distance between the origin and destination stars is expressed in the Movement Formula section of the Stardrive Patent whose stardrive system the starship is using.

✓ See How it Moves and Blurry Hurry!, 2 Stardrive, both p. 794, *supra*, regarding movement formula requirement of Stardrive Patents.

➤ **Real Space:** Positional Value is the location of the star system in ‘real space’ aka the Galactic Space in GGDM. The arrangement and relationship of the planets and stars in the Public Space bears no relation at all to the actual positions of the stars and planets in the Galactic Space and are not used in calculation of movement distances. Ships may move, using non-Movement Power Activations, to stars that are not currently in the Public Space; *ships cannot move to star locations that are not in Galactic Space (i.e. not on the current Starlog).*

Because of the conditions precedent to initiate interstellar movement via the Movement Power Activation, ships *may not move to stars using a Movement Power Activation that are not also currently on the Public Space of the position.* While it might be tempting to read meaning into this, it is generally just a consequence of the game mechanics, and does not create any correspondence relationship between the Public Space and Galactic Space.

➤ **Disturbulence:** There may be space-time Disturbulence around each star; this Disturbulence is expressed as a Disturbulence Modifier which forms a kind of terrain in Galactic Space. The Disturbulence Modifier of each star is particular to each Stardrive Patent and is unknown until a ship with that type of stardrive enters the starsystem for the first time (making Scouts very expendable—err, valuable).

Turbulence occurs in the atmosphere of a planet, or on a body of liquid, Disturbulence occurs in space-time. Because space is so...‘thin’ only ships travelling at FTL speed encounter ‘Disturbulence’ when approaching a star’s gravity well. Possibly, FTL travel wounds or damages the universe, FTL drives put forth a tremendous amount of power bending space. True sub-light drives probably don’t encounter disturbance. Anyway, that’s the game mechanical excuse for this rule...

- ✓ Homeworld systems will never have a Disturbance modifier for the very first Stardrive Patent obtained by that position as it is assumed that the scientists would have developed and tuned their first stardrive based on the properties of the system space around them. Homeworlds are only special to their starting position and may have Disturbance Modifiers for other position’s Stardrives.

The Concierge determines the Disturbance Modifier for each star at the moment that a ship of that stardrive type attempts to enter the star for the first time. The Disturbance Modifier for each star will be expressed in either *extra turns of movement required to enter the star*, or *extra movement distance*, or both. In short, Disturbance modifiers cause ships to not arrive when expected, at least for the first ships going to that system, but can be accounted for later.

- ✓ **Temporal Disturbance** (extra turns) is very difficult to overcome, however spatial Disturbance (extra movement) may be overcome by increasing Ship Speed through continuing research (see Dog Star and Spindizzy, 2 Stardrive, both p. 792, *supra*).
- ✓ Temporal Disturbance Modifiers are usually assumed to add extra turns, but it’s not impossible that they may rarely make movement to a starsystem faster by subtracting a turn from the flight; that is, the star system seems to reach out and pull the ship through a ‘barrier,’ (mythopoeicly speaking?) skipping it ahead in time.

Disturbance Modifiers are one of the major tools to shape the Operational Characteristics of the Stardrive Patent (see 2 Stardrive, p. 795, *supra*); it is suggested that the Stardrive Patent establish standard die roll ranges for the Disturbance Modifiers.

- ✓ For example, some stellar classes (see Stellar Classes, 2 Expansion, p. 898, *infra*) might be more difficult to approach than others with a particular Stardrive (for reasons unknown, unknowable based on our current understanding, but probably related somehow to the color dots in the Merchant of Venus (1988) board game)?

Again, it bears repeating that balance does not mean no advantage gained, but rather that the advantage gained from the effort of making a new Stardrive Patent should be commensurate with the effort required and should not wreck the game by being overpowered; lastly, the stage of the game should be considered.

- **Starlogs:** Each position will have its own running Starlog. All position Starlogs will contain the same coordinates, star colors and other basic *universal information* as well as links to the display for each star. Upon determining the Disturbance modifier for each starsystem, the Concierge will record it permanently on the position’s Starlog. Once recorded, the Disturbance modifier for each star for each stardrive, probably won’t change. You cannot change space or time, you can only change your stardrive, by either improving it, or abandoning it. Subsequent movement to the star will take into account the known Disturbance Modifiers.

*“Spacetime tells matter how to move; matter tells spacetime how to curve.”*  
 – John Archibald Wheeler, Geons, Black Holes, and Quantum Foam (1998),  
 p. 235

**Standard Interstellar Movement (SIM):** Apparently the universe is a twisted place.

Humans, tiny minds living on our tiny primal planet, have no real concept of how big space is (we don't *grok* it); we just don't have a common *non-scientific language* which conveys the emotional, cognitive distances of space, not only between the stars, but even within our own system space. The truth is that distance really doesn't matter in space (and is not determined with any degree of precision in this game); all that matters is speed and time and how to live long enough to arrive at the destination. Time is more important than distance in interstellar space (and our lives) and humans don't live long enough to truly appreciate it.

➤ **Groundhogs:** Most of our interstellar science-fiction settings continue to reflect our provincial 'groundhog'-view of interstellar space. This is necessary, perhaps, for the audience and to keep the story humanly manageable. It's like explaining to a landlubber the vastness of the Pacific Ocean; you just cannot imagine how vast is the Pacific Ocean until you have been on it onboard ship, flying over it doesn't do it justice, you have to *feel* the vastness; similarly, the Midwest and Great Plains in the United States are called 'fly over country' because that is what most people do, flying from city to city, coast to coast. Dr. Paul Mason of Duquesne University suggested to the class that the current concept of divinity did not develop until Europeans began sailing the deep oceans. FTL transit as usually portrayed, would not allow us to feel the vastness of space (sunlight takes 8 minutes 20 seconds to reach the earth, *five hours to reach Pluto*), rather, it is movement from point to point, star to star:

- ✓ “That would be because of warp speed, which for present purposes consists of looking through an unnecessary window at bright lights zapping past. This method of transportation *prevents any sense of wonder at the immensity of outer space* and is a convenience not only for the starship but also for the screenwriters, who can push a button and zap to the next scene. The concept of using warp speed to escape the clutches of a black hole seems like a recycling of the ancient dilemma of the rock and the hard place. ... Lots of verbal commands seem implausibly slow. Consider, at light warp speeds, how imprecise it would be to say ‘At my command ... 3 ... 2 ... 1 ...’ Between ‘2’ and ‘1,’ you could jump a million galaxies.” – Roger Ebert review of Star Trek 2009, May 6, 2009 (emphasis added).<sup>1</sup>

Consider this casual gripe between friends: “I spent three hours driving in a hot car with three amped-up kids, get to the show and found it was canceled, then had to drive back home.” The typical response is likely a commiserate, “Ugh!” How many times do we casually substitute time for distance?

- ✓ “Time is perhaps our prime yardstick. The distance to a friend's home is generally calculated by how long it takes to get there rather than by the number of actual miles it is, for time is the reality given varying road, traffic and weather conditions, and alternate routes, and distance isn't, not really.... we surround ourselves with realities that depend on one other dominant reality, the inexorable passage of time, a precisely measurable phenomenon.” – Roger Caras, A Cat is Watching (1989), p. 194.

How much of our appreciation of distance and work is expressed emotionally rather than with Lockean precision?

- **Time & Space:** Standard interstellar movement is simply the amount of time, in Regular Turns, that is required for starships leaving the origin star to arrive at the destination star, taking into account Disturbance Modifiers. Disturbance Modifiers are only *applied when entering the star*, not when leaving it, entirely for sake of convenience in play. Time of movement is calculated as the movement distance (calculated as described on the ship's Stardrive Patent) divided by the speed of the ship. Movement of the ship is then tracked solely in terms of the number of turns elapsed between the time it left the origin and until it arrives at the destination; the Concierge does not keep or record the current X, Y, and Z coordinates of any ship in interstellar space as they are irrelevant to the game (unless it is important to a story event).
- **The FTL Missile:** A starship leaving on an interstellar voyage becomes, in effect, a missile traveling between stars at, presumably, faster than light speed. Thus, it is always assumed that starships depart at the maximum Ship Speed allowed by the current Stardrive Patent for that ship's Stardrive type, and that they travel in a straight, uninterrupted line toward the destination at a constant speed (constant speed is assumed for game convenience).
  - ✓ Starships in interstellar flight will not obey new Power Activations until they arrive and do not require additional Power Activations to continue moving each turn.
  - ✓ Starships *en-route* to a destination star may not change destinations or ship speed, stop, alter course, or interact with or engage other starships in FTL combat in interstellar space. A ship also *cannot avoid* entering/arriving at the destination starsystem.
  - ✓ Improvements in ship speed will not affect the travel time of a ship which is *en route* to a destination star at the time of the improvement.
  - ✓ It is possible to design Stardrives which do not travel at a constant speed (for example, starts slow, gains speed), and this will be allowed by the Concierge only if it is fitting, useful, and/or interesting for the particular game or helps to balance the operational characteristics of the Stardrive Patent. It is also possible to design Stardrives which allow ships to depart at less than maximum Ship Speed (but why?).
  - ✓ Since the coordinates of ships are not recorded when they are between stars, there will be a *very strong presumption of un-playability* against any attempt by positions to create technologies or Stardrives that allow ships to change destinations or ship speed, stop, alter course, or interact with or engage other starships in FTL (or hyper-space or whatever) combat.

It is not impossible to imagine an FTL movement system that requires complete stops in deep interstellar space. For example, the Jump Circuit in Norman Spinrad's *The Void Captain's Tale* (1982) implies that the ship is stopped in interstellar space for a time after each jump:

- ✓ “At the other side of quite literally immeasurable temporal discontinuity, the ship ‘comes out’ of the Jump an average of 3.8 light years away and most often roughly along the desired vector.” (see full feature quote 2 Stardrive, p. 797 *supra*).

Thus a Spinrad trip may involve a sequence of jumps, separated by days of non-movement, the time it takes the Pilot to sufficiently recover from the near-death trauma and be medically

cleared for the next jump. At the end of the story, on the ninth jump, the Pilot died (well, that is not entirely accurate) due to an act of omission by the Captain, leaving the ship stranded Pilotless between stars. The Void Captain's Tale (1982) is the Captain's recorded confession of criminal negligence and fall from social grace.

- Departure: Every ship which begins interstellar movement must have a destination star assigned and travel time calculated before it leaves the origin. From the coordinates of the origin and destination stars, the movement distance is calculated (including Disturbulence Modifiers) and when the movement distance is divided by the departure speed, the travel time, in Regular Turns, is determined (fractions are rounded up).
  - ✓ Ships may not plot destination stars that are beyond the range of the ship's current Operational Flight Limitation (OFL) (see 3 Movement, p. 855, *infra*); Scouts have extended OFL. See Imperial Interstellar Scout Service, 3 Movement, p. 855, *infra*.
  - ✓ When a starship departs the origin system, it is removed from the Public Space (that is removed from the origin star, it is 'removed from the universe') and the destination and travel time are calculated and recorded.
  - ✓ A Power Activation is only required for the departure of the ship – like sending off a paper airplane – additional Power Activations are not required for the continuous progress of the ship toward the destination star.
  - ✓ The ship's progress toward the destination will be updated each time Actions for the position are processed, or, if no Actions are submitted, the ship's progress will be updated at the end of the position's time period for submitting Actions. Ships *en route* to a destination star will not stop traveling because the owning position did not submit Actions! Arrival cannot be avoided by not submitting Regular Turn Actions.
- Space Hop: Short Movement, a 'space hop,' occurs when a starship is able to move between two stars in one Regular Turn. Short Movement is accomplished in less than one Regular Turn if the current Ship Speed is equal to or greater than the movement distance between the origin and destination stars, including any applicable Disturbulence Modifiers (*ut supra*).
  - ✓ Short Movement must overpower all Disturbulence Modifiers in order to be considered short movement. Temporal Disturbulence Modifiers will usually wreck short movement (*ut supra*, p. 847) and sometimes, may make it possible when not possible.

When a Short Movement is accomplished, the ships arrive at the destination **at the end** of the same Regular Turn that they departed the origin and are available for Power Activations and supply functions at the destination at the beginning of the next Regular Turn.

The turn of departure counts as one turn of movement before the beginning of the next turn. This should be true of all interstellar movements. This is a concession to playability, to make the game move along, and a necessary acknowledgement of uncertainty of how much time is represented by a Regular Turn.

- ✓ "Get in the fast lane, grandma! The bingo game is ready to roll!" – Mike Lange, Pittsburgh Penguins legendary broadcaster (one of his famous Langisms).
- Heroic Movement: GGDM does not prohibit a ship from moving more than once in a Regular Turn, due to the variable and unknown time periods represented by a turn. This implies that it is possible to plot movement of ships from origin stars at which they are not currently

located; thus, a position could accomplish *heroic* movement by stringing together a number of Short Movements in one Regular Turn through a ‘fast lane’ of close stars that have Scenes, using multiple Power Activations for the same ship(s). However, the cost is that fast movement may consume most or all of the actions in a turn and a lot of Scenes.

‘Leftover movement’ upon arrival at each destination star via Short Movement is lost because the ship must pass through the starsystem. Thus, it cannot be added to any continued movement beyond the initial destination star. A movement is complete upon arrival at the destination star, farther movement requires another Power Activation.

- ✓ **CASE:** Endurance rotation is 67, 68 RPM. **Cooper:** CASE, get ready to match our spin with the retro thrusters. **CASE:** It’s not possible. **Cooper:** No. It’s necessary. – Interstellar (2014).
  - This is the point in the movie when Cooper transcended. You never see how they matched the rotation. It was impossible. The computer was not wrong, empirically speaking. Yet they did. It was necessary.<sup>2</sup>
- **Long Jump:** Long Movement, the ‘long jump,’ occurs when the moving starship is not able to complete the movement distance in one Regular Turn. No one can physically bar a ship from entering any starsystem, even if it is currently colonized or occupied. Starships engaged in Long Movement arrive *before* the first Power Activation on the Regular Turn of their arrival. Compare this to Short Movement in which ships arrive at the end of the Regular Turn in which they departed. Ships arriving via Long Movement are not in the same system as other ships and colonies at the *beginning* of the Regular Turn for whatever function that might require that as a condition precedent.

---

*“Many men – risking indictment as warlocks or sorcerers – had tried to probe the secrets of the Great Destroyer and compute the speed of these mighty spacecraft of antiquity. Some had even claimed a speed of 100,000 miles per hour for them. But since the starships made the voyage from Earth to the agricultural worlds of Proxima Centauri in slightly less than twenty-eight hours, such calculations would place the nearest starsystem an astounding two million eight hundred thousand miles from Earth – a figure that was as absurd to all Navigators as it was inconceivable to laymen”*

– Alfred Coppel, “The Rebel of Valkyr” (1950)

---

**Mushrooms from Alpha Centauri:** They must be farming mushrooms as Proxima Centauri is a dim red dwarf star. Proxima Centauri is 4.243 light years from Earth, that is, light from Proxima Centauri requires over 4 years to reach Earth (and over two months to reach Alpha Centauri AB, which is .21 LY away).

- ✓ Light from the sun requires five hours to reach Pluto.
- ✓ At 56,000 km/h, Deep Space 1 probe would take over 81,000 years to reach Proxima Centauri.
- ✓ At 28 hours to reach Proxima Centauri from Earth, the “mighty spacecraft of antiquity” are travelling at 1,327.45 times the speed of light.

This is somewhere around Star Trek Warp 9, according to one table (where Warp 1 = c) in the Memory Alpha article, “Warp Factor” (however, the article clearly demonstrates that the writers have been very inconsistent on Warp speeds, probably from too many ‘shrooms on their pizza).

In the Star Trek TNG Season 1 Episode “Where No One Has Gone Before,” the Enterprise is thrown 2.7 million light years from our galaxy (allegedly they passed the M33 Galaxy) and Picard states that at maximum warp, the Enterprise would return to Earth in 300 years (there is an amusingly similar scene in Stargate SG-1 season 4 cliffhanger “Exodus” (2001)). That nice round figure equates to maximum warp being 9,000 times the speed of light, that is, the Enterprise would travel 9,000 times the distance of light per year at Warp 9. There is no indication whether the ship gains speed over time, but Warp Drive has always been visually presented as instant, inertia-free, time-dilation free, FTL acceleration and stopping, with constant speed.

What Warp Drive actually is, is whatever ‘magic transport’ is necessary for each story. See Roger Ebert comments on Star Trek 2009, *ut supra*, p. 848.<sup>3</sup>

---

*“Before Game of Thrones, George R. R. Martin wrote Tuf Voyaging, the darkly comic tale of a solo space traveler zipping from planet to planet with his own unique brand of problem solving. His magic weapon? Mushrooms. As far-fetched as it sounds, fungi are the perfect long-distance travel companion. In the right environment, spores keep indefinitely and are small enough that you could pack an entire farm on a postage stamp. Looking toward to the future and our inevitable trek to the outer reaches of space, mushrooms might just be the ticket we need to get off the planet....*

*And psychedelic fungi could do more than help pass the time on these long voyages. ...*

*These substances might even help us stay young or slow the aging process... The mushroom’s ability to cope with space’s weird atmosphere, their positive effect on our health and wellness, ease of growth and never-ending appetite make them the ideal candidate to join our race to outer space. Perhaps someday our great grandkids will be sitting on a seat made of mycelium fibers, munching a mushroom ‘pepperoni’ pizza, hurtling through space on a high-octane fuel of ‘shroom juice.’”*

– Ryan Herron, “Spores in Space: These Mushroom Trips Last Light-Years,” Dope Magazine, August 11, 2017 <sup>4</sup>

---

## Endnotes.

<sup>1</sup> Commentary: Being on the deep ocean on a safe US Navy transport ship for a time gives only a hint of the vastness of outer space, the mental/emotional impact of a desert of water. Outer space is an order of magnitude more than being on the ocean, the ocean at least has a shore all around it, and air, sunshine, and life. And there is no zapping from one scene to another, instead, we spent days stretched out on and around the sundrenched helo-pad, as we were merely cargo. I remember that I quietly read John Gibbin’s In Search of Schrödinger’s Cat: Quantum Physics and Reality (1984) on deck, on the voyage to Subic Bay. Whether I *grokked* what I was reading is another matter entirely, but I thought I did then. A couple of days on the waves gives some small appreciation of those who fought in the island-hopping campaign in the Pacific Ocean theatre of WWII, the wonder and the terror.

<sup>2</sup> Citation & Commentary: [In a Soyuz Capsule docked to the disabled Salyut 7 Space Station] **Viktor**: You are a crazy psycho. **Vladimir**: But we docked. **Viktor**: I refuse to continue this mission with you. **Vladimir**: Viktor, do you have a choice? – from *Salyut 7* (2017, Russian language with English subtitles).

- ✓ This is not completely analogous to the Cooper situation in *Interstellar* (2014) because it was not literally impossible, but it was very, very difficult and the people on the ground *had concluded that it was impossible* and the risk of total loss at that speed was too great and were about to call off the mission.

<sup>3</sup> Commentary: This is exactly what drives me bonkers about the internet: A movie like *The Conclave* (2006) – factual, absorbing and historical – is hardly mentioned or looked at by critics and review sites, while *Star Trek 2009* – unfaithful to the franchise whose legacy it bears with characters in name only – is almost universally praised (except by Roger Ebert) for being loud, dumb, and colorful and oh-so-franchise familiar.

- ✓ The same is true of GGDM vs. any regularly overhyped tabletop or video game release.

<sup>4</sup> Commentary: No, I didn't make this up. It's not a misprint or editing mistake. You can find it online. You can stop spacing now. ☺

On the serious side, there are a decent number of articles online about experiments with mushrooms in space and it is a topic of interest to science. In “Why fungi adapt so well to life in space” (ScienceLine, March 7, 2018), Matthew Phelan tells the story of astronaut David Wolfe discovering an infestation of fungi behind a panel on the Russian Space Station Mir in 1997. He continues:

- ✓ “Fungi nearly wrecked Mir on multiple occasions. For example, fungus found on one of Mir’s Soyuz transports, the variety of spacecraft used to ferry personnel to and from the orbital platform, was once caught eating away at the hardened quartz glass of the vessel’s viewports. It etched webs of cracks and corroded the rubber seals connecting the windows to their titanium frames. Mold (a variety of fungus) became so widespread that cosmonauts and their international colleagues would return to Mir to discover that the whole place smelled like a basement full of rotten apples, as noted in the January 2016 issue of the Russian edition of *Popular Mechanics*.” *Id.*

Tristen Wang in the Harvard Science Review article, “Astromycology: The ‘Fungal’ Frontier” (June 2, 2015):

- ✓ “The discipline of astrobiology attempts to answer the larger mysteries about life: its origin, necessities for survival, and presence in other worlds. But astrobiology also has practical applications in considering how biological organisms may travel through space. In particular, human space travel would greatly benefit from studying a branch of fungal biology known as astromycology: the study of earth-derived fungi in space. Fungi offer both an opportunity and threat to human space travel. Problems arising from fungal intruders are both wide and relevant, ranging from providing food and decomposing biological material to breaking down spacecrafts. Interactions of intense radiation and lack of gravity with fungal growth underlie the opportunities and threats that fungi pose to human space travel.” *Id.*

*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*

*“At an intersection of pathways in slipstream space, both paths manifest the potentiality of being correct and incorrect. It’s only when the pilot chooses a specific direction that this potentiality collapses and one path becomes right, and the other wrong. For reasons still not completely understood, organic beings tend to choose the correct paths, or more precisely, the very act of choosing makes the path they have chosen the correct one.”*

– The Andromeda Wiki article, “Slipstream,” captured May 28, 2018 <sup>1</sup>

**Ship Systems:** Ship Systems is an Existential Patent that represents the life support, crew accommodations, and general logistical aspects of interstellar flight. The practical limitations of interstellar flight are how much supplies the ship can carry, how quickly they are consumed, and the extent to which the ship systems can recycle supplies in interstellar flight and/or replace them from raw materials when they arrive in a system which does not have a supporting colony. Some items, such as high-end manufactured or refined items, especially those required for the operation of the Stardrive, will be impossible to replace without a supporting colony; the Stardrive is the single most complicated and finely-tuned device ever manufactured, and a piece of duct tape just won’t fix it. Without this patent, a ship has no turns of OFL/OSL (*ut infra*), cannot move away from a Supporting Colony and, *except for Scout Ships*, cannot even be constructed (because it’s system integral).

- ✓ GGDM *does not* begin with the assumption of any Star Trek like ‘replicator’ technology and even in Star Trek there are limits (e.g., see Star Trek: Voyager), especially if the ship is damaged, and even in Star Trek, there are damage levels that cannot be repaired without putting into a space station or orbital shipyard.
- ✓ There is a maxim which is old because it is worth repeating each generation: ‘Amateurs talk about tactics, professionals talk logistics.’<sup>2</sup> One of the endless litany of historical examples supporting the adage is the 12<sup>th</sup> SS Panzer Division’s operations in Normandy in 1944: Their battalion of Panther tanks ran out of fuel before reaching the battlefield due to sloppy staff work (see Moltke discussion, 5 Combat, p. 1008, *infra*) and logistic failure. The late-war 12<sup>th</sup> SS Panzer never cohered well.<sup>3</sup>
- **Life Support:** The Ship Systems Existential Patent is required for interstellar flight. The Ship Systems Existential Patent governs both Operational Flight Limitation (OFL or “offal”) and Operational Supply Limitation (OSL or “ossal”<sup>4</sup>), detailed in the following sections. The Patent contains turn limits for each individually, beginning at two Regular Turns each. The individual limitations may each be improved by means of a Continuous Operational Technology or Enhancement Technology Patents, with each improvement being no more than one turn for either the OFL or OSL, per COT or ET Patent.
  - ✓ The one Regular Turn per step improvement scheme is similar to improvement of Ship Speed (see Dog Star, 2 Stardrive, p. 792, *supra*). Each improvement of Operational Flight Limitation extends the range of ships by the current maximum Ship Speed at time of departure.

- Imperial Interstellar Scout Service: Scout Ships are *non-warships* with big sensors and small highly specialized crews that are designed to go anywhere, seeking out new life and new civilizations ... well, you know the official party line propaganda already ... but really they are more interested in claiming resources, powerful alien artifacts, rhinestone shades and cheap sunglasses, easy Earth girls, and living space first. See Scout's Honor, 1 Expansion, p. 879, *infra*, for full discussion of Scout Ships. With a small crew and a big/small self-sufficient ship, the supplies can last a long time. Scouts are the only ships that may be constructed without a Ship Systems Existential Patent. *With a Ship System Existential Patent*, Scouts have *two extra turns* of Operational Flight or Supply Limitations (OFL/OSL), and may depart for any destination system, without it, they have two turns of OFL/OSL.
  - ✓ There is also a distinct possibility that Scouts are drones or Von Neumann machines. But this then dives into arguments about sapient understanding and decision making vs. AI and whether the potential for First Contact should be handled by an AI Scout or a biological sapient. This is a finer issue for the participants, the game will only look at the issue when necessary. I recommend reading Fred Saberhagen's "Ber-serker" stories. See previous discussion in relation to Faculties use, Web of Night, 2 Colleges, pp. 477-478, *supra*. See also the AI Problem excerpts, Corporations, *infra*.
  - ✓ On the level of game design discussion, the rare position that does not begin the game with the Ship Systems Existential Patent, can at least vigorously Scout the local stars while getting the necessary Patent. But to do this, they must begin with the Generic Stardrive Existential Patent as no ships can be constructed without it. Scout Ships do not require an Orbital Shipyard to build.
- Operational Flight Limitation (OFL): Operational Flight Limitation (OFL) is the number of Regular Turns of interstellar flight that a ship can travel when making a Long Movement ***beginning from a system where there is a supporting colony***, regardless of whether there is a supporting colony at the destination. The basic Operational Flight Limitation is two Regular Turns. Operational Flight Limitation generally becomes less of an issue as ship speed improves, because the range of the ship is however far it can travel at full speed in the time allowed by the current OFL.

With higher ship speed, the frontiers open up impressively (however, note again that temporal Disturbance Modifiers are particularly troublesome to the OFL by adding turns to the flight). Because it is usually irrelevant whether the destination has a supporting colony, OFL applies to the conditions precedent of all Power Activations that initiate interstellar flight, not just activation of the Movement Power. Cargo Ships, which must have a supporting colony at the destination as condition precedent to moving, may use an **alien colony** for OFL if trading with the **alien colony** (see Cold Lunch, 1 Commerce, p. 1189, *infra*). COT Patent improvements in OFL technology will not affect ships *en route* at the time of the improvement.

- ✓ It is *imperative* that the initial Starlog contain 2-4 stars within two turns' movement of each starting position based on the movement formula and starting ship speed of the Generic Stardrive Existential Patent. Other stars should be reachable from there.
- ✓ The stark contrast between U.S. Navy submarines and Japanese Imperial Navy submarines in WWII demonstrates the long effect of Operational *anything* Duration. U.S. submarines had greater operational range and duration than cramped, smaller Japanese submarines, and were also more numerous, and once the problems with U.S.

torpedoes were fixed by reverse-engineering of Japanese torpedoes, U.S. submarines were operationally superior. Added to that was the fact that U.S. codebreakers had deciphered the Japanese communication codes (unknown to the Japanese) and a rapid increase in proficiency and improved tactics (e.g., Colleges in GGDM), tilted the underwater war against the Japanese, who took unsustainable losses to their vital merchant marine.<sup>5</sup> Modern nuclear submarines can stay submerged for 3 months.

- Operational Supply Limitation (OSL): Upon arrival in a system with a supporting colony, the ship is automatically fully resupplied and may depart again with a fresh Operational Flight Limitation (OFL) or remain indefinitely in the system (this is an assumption purely for game purposes and may not accurately reflect the apparent facts).<sup>6</sup> If the destination system does not have a supporting colony, then Operational Supply Limitation, *the amount of time a ship can operate without a supporting colony in the absence of supply from a Log Ship (ut infra)* – including subsequent interstellar flight to a system where there is a supporting colony – begins to run. While it is certain that the ship could replace some of its supplies from raw materials in the system, as outlined above, eventually there will be some problems. Log Ships are not themselves exempt from Operational Supply Limitations.

- ✓ OFL ends upon arrival in the destination star system, regardless of whether there is or is not a supporting colony. Unused turns of OFL *do not* convert to extra turns of OSL or toll OSL from running. OSL should always be equal to or greater than OFL in operational turns, so that the ship arriving in a system without a supporting colony can immediately retrace its route back to a supporting colony (running on OSL time). If a non-Scout Ship is going to a system without a supporting colony, *the owner should be prepared to drop a Scene there after arrival*. For each turn that OSL is greater than OFL, the ship might spend those extra turns in the unsupported system doing whatever it came to do (e.g., kidnapping Elvis) before being required to return to a supporting colony or leave on a longer trip. Planning is key.

It is thus possible to abuse OSL slightly to allow ships that arrive in an unsupported star system to make a second flight that is longer than would have been allowed by the OFL (for example, ‘bridging’ long distances between colonies by passing through an unsupported star system). OFL + OSL effectively makes the combined flight time of a ship to and from or through an unsupported star system. The OFL is still the limitation on the first leg of the journey, and the second leg *must go* to a destination with a supporting colony, not off into the night.

- Death Ship: Does it need to be said? Absent creative Concierge Intervention (did the term “divine intervention” jump to mind?), a ship which has exhausted its Operational Flight and/or Operational Supply Limitations and/or has not arrived at a supporting colony or has failed its Supply Roll (*ut infra*), will perish and may be removed from the universe (if in interstellar space), or left there to be rediscovered later as a floating derelict. Maybe the elderly remaining crew or their bones will be found by beacon on a local planet or moon?
  - ✓ “Death Ship” is the name of a Season 4 episode of the original Twilight Zone, starring Jack Klugman and Ross Martin that is memorably peculiar even by that show’s standards. Seasons 4 and 5 featured three classic spaceship crash episodes, “Death Ship,” “On Thursday We Leave for Home,” and “Probe 7, Over and Out.”

*“Unobtainium is engineering jargon for, ‘a material that would be perfect for our purposes, if we could get it, which we can’t.’ Sometimes an object that actually exists, or existed at one time, becomes unobtainium because it’s unavailable now. When used in the realm of fiction, Unobtainium is usually the exotic material that is needed to make the Applied Phlebotinum of a given story work. Without it, all your nifty machines and plot-enabling gadgets quit functioning.*

*Some forms of unobtainium are based on real physics, but beyond the current scope of human engineering, such as room-temperature superconductors; they would revolutionize just about every form of technology, but they are not in and of themselves dangerous or based on some exotic physics-bending principle.” – from TVTropes.com, “Unobtainium”*

**Unobtainium:** Meanwhile, back at the space station...

- ✓ “Phlebotinum is the versatile substance that may be rubbed on anything to cause an effect needed by a plot. Examples include but are not limited to: nanotechnology, magic crystal emanations, pixie dust, and Green Rocks. In essence, it is *plot fuel*.” – from TV Tropes.com, “Applied Phlebotinum” (emphasis added).
  - See full quote, Assumptions of Light, 1 Stardrive, p. 781, *supra*.

Although fuel might more properly be a consideration of the Stardrive Patent, it is assumed under the OFL/OSL of the Ship Systems Existential Patent. The game makes no separate or specific accounting for fuel other than OFL/OSL. In most cases, it is assumed that the Stardrive is also the power plant providing energy to the rest of the ship for all other systems. If participants want, they can track fuel separately and this could add another layer to the game as not all colonies will have available refined fuel for Starships, fuel would need depots.

- ✓ See Large Convenient Energy Source (LCES) feature quote (“Abusing the Kardashev Scale”), Research Areas, 2 Technology, p. 701, *supra*.

Thus, if participants want to guarantee that wars will occur in their game, they could possibly do no better than to introduce scarce fuels into the game that are vital to interstellar movement, creating the feedback loop:

- ✓ A 15-minute movie criticism video published in April 2016 by Media Zealot titled “6 Advanced Sci-fi Civilisations Too Stupid To Really Exist (Part 1)” makes this same point with regard to the humans in Avatar, which the video criticizes as too stupid to have advanced to interstellar civilization. The video points out that the humans are in a feedback loop; they must expend fuel and resources to find more fuel, and choose to go to war with the indigenous natives on Pandora, ignoring and destroying countless scientific wonders and potential advances, to get fuel – instead of finding sources located on uninhabited planets. Humanity in the movie is cognitively one-dimensional, they see only profits. The other civilizations roundly criticized are the Engineers from the Alien franchise and the alien invaders in Battle: Los Angeles (movie, 2011).

This also assumes that such fuel is naturally occurring throughout the universe and no one has devised a way to manufacture it; e.g., like crude oil on Earth in the 20<sup>th</sup> Century. Manufacture of

any such fuel would require more energy input – since the fuel is simply an energy storage device – than could be obtained from the fuel when used (unless extradimensional). Thus, manufacture of advanced fuels, other than those that can be produced biologically, has eluded us.

➤ No Blood for Uranium: Oil is the “Applied Phlebotinum” of modernity, *it is the plot fuel of the 20<sup>th</sup> Century*. Imagine warfare with coal-fired, steam-driven Panzers in 1939?

- ✓ “In the spring of that year Guderian had his first experience of commanding a panzer force during the annexation of Austria. The mobilization was chaotic, tanks ran out of fuel or broke down, and the combat value of the formation was non-existent. Had there been any real fighting Guderian would certainly have lost. He stood beside the Führer in Linz as Hitler addressed Germany and Austria in celebration. Afterwards, he set about remedying the problems that the panzer force had encountered.” – from Wikipedia article, “Heinz Guderian,” captured November 19, 2019.

Some in this oil-driven, oil-crazy world might consider it a serious design flaw in the game to have excluded fuel tracking from the calculations.

- ✓ “Despite the effort put into developing a fleet capability to execute the drive across the Pacific called for in War Plan Orange, the first major large-scale assault conducted across an ocean without a forward operating base occurred in the European theater – Operation Torch, the invasion of North Africa. More than 100 ships were refueled by five oil tankers and four *Sangamon*-class escort carriers that were converted *Cimarron*-class oilers.” – Commander John A. Lukacs IV, USN, “A Century of Replenishment at Sea,” CNO Naval History Essay Contest 2017, pub. August 8, 2018 on [www.history.navy.mil](http://www.history.navy.mil).

In 1961, the USS Enterprise (CVN-65), the first nuclear-powered aircraft carrier was launched, and the USS Nautilus (SSN-571), the first nuclear-powered submarine, had been launched in 1954. Nuclear powered ships could run for 20-30 years on the initial fuel (the former was decommissioned in 2017 and was last refueled in 1994, the latter was decommissioned in 1980), thus effectively putting off to the next generation, the problem of refueling these ships when it may have been assumed that they would either be obsolete or that technology would have advanced such that the process would be less difficult. This provides a frame of reference for the amount of energy contained in a tiny bit of uranium. Thus, the problem is one of scarcity and consumption rate; I have not yet seen any protestor signs that say “No blood for uranium!” though it may be coming.

➤ Scooping: Science-fiction writing has been very inconsistent on the issue of starship fueling.

- ✓ In the Traveller RPG and in the movie *Magellan* (2017) starships can get fuel from gas giants (skimming/scooping) or from water worlds, or in the case of the movie *Magellan* (2017), a fuel line was run to a frozen hydrogen-nitrogen ocean. In Traveller RPG, massive battle fleets would refuel at local gas giant planets and I wondered if eventually a gas-giant planet in a busy system might have all of its atmosphere taken by starships? In the series *Stargate Universe*, the ancient alien ship *Destiny* scooped from the surface of a star. Incidentally, in *Songs of Distant Earth* (1986) by Arthur C. Clark, the space-ark ship *Magellan* wasn’t stopping at the colony for fuel, but for water to make ice to rebuild its forward shield against interstellar dust and rocks.

- ✓ In Battlestar Galactica, the fuel used is a very rare metallic ore Tylium (Battlestar Galactica Wiki); one must assume that the Twelve Colonies had a supply source somewhere (according to BattlestarWikiClone, it was not native to the Twelve Colonies), but it makes starship operation very expensive. In the original series, I do not believe the fleet ever ran out of Tylium (the wiki said it was hardly mentioned in the original series), but in the reimaged series, the writers couldn't resist the easy 'plot fuel' temptation (arguably, FTL must be a massive energy drain thus it takes time to recharge the FTL), so the Colonials had to attack the Cylons in the "Hand of God" (2005) to obtain Tylium from an asteroid.
- ✓ Conversely, in other science-fiction settings, such as Star Trek, the ships were powered by matter/anti-matter reactions (Deuterium/anti-Deuterium). The particulars of anti-matter (anti-Deuterium) generation were never discussed (since anti-matter theoretically cannot exist – BOOM!) except to say the obvious, that there would always be more matter than anti-matter. The flow reactions were controlled by fictional dilithium crystals (not to be confused with the real dilithium) which was a component as critical to the system as anti-matter to prevent the ship from exploding, thus two of the three items needed for Warp Drive were *unobtainium*. This was plot fuel for a few episodes that were *parodies* of Cold War oil tensions. Notably, Star Trek limited dilithium crystals to starship propulsion and didn't it make into Applied Phlebotinum.
- ✓ However, in the Stargate universe, a magic-everything mineral called Naquadah, "a rare, super-dense mineral," which is also a superconductor, is used for every possible purpose: explosives, fusion reactors to power ships, small generators, as armor, as a blood supplement, can be liquefied to work in small handheld weapons, to make star-gates, ship hulls, and as currency in interstellar exchange (from Stargate wiki). Naquadah is the combined Unobtainium and Applied Phlebotinum of Stargate.

Arguments that fuel consumption should be included in GGDM logistics are really arguments for the introduction of 'plot fuel' to the game, if the participants do not already have enough to drive the story. Even when couched in 'realistic' terms, as a necessary realism to make the GGDM (or any sci-fi) setting credible, what is actually meant, is that the game needs 20<sup>th</sup> Century plot fuel. TV series writers, still living in the 20<sup>th</sup> century and not yet comprehending the consequences of nuclear-powered submarines and carriers, cannot resist adding 20<sup>th</sup> Century plot fuel.

Yes, there are two paths you can go by (snorting dilithium crystals or drinking liquid naquadah), but once a game of GGDM is started, it will be difficult to change the road you are on. For design simplicity and from the comprehensive view, GGDM chose not to track fuel. But participants can add it if they wish another layer of complexity.

---

*"In late 1944, Admiral Raymond Spruance had begun preparing to bomb the Japanese Home Islands to eliminate the air threat to the planned invasions of Iwo Jima and Okinawa. He realized that the primary hurdle to keeping his 12 aircraft carriers and associated escorts on station would not be fuel but rather ammunition. It would take only three days for the ships to expend their ordnance, after which they would have to make a 2,000-nm, 12-day sail to Ulithi Atoll and back – meaning only six days of bombing could occur per month.*

---

*Admiral Spruance directed the development of a method for transferring ordnance and stores at sea, ultimately approving the Burton Method (named for the development team's leader, Captain Burton Biggs), an adaptation of the pier-side process that used existing cargo winches on both the delivery ship and aircraft carrier. On 23 February 1945, the USS Shasta (AE-6) conducted the first underway ammunition replenishment, by breaking ammunition out on deck by hand – including rolling bombs across the deck – and then levering it to the USS Bennington (CV-20)."*

– Commander John A. Lukacs IV, USN, "A Century of Replenishment at Sea," CNO Naval History Essay Contest 2017, pub. August 8, 2018 on [www.history.navy.mil](http://www.history.navy.mil) <sup>7</sup>

**Logistical Support Ships:** Ships which are in a system without a supporting colony may be supplied from Log Ships if they are carrying *Supplies*. "Log Ship" is short for Logistical Support Ship, and Log Ships may only be constructed after successfully acquiring or prosecuting the Logistical Support Ship Existential Patent. Log Ships cost 15 RPs each to build, Orbital Shipyard required; they are constructed in the same way as any other starship.

- ✓ Log Ships may never use anything they are carrying except *Supplies*. Log Ships are never required to use *Supplies* to extend their own OSL.
- **Sutlers not Settlers:** The Logistical Ship rules are written on the assumption generally that they are owned by the government and are part of a regular, controlled supply system of a modern naval force or army. See Nationalist Armies discussion, 4 Colleges p. 502, *supra*. For most of history, however, soldiers were often required to supply their own kit and bring or purchase their own provisions; sutlers were merchants who followed the army and sold provisions to the soldiers (just as legend has it that "hooker" as a name for a prostitute came from those who followed General Hooker's army in the American Civil War, and who is to say there wouldn't be a class of professional ship prostitutes?<sup>8</sup>). However, should Logistical Ships and/or supply become the operation of a Corporation (see Corporation Games, 1 Corporations, p. 1243, *infra*), they might be considered sutlers in GGDM. On the other hand, positions in GGDM represent the government and Native Population Type nearly inseparably, so anything built or owned by the position *might be said to be owned both by the government and the civilization*.
  - ✓ If players believe and treat GGDM Regular Turns as representing multi-generational periods, Combat Rounds may represent a generation and each warship and Log Ship may be also a seed ship, familial generation ship of sorts, hatchery, or regeneration chamber. Luckily, Supplies do not 'age-out.'
- **Take Your Protein Pills:** Log Ships may carry four types of items: *Supplies*, Fighters, expendable Enhancements, and Ship Missiles. *Supplies* is a generic term that is used to abstractly represent all of the types of items that a starship needs (including replacement crew), except replacement Fighters and Missiles, and expendable Enhancements.

The capacity of a Log Ship to carry Supplies, Fighters, Missiles and Enhancements is measured in the RP value of what it can carry, and their initial capacity is detailed on the Logistical Support Ship Existential Patent. Like other PIT Patents, the 20 RPs capacity of 1<sup>st</sup> Era Log Ships are capable of being improved by use of COT and ET Patents and it is also possible to create specialized classes of Log Ships that carry only one type of resupply item and/or

possibly perform additional services. Log Ships may not load or transport RPs, those may only be transported by Cargo Ships,<sup>9</sup> nor may they be used to transport population.

- ✓ Log System Boats and Log Tenders are possible, see System Boats, 3 Construction, p. 677, *supra*. Their practicality may be circumstantial.

- Empty Cans: Log Ships *may not be used* to supply Colony Transports or any sort of Colony Ship or ship carrying population (other than Ground Units, see Beans, Bullets & Bandages, 4 Combat, p. 988, *infra*); it is just beyond their capacity to provide that much supply. Non-supply of Colony Ships is a rule for game convenience and to keep the logistics somewhat realistic.<sup>10</sup> Beyond this is a maze of ambiguities about the time length represented by Regular Turns, how much a population factor represents, and the technologies and capabilities involved in Colony Ships (e.g., are they in stasis? are they eggs?), OFL/OSL and Log Ships. Though it might be possible to eventually allow Log Ships to supply Colony Ships, this ability should be developed at great cost and consideration.

Page | 861

The primary purpose of Log Ships is to supply warships in systems without a supporting colony; *they are the symbol of the financial cost of power projection in GGDM*. OFL represents the operational range of warships and colony ships not going to destinations with a supporting colony. Warships can remain indefinitely in a system as long as Log Ships provide *Supplies*.<sup>11</sup> However, Log Ships also carry and deliver enhancements (from Enhancement Technology Patents, e.g., Fighters, Missiles) to any eligible ship, base, colony or installation.

- ✓ If nobody builds warships, nobody needs to build Log Ships. Right?

Colonies are assumed in GGDM to be self-sufficient, so whether a Log Ship can supply a colony is a moot question and no rules are provided for it. However, should the drama of the story unfold so that a colony needs to be supplied (*à la* the Berlin Airlift), Log Ships might keep a small colony supplied below domestic subsistence levels for a short while, and the participants will need to wing it on the rules for this.

- ✓ My mother used to call empty jugs and large bottles, “dead soldiers” when I was young. She is the only one I have ever heard use that term. But if you Google “dead soldiers definition,” the result comes up in Wiktionary and a half-dozen non-mainstream dictionary sites.

- Running Outatime: Transferring *anything* from Log Ships may only occur if both the Log Ship and the other ship or colony are in the same system *at the beginning of the Regular Turn*. Recall that ships conducting Short Movement (or ‘heroic movement’) arrive in the destination system on the same Regular Turn they departed the origin, that is, before the beginning of the next turn. So they could begin the Regular Turn in the same system as the target ship or colony.

Ships making Long Movements arrive before the first Power Activation of the turn, but would not be in the same system as the target ship or colony *at the beginning of the turn* of their arrival. See Long Jump, 2 Movement, p. 851, *supra*. However, arrival before the first Power Activation still allows Log Ships to receive Supplies and Enhancements from colonies using the Construction Power Activation (see Costly Resupply and Transfers, 3 Construction, pp. 679-680, *supra*) or perform other tasks.

- ✓ Hugh de Cressingham, a French-speaking knight serving as the King’s Treasurer in Scotland, accompanied the English army commanded by the Earl of Surrey in 1297 to

put down the Scottish revolt led by Wallace and Moray. Hugh was hated by the Scots and not liked by the English.<sup>12</sup> One of the stories surrounding the English defeat at the Battle of Stirling Bridge, is that Sir Hugh was impatient with the *cost per day* of keeping the English army (plus Scottish defectors) in the field, and he convinced the Earl to make an ill-advised, tactically disadvantageous attack across the wooden bridge against Scottish infantry on the heights on the other side of the river. Hugh was upset with the Earl's delays and wanted the matter concluded quickly; he was killed and his body mutilated while leading the attack across the bridge while the Earl remained with about half of the English force on the other side of the bridge. As the Earl retreated south after the battle, many of the Scottish defectors reverted to the Scottish side and attacked the English supply train at The Pows marsh.

Time is important not only in timing, but in cost per Regular Turn to keep ships, boats, and Ground Units supplied. It is probable that most situations will be decided by supply and cost considerations in equal or greater measure than other factors of the moment, combats will be short and brutal, colony sieges will be expensive and time consuming.

- Running on Empty: The transfer of anything from a Log Ship never occurs automatically in a non-combat situation (thus, the position that fails to submit Actions may lose ships), and it occurs before the first Power Activation of the Regular Turn, and should be included in the position's Regular Turn Actions when submitted to the Concierge.
  - ✓ Transferring anything *from* a Log Ship does not require a Power Activation.
  - ✓ Transferring anything *to* a Log Ship *from another ship* does not require a Power Activation.
  - ✓ Transferring anything *to* a Log Ship (or any other ship) *from a colony* requires an activation of the Construction Power for the purposes of Ship Supply (see 3 Construction, Costly Resupply and Transfer, pp. 679-680, *supra*).
  - ✓ Ships receiving Supplies from Log Ships do not have to make a Supply Roll if they have exceeded their OSL on the Regular Turn they receive Supplies (*ut infra*).
  - ✓ Log Ships will automatically consume their own Supplies to avoid Supply Rolls if they have exceeded their own OSL unless otherwise indicated, and all Supply Rolls are made after Supplies are distributed to other ships, so Log Ships could be forced to make Supply Rolls to keep other units supplied.
    - Taking job applications for Log Ship crew positions...

If a Log Ship can give up all of its *Supplies* to prevent three other ships from making Supply Rolls for a Regular Turn, but the Log Ship then has to make a Supply Roll that might not be a bad bargain.

- ✓ “Underway replenishment was the U.S. Navy’s secret weapon of World War II.” – Fleet Admiral Chester Nimitz, U.S. Navy.
- Limping Home: Nothing can be transferred or supplied to other ships while in interstellar flight, transfers may only be accomplished when the ships are in a starsystem together. However, Supplies may be transferred at any time before Operational Supply Limitation expires and the early transfer and consumption of supplies *tolls the running* of the OSL limit for the supplied ship for that turn (that is, the turn in which the supplies are transferred to the other

ship does not count against the OSL), such that it becomes possible for the ship(s) to make it back to a supporting colony before their OSL expires. In short, Supplies buy extra OSL. A Log Ship may only transfer one turn of supplies to each ship each Regular Turn and cannot leave supplies (or anything) in cold, irradiated system space to be picked up; a Log Ship cannot dump and run; however, this is an area that might be improved by Colleges or Patents.

A ship in an unsupported system that has expired OFL and OSL can be kept alive indefinitely turn by turn by being supplied by Log Ships. Supplies are transferred at the beginning of the turn, so the ship would need to be able to reach a supporting colony in one Regular Turn of movement (a Short Movement) before having to make Supply Rolls in flight. Log Ships cannot transfer Supplies by accompanying the ship during movement. At some point, a ship with expired OFL/OSL will either need to be abandoned, or a colony established in the system, or it will need to take chances on Supply Rolls to reach a supporting colony.

➤ A Hot Dinner: No ship may transfer remaining Regular Turns of OSL (or OFL) to any other ship, and only Log Ships may transfer *Supplies*. Cargo Ships cannot transfer RPs to other ships (or System Boat) to be used as *Supplies* (or for any other use). The RP cost of supplying a ship for one *Regular Turn* is 10% of the base construction cost of the ship plus the *current* RP value of any Fighter Complement (or System Boats). Transfer of Supplies *are never required or allowed* during Combat Rounds; this should not be confused with Combat Re-supply of Fighters, Ship Missiles and Enhancements described in 4 Movement, p. 868, *infra*.

- ✓ A 1<sup>st</sup> Era Log ship fully loaded with *Supplies* (20 RPs) can support 200 RPs of ships, boats and fighters for a Regular Turn beyond their OSL.
- ✓ This is a completely arbitrary value and not based on any real world data, though it would be interesting to see, for example, how much it costs the U.S. Navy per year to operate the USS Little Rock II as compared to its \$440 million USD construction cost. That said, GGDM is rather fuzzy in many areas – such as actual time – and is a science-fiction setting, many things are assumed to occur for accounting purposes, without cost, so the 10% of value is not a huge stretch and should not be reduced quickly or easily by Patents or other means.

System Boats on Tender Ships could be treated as Fighter Complements for this purpose; that is, while the Tender is within its OSL, the System Boats are assumed to be supplied by the Tender, but if being supported by Log Ships, the System Boats are supported at their base construction cost in RPs (and System Boats are a lot cheaper than starships so this is an interesting option in logistics). System Boats whose supporting colonies have been destroyed or captured require supply from a Log Ship or they will perish, as they have no inherent OSL. See System Boats, 3 Construction, p. 677, *supra*.

- ✓ A Log Ship that, at the *beginning* of the Regular Turn, supplies units in any ongoing combat, except Ground Combat, will automatically join the combat, see Victuals & Vitals, 3 Combat, p. 975, *supra*, unless it initiates interstellar movement on the same Regular Turn (possible when arriving by Short ‘heroic’ Movement – arrive end of previous turn, supply, jump out).

The supplies are subtracted from the Log Ship at the beginning of the Regular Turn. An empty Log Ship still has its own OSL, and does not need to make Supply Rolls until its OSL expires, but cannot transfer its remaining turns of OSL to any other ship.

- The Cold Equations: The Concierge will (attempt to) keep track of the Operational Supply Limitations of ships; player assistance and honesty would be appreciated if the Concierge misses any detail (likely, this bookkeeping can be better performed by a computer assistant).

Since a ship (theoretically) may never leave for a destination star whose travel time in Regular Turns exceeds its Operational Flight Limitations (and there is no FTL resupply) including known Temporal Disturbance modifiers, there is no need to track the OFL of a ship.

Scouts should be used for exploration (having two extra turns of OFL), but it is possible that sometimes a non-Scout ship may run out of OFL and perish going to an unexplored system that has a Temporal Disturbance Modifier.

- ✓ Any ship which has exceeded its Operational Supply Limitation (*including* during interstellar flight to a supported system) must make a Supply Roll on one ten-sided die prior to the first Power Activation of each Regular Turn, if the die roll result is less than or equal to the total number of rounds the ship has been out of supply plus 2, it is destroyed instantly for lack of supply. Note that an unlucky ship can be destroyed on the first Supply Roll if the result is ‘1,’ ‘2’ or ‘3.’
- ✓ Any ship, except Scouts, which departs from a system without a supporting colony may only have a destination system assigned which has a known supporting colony.
- ✓ If all supporting colonies in the destination system are eliminated or captured prior to the arrival of the ships *en route* from an unsupported system, those ships must make Supply Rolls on subsequent turns if they have exceeded their OSL and are not supplied by Log Ships. The ships may automatically initiate combat (at the discretion of the Concierge, based on the situation) without the need for a Combat Power Activation, if the ships (or System Boats) are capable of combat, to try to liberate the supporting colony (if it still exists).

There is a dynamic between OSL and Log Ships; the longer the OSL, the less need there is for Log Ships. Exceptional OSL capabilities later may render early game Log Ships obsolete. On the other hand, some positions may determine that it is cheaper or better to build new ships than to keep supplying unsupported ships, or that they will take their chances on Supply Rolls each turn. Log Ships cannot help or extend OFL but benefit from it.

- ✓ “The Cold Equations” is the title of a classic brutal two-people-in-a-room sci-fi short story by Tom Godwin,<sup>13</sup> published in *Astounding Magazine* in 1954. It was made into a not-well-received TV movie in 1996, from a 1989 *Twilight Zone* episode that was based on the short story (neither of which I have seen). I found the complete short story available free on the internet in PDF or in webpage format, on several sites in June 2018. I read it an anthology long ago and recommend reading it.
- Hollow Logs: You never know what you will find inside a hollow log, but the list of things you won’t find is fairly short and to the point. Empty Log Ships may be refilled at any eligible colony by activation of the Construction Power at that colony for the purpose of Ship Supply during any turn which the Log Ship began the turn in the colony’s starsystem.<sup>14</sup>

*“Long ago, the peaceful population of the planet of Krikkit, unaware of the rest of the Universe due to a dust cloud that surrounded its solar system, were surprised to find the wreckage of a spacecraft on their planet. Reverse engineering the vessel, they explored past the dust cloud and saw the rest of the Universe, immediately taking a disliking to it and determining it must go. They built a fleet of ships and robots to attack the rest of the Universe in a brutal onslaught known as the Krikkit Wars, but were eventually defeated. Realizing that the Krikkit population would not be satisfied alongside the existence of the rest of the Universe, it was decided to envelop the system in a Slo-Time envelope, allowing Krikkit to survive long after the rest of the universe has ended; the Wikkit Gate was the key to the envelope.”*

– from Wikipedia article, “Life, The Universe, and Everything,” captured August 15, 2019<sup>15</sup>

**Blinded by the Light:** Creatures evolved in the eternal brightness of the center of the galaxy would not – from our perspective, know darkness (unless they went underground). They would not be able to make out much of the other stars around them and would not be able to see beyond the glow of the galactic core; they would for the most part, be ignorant of the existence of other galaxies, the Big Bang, and the vastness of the cosmos. Science-fiction literature has not much discussed species evolved in the center of the galaxy – and the question of whether or not anything is even remotely possible has never been explored in any story (TTBOMK); instead, space-opera fiction assumes creatures like ourselves who evolved in the spiral arms of the galaxy. Likewise, galactic empire science-fiction trope dances around the core of the galaxy; it is never quite clear whether or to what extent the supposed galactic empire includes the core of the galaxy. Galactic Empires in fiction (including GGDM) can be largely assumed to exist around the rim, spiral arms of the Milky Way Galaxy.<sup>16</sup>

*“Light thinks it travels faster than anything, but it is wrong. No matter how fast light travels, it finds that darkness has got there first, and is waiting for it.” – Terry Pratchett*

## Endnotes.

<sup>1</sup> Citation: See wave function collapse discussion, Peek-a-Boo, 2 Expansion, p. 893, *infra*.

<sup>2</sup> Commentary: There is a saying commonly attributed to Sun Tzu that circulates freely around the internet: “*The line between disorder and order lies in logistics.*” I thought it was odd when I read it because while they must certainly have had an idea of supply sources and supply lines, I doubted that a concept comparable to modern logistics (similar to retroactively applying technology to prehistoric times) existed. I thought at the most, he might have said supplies and someone adulterated the phrase by putting in ‘logistics.’ It turns out he didn’t say either one:

- ✓ The quote in question appears to originate from a loose translation of a phrase from Chapter 5 Verse 4 of Sun Tzu’s book, which deals with coordination. Specifically, the relevant verse reads:

*‘Amidst the chaos of a sea of flags in the battlefield, order must be maintained. Even when the view is unclear, adherence to an army’s formation will ensure it cannot be defeated. Yet, **disorder can arise from order**, fear from bravery and weakness from strength. **Orderliness can be fostered (or instilled) via coordination**, bravery via the impetus of a situation and strength via training. A commander may stir an enemy (i.e. disrupt its formation) by misleading it with an enticement of a false advantage, from which point the enemy can be defeated by troops lying in wait.’*

Hence, the specific phrase that deals with order/disorder is in reality linked to the notion of coordination among the various combat units of an army, rather than the notion of logistics.” – S.H.G. (a logistics professional), “‘The line between disorder and order lies in logistics.’ Did Sun Tzu really say that?” LinkedIn Pulse, December 28, 2018 (italics and bold in original).

<sup>3</sup> Citation: Information from Wikipedia article, “12<sup>th</sup> SS Panzer Division Hitlerjugend,” October 5, 2018, citing to opinion of historian Marc Milner.

<sup>4</sup> Commentary: “Ossal” is the German word that translates as “osseous” in English, which means boney or ossified. You can read whatever meaning you want into it in relation to Operational Supply Limitations, but mainly, it just was similar to “offal” that represents OFL, Operational Flight Limitations.

<sup>5</sup> Commentary: What is presented here has been the classic historical analysis. There are many articles on the subject on the internet. There may be some revisionist arguments on small points, for example, regarding the Japanese 1<sup>st</sup> Class Submarines, and that codebreaking and industrial capacity had more to do with the U.S. submarine successes than individual submarine superiority. But the overall results were significant and undeniable.

<sup>6</sup> Commentary: OFL/OSL is the basis of Arthur C. Clarke’s personal ♥ novel, The Songs of Distant Earth (1986) which he took nearly 30 years to develop from the 1958 short story. This was a sci-fi trend of the early 80s, I bought (and still have) four Foundation books in hardback when Foundation’s Edge was published in 1982, 30 years after the original three Asimov novels. Maybe this is the ‘way’ things of this sort work, had GGDM been published as a short story in 1992-1993, the final version of GGDM in 2020 would be the novel over 25 years later.

<sup>7</sup> Commentary: In 1988, I watched U.S. Navy ships practice transferring casualties from ship to ship underway between Okinawa and the Philippines.

<sup>8</sup> Commentary: Perhaps something like the “furniture” in Soy lent Green?

<sup>9</sup> Commentary: A rather arbitrary distinction to be sure, but at the negotiations for the Sirius-Proxima Treaty of 13,013 GE (approximately 2,500 B.C. on Earth), the Log Pilot’s Union sought to avoid having Log Ships mistakenly shot at as Cargo Ships. In return, the Cargo Pilot’s Union negotiated a clause that allows warships to use heavy weapons and missiles on properly identified Log Ship targets, but not on Cargo Ships. It was this same treaty that, unbeknownst to our ancestors, made Earth the property of Deep Green. The Earth is primarily blue from space, of course, but the little green men are working hard to change that by guiding us toward industrial technologies that produce greenhouse gases and emissions that cause global warming. Their objective is to replace us with an advanced and enlightened global consciousness algae civilization.

<sup>10</sup> Commentary: I may be just a paralegal, but I won one in front of a judge by a practical legal logistics argument. We were defending a petition by the opposition to remove the case to New York courts. One of the prime witnesses in the case had refused to appear for depositions and had refused to cooperate even with his own counsel, despite being threatened with sanctions by the judge. I suggested an argument based on the difficulty of getting this indispensable, uncooperative, belligerent witness to appear in court in another state. The attorney who was then writing the response brief said, ‘Hey, that’s a pretty good argument.’ He included it in the brief as the third or fourth argument; when the judge issued an opinion and order, the very first reason he cited to denying the petition was my argument. The attorney said afterward, “Yours was the winning argument, it was the first argument the judge cited.”

<sup>11</sup> Citation & Commentary: “Napoleon recommended all soldiers to ‘read and re-read’ the campaigns of Turenne as one of the great captains. His fame as a general rivalled that of any other in Europe ... for his military character epitomized the art of war of his time.... Strategic caution and *logistic accuracy*, combined with *brilliant dash in small combats* and constancy under all circumstances – of success or failure – perhaps emerge as the salient points of Turenne’s genius for war. Great battles he avoided. ‘Few sieges and many combats’ he used as his own maxim. And, unlike his great rival Condé, who appeared as brilliant in his first battle as in his last, Turenne improved day by day. Napoleon said of him that, his genius grew bolder as it grew older.... In his personal character Turenne showed little more than the nature of a simple and honourable soldier, endowed with much tact... Thus, though Condé’s genius appeared far more versatile, Turenne’s genius best represents the art of war in the 17<sup>th</sup> century. For *the small, costly, and highly trained regular armies*, and for the dynastic warfare of the age of Louis XIV, Turenne functioned as the ideal army leader.” – from Wikipedia article, “Henri de La Tour d’Auvergne, Viscount of Turenne,” October 2, 2018 (emphasis added). Logistic accuracy is vitally important in GGDM operations, ships are expensive.

- ✓ “There was nothing spectacular about such methods as compared to the bloody onslaughts of the past decade. Where other generals strove to duplicate the victories, Turenne had studied in detail the troop movements of Maurice and Gustavus. Avoiding encounters unless he possessed an overwhelming advantage, he relied upon caution, surprise and logistic precision to manoeuvre the enemy into wasted territory while retaining his own sources of supply... He was, in short, a painstaking master of small war; and in 1648 his strategy brought the struggle to a close with an almost bloodless triumph of manoeuvre.” – Lynn Montross, *War Through the Ages* (3<sup>rd</sup> Ed., 1960), p. 292.

- Note, Maurice of Nassau was Turenne’s uncle to which he was apprenticed as an *aid-de-camp* in 1626, rising from private to colonel in five years on merit alone (*Id.*, p. 291). Sort of like a ‘coaching tree’ in modern sports.

- ✓ Losing a conflict due to maneuver (e.g., see also discussion of the Battle of Angora, 1402 A.D., 3 Carriers & Fighters, EN 4, p. 1076, *infra*) is like losing a game of Mahjongg due to the set up – you have lost the game before you play off the first pair of tiles and there is nothing you can do or could have done! Most infuriating are the games where, in order to make any progress, you must play off a pair of tile X, only to find later that the other pair of tile X is at the bottom stacked on top of each other – and you lose due to something you could not have possibly seen in advance. Yeah, it’s like that.

<sup>12</sup> Commentary: Granted that the Treasurer’s job is a thankless job in most times and places, especially in a foreign-occupied kingdom. But it was the road that Sir Hugh chose to personal power, as the King’s financial enforcer, and he seems to have been arrogant about it and also inhumane toward the Scots.

- ✓ The fact that he was a knight (back when knights were knights), that is, a soldier, and *de facto* co-commander of the English forces (and the Earl of Surrey wasn’t a strong personality), while also being the King’s Treasurer demonstrates the perils of the failure of Unity of Command (Clausewitz) and of the blurring of military and civil office (see The Fog of Lützen discussion, 4 Colleges, p. 510, *supra*). In addition, Hugh had also been involved in law enforcement as the Bailiff of Haverford, was a King’s Justice in the northern counties, and had held clerical administrative positions as rectors and was receiving clergyman stipends (*prebends*) from several churches. The Church stipends would have come from the donations and tithes collected from the poor masses, and it is not certain for what services he was being paid the stipends – to modern sensibilities, this seems like appalling entitlement and corruption.

<sup>13</sup> Commentary: Author Tom Godwin should not be confused with the originator of Godwin’s Law, attorney and author Mike Godwin.

<sup>14</sup> Commentary: About 1988 or 1989, I heard about a space-opera empire-building video game (I had an Atari 1040 ST at the time) which was logistics heavy; that before each military campaign, it was important to spend years/turns storing supplies, setting up the political and propaganda side, and moving stuff into position at frontier colonies. I do not now remember the name of the game and I never played it, but I am sure it was not Sun Dog, or Captain Blood, two other games I heard about at the time but also never played (we played lots of Colonial Conquest, Lords of Conquest, and Time Bandit on Atari STs). Nonetheless, the concept stuck in my mind and I believe it influenced my design project as did the following memory: I also recall hearing of another game around that time, which again, I never played and cannot recall the title, where the larger an empire gets the more it loses to corruption, thus slowing the growth of interstellar empires. Maybe they were the same game? I like concepts, ideas.

- ✓ In historical reality, the same occurred before the Ottoman Turks attempted to capture Vienna in 1683 A.D.: They spent a decade building up supplies, troops and cannons on the frontier before moving. Because of the experience of the previous siege of Vienna in 1529 A.D., the Ottoman commander bypassed fortresses and cities to reach Vienna in mid-July 1683 A.D. – the previous attempt in 1529 A.D. failed mainly because the Ottoman army didn’t arrive at Vienna until very late September and was able to maintain the siege for only two weeks. This may have been the inspiration behind the game mentioned above.

<sup>15</sup> Commentary: I think I read *Life, The Universe and Everything* (1982) when I was young (in the late 1980s) but I don’t seem to remember this. Maybe I only read part of it. Whatever I read didn’t leave an impression.

<sup>16</sup> Commentary: Conversely, creatures evolved in a galaxy located in a super void would also possibly not be aware of other galaxies beyond their own due to the fact it takes light up to a billion years to reach across a super void area. Science-fiction also avoids voids and super voids, though some have noted small local ‘rifts’ and ‘empty expanses.’

*“Ordinarily, calling a lift is a Simple task, but in the heat of battle, it tends to be more difficult. The referee should roll this task for the character, with the time duration of the task representing the combat round in which the lift arrives at that level. Once the lift arrives, the door will open, and the characters may enter the lift during the next combat round. If no character enters the lift, after two combat rounds the doors close, and the lift goes to a different level.”*

– MegaTraveller RPG Player’s Manual (1987)

**Combat Resupply:** Moviemakers love elevator fight scenes, e.g., Total Recall, Captain America, The Matrix, Die Hard. Log Ships are the only ships capable of, and the only means to, resupply ships in combat by transferring Fighters and/or Ship Missiles, or replacements for whatever else has been expended during the combat (i.e. other Expendable Enhancements).

- ✓ Log Ships that execute Combat Resupply must join the combat (Victuals & Vitals, 3 Combat, p. 975, *supra*). This should *not be confused* with supply on Regular Turns.
  - ✓ During combat resupply, the target unit and the Log Ship may not do anything else for the Combat Round, including attempting a retreat. Usually, the target unit and the Log Ship are Combat Screened (see 3 Fighters & Carriers, *infra*); it is not required. The unit(s) performing the Combat Screen cannot be the target of the resupply.
  - ✓ If the Log Ship or the target unit are successfully attacked (including Engaged results, see Engaged, 2 Carriers & Fighters, p. 1055, *infra*) during the Combat Round, the resupply aborts. The supplies are not lost (unless the Log Ship is destroyed), but the Log Ship is unable to resupply the target unit due to enemy interference. Combat resupply occurs after all attacks have been resolved in the round.
  - ✓ A Log Ship may resupply any number of other units in a Combat Round, until its replacements are exhausted. A unit receiving a transfer from a Log Ship must be able to legally use or carry what is received or the transfer does not happen.
- Great Hsi-Ku Arsenal: Colonies may not resupply units *during Combat Rounds* (including Orbital and System Defense Bases), and units in combat may not transfer supplies and enhancements between themselves, excepting Fighters from a destroyed Carrier.
- ✓ On the Regular Turn, the Log Ship could be refilled with whatever it can carry in the midst of Combat – because Combat Rounds run independent of Regular Turns (see Relativity, 2 The Streams of Time, p. 85, *supra*) – from a supporting colony in the same system by activation of the Construction Power for the purpose of Ship Supply. Again, timing is the key, as the Log Ship can Combat Resupply other ships if necessary during the Combat Round before the Regular Turn is run, so it may have extra capacity during processing of the Construction Power Activation.

The rule regarding Combat Resupply from a colony is a gray area, on the assumption that either the colony is trying to resupply Defense Bases during an attack on the colony or that the colony is too far away to resupply ships involved in a wide-ranging system-space combat. That said, it is probably possible for colonies to resupply whatever they have to Ground Bases, their Fighter Complements, and Ground Units during Combat Rounds. Mainly, this resupply is accomplished by building new stuff on the Colony during the Regular Turn actions.

- ✓ “Unexpectedly they then happened upon the Great Xigu Arsenal, a hidden Qing munitions cache of which the Allied Powers had had no knowledge until then. They immediately captured and occupied it, discovering not only Krupp field guns, but rifles with millions of rounds of ammunition, along with millions of pounds of rice and ample medical supplies. There they dug in and awaited rescue. A Chinese servant was able to infiltrate through the Boxer and Qing lines, informing the Eight Powers of the Seymour troops’ predicament. Surrounded and attacked nearly around the clock by Qing troops and Boxers, they were at the point of being overrun.” – from Wikipedia article, “Boxer Rebellion,” captured September 7, 2019.
- **Blitzkrieg:** People talk about the wrong thing when they talk about German Blitzkrieg. Blitzkrieg is at heart a new combat supply system addressing the shortcomings of WWI industrial warfare. In 1940 the French were still relying on WWI railhead supply and mobilization speed. During the campaign, the Germans also executed better than the French and had better command and control – but that goes hand in hand with the superior combat supply system called Blitzkrieg. Thus, it did not matter if the French tanks were equal in quality to German tanks; the Germans had more tanks and used them better because they had a better combat supply system and mindset. So, to blame the French Generals is to blame the entire French system for failure to innovate; for reliance on the systems of 20 years earlier.

---

*“And the Rebellion exposed something that perhaps nothing else could have exposed: The Imperial social contract was dead. That contract was the contract of empire. Eleven thousand worlds collected into one group need a set of values that they all share to remain together... When enough nobles forgot that their positions were not guaranteed by invisible forces...the Imperium was doomed.... When the admirals of the Imperial Navy, nobles all, and entrusted with power enough to snuff out billions of lives committed their fleets to battle against other Imperial Fleets, they turned their backs on the proud service that gave meaning to their careers. They, better than any other humans, knew the appalling power of the Imperial fleets, knew the annihilation that would result if fleet were pitted against fleet. Only the Imperium, the Navy, and humanity would lose. But the admirals did not stand together and refuse to do battle against humanity itself. Noblesse n’oblige plus.”*

– Dave Nilsen, “When Empires Fall,” Challenge Magazine, Issue 64, September 1992 <sup>1</sup>

---

**Noblesse n’oblige plus:** Merriam-Webster online dictionary reported that look-ups of the words “Godspeed,” “scion,” and “Nobless oblige,” spiked in the days following the death of former President George H.W. Bush.

- ✓ “It is of course quite easy to lambast the WASP power elite, in their exclusivity and material wealth unshared. The sins of [sic] committed should not be overlooked and should be criticized roundly. Yet, this sells short the virtues of our bygone ruling class. Ross Douthat from the New York Times writes, ‘Those virtues included a spirit of noblesse oblige and personal austerity and piety that went beyond the thank-you notes and boat shoes and prep school chapel-going – a spirit that trained the most privileged children for service, not just success, that sent men like Bush into combat alongside the sons of farmers and mechanics in the same way that it sent missionaries and diplomats abroad in the service of their churches and their country.’ From Mark Zuckerberg to Cory Booker, to even Ted Cruz, our new power elite seems to have ignored this idea in their education. As the old adage goes, ‘with great power, comes

great responsibility.’ Governance is not easy.” – Jack Beyrer, “George Bush, Noblesse Oblige, and the Death of American Leadership,” *The Wake Forest Review*, December 6, 2018.

Conservationist arguments are largely *nobless oblige* arguments. So are arguments about global wealth disparity. And arguments against animal cruelty. Finding the audience largely deaf to classic *nobless oblige*, most arguments turn to the question of what we are bequeathing to our children? Assuming we care about what world our children will inherit, i.e. Generativity.

Page | 870

- ✓ Think about the concept of *nobless oblige* in the opposite: One can imagine a Dickens-like cartoonish ‘bad guy’ wealthy ruler saying “Pah! Nobless oblige is just an excuse for the poor people to expect handouts from the government and the rich.”
- **Oblige:** “Oblige” is a worldview of proper personal and societal relations that has faded; it is the personal obligation one has to those who provide for their safety, sustenance and wellbeing. It is inherent in humanity. The concept survives as artifacts in our language, e.g.:
  - ✓ “Thanks to you I’m much obliged, For such a pleasant stay.” – Led Zeppelin, “Ramble On” (1969).<sup>2</sup>

Oblige is reciprocal and the direct opposite of tyranny. It was also a wide-ranging convention, and thus the concept developed that rulers were obliged to those whom they ruled and who supported their privileged lifestyles. One might (and probably should) feel obliged to their civilization when it provides infrastructure, distribution networks, social safety nets, law and order, protection, and medical or emergency assistance, to name a few.

- ✓ Generally, people have thought through the ages that we should be obliged to our parents for conceiving, birthing and raising us. But that issue has been debatable...

Oblige also formed the boundaries within which one moved socially, assuming and receiving obligations. However, obligations also usually prevented people from moving spatially (that is, travelling, relocating), for example, family obligations, employment or apprenticeship obligations, supervisory obligations, even obligations to tend cattle and sheep, and that is I think one of the main reasons for the faded concept in a society currently obsessed with freedom to travel (e.g., car culture, jet setting).

- ✓ In 2012, a man went hiking in the mountains of Colorado with his faithful dog. The dog’s paws became bruised from the rocky terrain and she was unable to walk farther. The man put the dog in a sheltered place and returned to civilization. He did not go back and get the dog (or apparently intend to), but simply left her there. Somehow, it got out and the man was absolutely shamed by outrage on social media and in the news and received death threats; a group with a carry litter hiked into the mountains, found the dog still in the shelter, hungry and thirsty, and brought her back. The man was forced to give up the dog for adoption by one of the rescuers and pay the vet bill.
- ✓ *Nobless Oblige* was probably the reason for the Christian Rapture (and related similar beliefs): How could God end the world without responsibility (oblige) to his worshipers? Lacking oblige, the Abrahamic Judeo-Christian God is just another tyrant. Thus, the story was invented that at the end of the world, believers would be taken up and ‘saved.’ Notably, the story never says what will happen to the animals and the rest of creation; we are not concerned with anything but saving our own bacon.

*“There is a contract and a bargain made between the King and his people, and your oath is taken: and certainly, Sir, the bond is reciprocal; for as you are the liege lord, so they liege subjects ... This we know, the one tie, the one bond, is the bond of protection that is due from the sovereign; the other is the bond of subjection that is due from the subject.”*

– Judge Bradshaw in response to speech by Charles I before the Rump Parliament (1649) <sup>3</sup>

**Noblesse Oblige:** In an interstellar civilization setting, who holds the actual power? There are potentially two competing centers of power, the system and planetary governments who rule over the vast planet-based masses and industry, and the starship captains and crews, especially those with military power, who hold it all together. It is the natural tension of the setting.

- ✓ The Roman Empire (on which interstellar science-fiction settings are sometimes modeled or referenced) had a similar complex tension. The transition of the Roman Republic to the Roman Empire was a three-pronged affair: Rome was a large military state, the transition made military service a road to political power, and the Empire made Rome extremely wealthy, aggravating preexisting wealth disparity.

It is the job – the existential necessity – of the interstellar government to hold them together in a smooth functioning arrangement – for the interstellar government needs both in order to exist.

- ✓ That arrangement may require the application of force, with attendant consequences, if no other solution is available or if the government doesn't care about the consequences, is impatient, prejudiced, pressured, etc. The nail that sticks up the most gets hammered down the hardest. It's not pretty, but look at Hong Kong in 2019.

The balance of this power depends on many factors of various complexity, for example, external threats, whether ships have their own supply capabilities, fuel and maintenance requirements, whether planetary or system or some larger government controls access to the starship service, such as commissioning of officers, training and indoctrination of crew, control and programming of ship computer systems, political and cultural unity and trust, the operational qualities of Star-drive technology, the strength and loyalty of planetary defenses, politicization and factionalizing of the military, and perhaps, even the state of artificial intelligence in the civilization. Heady.

- ✓ “Member worlds of the Imperium agree to pay taxes and obey a few fundamental laws which the Imperium promulgates, known as the High Laws.... In return, the Imperium agrees to patrol the space between the worlds, to protect interstellar trade, to encourage travel and commerce, and to arbitrate diplomatic relations between worlds. Beyond this, individual worlds are left to their own devices so long as they acknowledge the power of the Imperium to rule the stars.” – Traveller RPG Wiki, “Third Imperium,” captured June 10, 2018.

- This is part of the “imperial social contract” alluded to in the feature quote above; it is the arrangement of interstellar civilizations in space-opera fiction.

Space-opera or interstellar colonization/exploration science-fiction trope have addressed these issues and the implications sporadically, though rarely, directly. For example, what happens when starship officers and crew positions become hereditary? Should the starship captains and crew be members of the government or granted titles of nobility? In most cases, science-fiction (esp. television science-fiction) stories tend to portray starship captains and crew as modern United States or British naval officers and crew: uniformed, disciplined, nationalist, patriotic,

technically competent, career devoted, and recruited from the general population, trained and serving in a military that is subordinate to the democratically-elected civilian government.

- ✓ However, as Amy Schafer pointed out in “The Warrior Caste” (Slate Magazine, August 2, 2017), volunteer military service in modern democratic Western nations is borne by the same families generation after generation, an inherited family business of sorts, a sort of ‘warrior caste’ is developing (see full quote, 1 Colleges, EN 5, pp. 469-470, *infra*). Thus, it is becoming a myth that, other than in times of draft conscription, *levée en masse*, the military is recruited from the general population.

To the extent that this is realistic in the interstellar setting, there are warning signs along the road. For example, the number of captains and crews who turned to piracy (becoming *hostis humani generis*) in the 17<sup>th</sup> and 18<sup>th</sup> centuries, or the mutinies that occurred in the navies responsible for holding together far flung colonial empires. Or the “boomer” submarine (SSB/SSBN) captains (the Cold War nightmare subject of Tom Clancy’s famous book, The Hunt for Red October) who hold frightening power at the turn of a couple of keys, and who are the closest approximation to the power of interstellar warship captains.

But participants in the game should not pre-assume any particular condition. What happens when the planetary or system government loses legitimacy with the local population and the population looks to the starship captains to save them? And when starship captains or crew revolt, who will be sent to take care of that problem? When an interstellar civilization loses a significant starships, loses control of the technology or ship routes, the Long Dark Night will follow.

- ✓ The key factors enabling world war – whether or not you consider the Seven Years War the first world war – were reliable oceangoing ships and navigation, and at least two powers with sufficient industry and population to carry global power projection. The same must be said of starships as the indispensable agents of power in an interstellar war. Even in the Stargate SG-1 Universe, starships of all sizes and uses still had an important role – though almost all of the ships featured in the universe were warships or troop transports (presumably, most cargo trade and tourism travelled via Stargate, as did nearly all of the exploration in the series).
- Boomer & Bang-Bang: A “boomer” is a *ballistic missile submarine (SSB)* armed with nuclear missiles which are also usually nuclear powered (e.g., SSBNs – Trident, Poseidon, Typhoon, Delta II class submarines).<sup>4</sup> Both NATO and the Warsaw Pact had boomers in the Cold War; they served is the vital third leg of the mutually assured destruction (MAD).
  - ✓ [Interview] “... and then when the Soviets tested their first bomb we already understood that we had an answer to that, if you believe that there’s such a thing as deterrence and certainly at some level, the fact that a country that’s your enemy has nuclear weapons would certainly deter you from deciding to attack them without a good deal of thought at least, and of course there never was a war between the United States and the Soviet Union probably for exactly that reason. Nevertheless, there was a great hurrying and scurrying in Washington among the politicians about ‘What are we going to do? What are we going to do?’ [making hand-wringing motions] and the calm answer from people like Schriber and Robert Oppenheimer and others was look, we’ve got a lot more atomic bombs than they do ... and we are turning them out at a good rate now...” – Richard Rhodes (author of The Making of the Atomic Bomb (1986)), The Half-Life of Genius: Physicist Raemer Schreiber (2018).

That is, even if a first strike destroyed all of the land (ICBMs) and air-based nuclear weapon delivery systems, the submarines – operating independently deep underwater – would survive and deliver the counterstrike (subject of the movie, *Crimson Tide* (1995), called the ‘last Cold War movie’). Very likely, enough nuclear weapons would survive the first strike that the counterstrike would destroy the original aggressor. The likely end result would be the end of human civilization and possibly the end of life on Earth (by way of nuclear winter).

- ✓ The Soviet ballistic missile sub in *Hunt for Red October* (1984) was a Typhoon. The understanding came about in the late Cold War as depicted in popular books and movies (military men knew it) that upon the carefully picked and groomed boomer captains had settled the ultimate weight of *nobless oblige* of human civilization.
- ✓ In 1942, the German navy began experimenting with mounting missiles on U-boats; they successfully mounted some small mortar-like warheads on an external rack and launched them both from the surface and underwater. They were unguided projectiles and never used in combat. Later, desperate fantasy turned to the idea of mounting the V-1 on U-boats and attacking New York City. This was quite challenging and that late in the war, didn’t make much progress; later, they had another plan to launch V-2s which were even more technically difficult, from tubes towed underwater behind a U-boat. They may have completed building one V-2 tube; in the meantime, the U.S. intelligence received several reports which they took seriously. As late as the final months of 1944, German U-boats were able to land agents in Maine. In April-May 1945, Operation Teardrop was conducted to protect New York City from possible U-boat missile attacks. Although five of eleven U-boats were sunk, none of them had missiles mounted or towed. However, by February 1947, the U.S. Navy had adapted a V-1 missile design and successfully launched it from two submarines.

*“Nothing travels faster than light, with the possible exception of bad news, which obeys its own laws.” – Douglas Adams*

---

**Speed of Bad News:** Bad news must be the reason for Quantum Entanglement. Given what is actually transmitted in Quantum Entanglement – something happened to your matey – it is not inconceivable. Eh? How fast is quantum entanglement? No one really knows. Most articles on the internet cite 10,000 times the speed of light, but:

- ✓ “When most people describe this interesting process, they’ll describe the information transfer as ‘instantaneous’ or ‘near-instantaneous.’ Several research teams have attempted to measure the actual speed seen in the transfer of information in entangled systems, but have failed in one way or another, usually resulting from flawed methodology dealing in quantum nonlocality. ... So what were their results? The team came back and said that quantum entanglement transfers information at around 3-trillion meters per second – or four orders of magnitude faster than light. This is a lower speed limit, meaning as we collect more precise data, you can expect that number to get larger. At the moment, our technology and methodologies aren’t sensitive enough to measure speeds at this scale.” – Joshua Filmer, “Chinese Physicists Measure Speed of Quantum Entanglement,” *Futurism.com*, March 21, 2013.

Four orders of magnitude faster than light is... you guessed it. Quantum entanglement would reach Pluto in .0005 hours (1.8 seconds) whereas light from the sun takes 5 hours.

*“It is impossible to travel faster than light, and certainly not desirable, as one’s hat keeps blowing off.”*

– Woody Allen, “The UFO Menace,” *The New Yorker*, June 13, 1977

## Endnotes.

<sup>1</sup> Citation & Commentary: “The simple man, whose best self, his noble self, is nearly all the time puzzled, dumb and helpless, has still the power to recognise the man in whom the noble self is powerful and articulate. To this man he must pledge himself. That is the only way. To act according to the spark of nobility we have in us, not according to our greediness and our cowardice, our hard selves. The hereditary aristocratic class has fallen into disuse. And democracy means the electing of tools to serve the fears and the material desires of the masses. *Noblesse n’oblige plus*. This is really the worst that can happen to mankind, when *Noblesse n’oblige plus*. Goodness and badness there is bound to be. But a spark of nobility redeems everything. This is our job, then, our uncommon sense: to recognise the spark of nobleness inside us, and let it make us. To recognise the spark of noblesse in one another, and add our sparks together, to a flame. And to recognise the men who have stars, not mere specks of nobility in their souls, and to choose these for leaders. We can choose for *noblesse* and we can choose for *basesse*. Nations are slowly strangling one another in ‘competition.’ The cancer of finance spreads throughout the body of mankind. Individuals are diseased with the same disease. To get money, and to spend money, nothing else remains. And with it goes all the strangling, and the bullying, and the degradation, the sense of humiliation and worthlessness of life, which is bitterest of all. There is nothing to be done, *en masse*. But every youth, every girl can make the great historical change inside himself and herself, to care supremely for nothing but the spark of noblesse that is in him and in her, and to follow only the leader who is a star of the new, natural Noblesse.” – D.H. Lawrence, Movements in European History (1921).

- ✓ D.H. Lawrence was and is a controversial, anti-democratic figure (it is amazing to think now that Movements in European History was a British junior school text book); this somewhat Platonic quote is offered at face value. Every man is a dichotomy, and D.H. Lawrence is Exhibit A.
- ✓ It is more important in this case to put him into historical context, D.H. Lawrence, T.E. Lawrence and Adolf Hitler were the same generation; Bertrand Russel, whom he corresponded with, who called him a proto-Fascist, was the prior generation, and Albert Camus and John Sartre were the generation after.
- ✓ WWII and the Cold War made D.H. Lawrence’s political arguments *unpalatable* (when de-cartelization of German industry and the spread of democracy acted as a bulwark against Communism), while his befuddled common man seems to foreshadow Camus’ absurdism, but the preceding quote is still an interesting entry in the subject of how best to govern humanity.

<sup>2</sup> Citation: “But how tomato and ‘ta-mato’ came to be pronounced differently is an interesting historical question because history, surprisingly, affects language. And in the history of language, a change that would have changed the pronunciation of ‘ta-mato’ to the word ‘tomato’ and virtually the whole English language stands out as a shining ex-ample of the intimate connection between historical events and the words that describe them.” – The History Guy, “The Great Vowel Shift,” YouTube, January 27, 2020.

<sup>3</sup> Citation: See full speech and response, Luther & Charles Excerpt, Government Titles, *supra*.

<sup>4</sup> Commentary & Citation: Curiously, when the term “boomer definition” is Googled, there is no reference to the name for a ballistic missile submarine. In fact, the Merriam-Webster online dictionary definition of “boomer” is rather absurd in this regard; it refers only to the term for Baby Boomers (who, coincidentally, were the generation most concerned with the “boomer” submarines). Instead, a search for “boomer submarine” brings up the Wikipedia article on ballistic missile submarines. I have known “boomer” as the name for a ballistic missile submarine since I was young, 35 years ago. It seems as though there is some *unconscious millennial effort to bury or erase Cold War terms and the Cold War zeitgeist*. Other terms have been changed by events; for example, “ground zero” does not mean to the current generation what it meant when Weird Al Yankovic sang “Christmas at Ground Zero” in 1986.

- ✓ In 1986 in Okinawa, Japan, a couple of Marines in my unit had t-shirts that read, “24 empty missile silos, 24 mushroom clouds. It’s Miller time.” The shirt had a picture of a boomer on the surface of the ocean and a mushroom cloud in the distant background. A formation was called and the Battery Commander addressed us about diplomatic sensitivity and ordered that those shirts not be worn ever again while in Japan.

# War of the Worlds

## By H.G. Wells, published in 1898

### Opening and Ending Narration

#### Opening Narration:

No one would have believed in the last years of the nineteenth century that this world was being watched keenly and closely by intelligences greater than man's and yet as mortal as his own; that as men busied themselves about their various concerns they were scrutinized and studied, perhaps almost as narrowly as a man with a microscope might scrutinise the transient creatures that swarm and multiply in a drop of water.

With infinite complacency men went to and fro over this globe about their little affairs, serene in their assurance of their empire over matter. It is possible that the infusoria under the microscope do the same. No one gave a thought to the older worlds of space as sources of human danger, or thought of them only to dismiss the idea of life upon them as impossible or improbable. It is curious to recall some of the mental habits of those departed days. At most terrestrial men fancied there might be other men upon Mars, perhaps inferior to themselves and ready to welcome a missionary enterprise. Yet across the gulf of space, minds that are to our minds as ours are to those of the beasts that perish, intellects vast and cool and unsympathetic, regarded this earth with envious eyes, and slowly and surely drew their plans against us. And early in the twentieth century came the great disillusionment.

#### Final Narration:

For so it had come about, as indeed I and many men might have foreseen had not terror and disaster blinded our minds. These germs of disease have taken toll of humanity since the beginning of things--taken toll of our pre-human ancestors since life began here. But by virtue of this natural selection of our kind we have developed resisting power; to no germs do we succumb without a struggle, and to many--those that cause putrefaction in dead matter, for instance--our living frames are altogether immune. But there are no bacteria in Mars, and directly these invaders arrived, directly they drank and fed, our microscopic allies began to work their overthrow. Already when I watched them they were irrevocably doomed, dying and rotting even as they went to and fro. It was inevitable. By the toll of a billion deaths man has bought his birthright of the earth, and it is his against all comers; it would still be his were the Martians ten times as mighty as they are. For neither do men live nor die in vain.

*“The biggest population shift in modern times has been the colonization of the New World by Europeans, and the subsequent destruction of Native Americans (American Indians).”*

– Jared Diamond, Summary of Guns, Germs, and Steel (2017) p. 9

**Circumambulation:** When Columbus (or the 10<sup>th</sup> Century Norse) discovered the New World,<sup>1</sup> it was the unfortunate meeting of separate prongs of humanity that had migrated out of Africa millions of years earlier, the closing of the circle that humanity had circumambulated through the Earth’s land masses. This poetic observation that I have not seen mentioned elsewhere, was probably the inspiration for Harry Harrison’s April 1964 Galaxy Magazine short story, “Final Encounter,” in which humanity has been migrating and exploring around the edge of the galaxy and meets on the other side of the galaxy, a seemingly alien species with different physiology, advanced technology, and unknown language and alphabet, only to discover that the ‘aliens’ were the evolved descendants of the other human civilization that left Earth and explored and colonized in the other direction around the edge of the galaxy, hundreds of centuries earlier.

As science-fiction literature is most always a reflection of Earth history (usually the bad kind), after a period of time (possibly centuries) the new extra-planetary, extra-solar colonies will develop, outgrow, and eventually throw off the political, military, and economic controls of Earth, which like the Old World in modern history, is worn out and consumed by its own internal bickering, while the new colonies have endless potential and a new start. This is the template for nearly all social science-fiction stories about space colonization.

- ✓ An interesting discussion I had at a game day recently was the fate of the Earth in various science-fiction universes and short stories. Frequently, Earth is either destroyed, or rendered uninhabitable by interstellar wars (e.g., Asimov’s Robots, Empire and Foundation series, The Matrix movies, the Aliens movies), or simply becomes a low population or almost abandoned backwater. Sometimes its location is even forgotten or it is considered mythical (e.g., Dune, Battlestar Galactica). Rarely the Earth fares out well enough (e.g., Star Trek) or survives but is much changed (e.g., Warhammer 40K).
- ✓ In Jerome Bixby’s The Man From Earth (2007), John, who claims to be 14,000 years old, described his prehistoric wanderings as he simply followed the Sun, and thus wandered through India, Nepal where he met Buddha, and ended up in Rome during the early Empire. This tale astutely reflects the Great Migration followed by migration to the New World and across the North American continent to the Pacific Ocean.

**A Hitchhiker’s Guide:** Expansion consists primarily of two groups of activities:

- 1) Searching and exploring new stars, planets and **alien colonies** (i.e. Exploration),
- 2) Loading, Transporting and Unloading or Landing colonist to either create new colonies or expand existing colonies (i.e. Colonization).

Thus, the Expansion Power must be activated for any of the six following purposes:

1. Looking (Exploration),
2. Scouting (Exploration),
3. Loading Population (Colonization),

4. Transporting Population (Colonization),
  5. Unloading Population (Colonization),
  6. Landing Population (Colonization).
- Exploration: Activation of the Expansion Power for the purpose of Looking requires one Act, and one Scene on the star that is being used for the Looking while activation of the Expansion Power for the purpose of Scouting requires one Act. One activation of the Expansion Power for the purpose of Scouting allows any number of Scout Ships to depart from one starsystem (no Scene required), whether or not controlled by the Scout Ship's owner, to any number of *unsupported* destination systems (i.e. no Supporting Colony).
- ✓ No checks are made for failure to obey Expansion Power Activations for the purpose of Looking or Scouting, that is, they will never fail to execute due to inactive Constructural Elements (see Power Off, 2 Constructural Elements, p. 193, *supra*).
  - ✓ Looking attempts may not receive the benefit of Enlightenment, but Scout Ships can if their Epistemological Constructural Element is active.

It is possibly not realistic or consistent with previous rules for Scouts to avoid checks for failure to obey the Expansion Power Activation for the purpose of Scouting, but they are curious explorers! It should be regarded as a game convenience concession. Perhaps we might assume that Scouts are drones, with no organic crews, perhaps they have crews who are the more adventurous type, or people trying to escape the bounds of their civilization?

Scout Ships do have Constructural Elements like any other ship, regardless of assumptions (above) which they receive from their origin colony at the time they are built (see Maiden Voyage, 3 Construction, p. 677, *supra*) and thus may receive the benefit of Enlightenment (where applicable) if their Epistemological Constructural Element is active (see Skool Tyme, 2 Constructural Elements, p. 190, *supra*).

Conversely, if the Scouts were *departing for* any destination system with a Supporting Colony, that would require activation of the Movement Power (see Engage! and UniSIM, 1 Movement, pp. 738-739, *supra*) costing a Scene, instead of the Expansion Power and a check to see if the Scout obeys the Power Activation using the rules in 1 Movement, *supra*. This contradicts the preceding – it may even be silly – but does not ‘break’ the game, so to speak.

- Colonization: Activation of the Expansion Power for the purpose of Loading Population requires one Act and one Scene on the *colony planet* from which the population is Loaded.
- ✓ Activation of the Expansion Power for the purpose of Transporting Population requires one Act and one Scene on the *star* of the destination starsystem to which the population is being transported. See also Canned Food, 3 Expansion, p. 913, *infra*.
    - The game mechanical difference between Movement and Transporting Population is the placement of the Scene and of course the Vital Power activated (which may be important, e.g., for Government Title Conflict Checks).
  - ✓ One activation of the Expansion Power for the purpose of Transporting Population may be used to initiate interstellar movement of any number of *Colony Ships* from any number of origin systems to the destination starsystem (the opposite of normal movement where the Scene is on the origin star, convergence instead of divergence).

- ✓ Finally, activation of the Expansion Power for the purpose of Landing or Unloading (these are two separate purposes, Landing and Unloading are not the same, see Opening the Can Of..., 3 Expansion, p. 914, *infra*, The Landing, 4 Expansion, p. 920, *infra*) requires one Act plus one Scene on the *star* where the Landing occurs or on the *colonized planet* where Unloading occurs.

*“The Jewish–Roman wars had a dramatic impact on the Jews, turning them from a major population in the Eastern Mediterranean into a scattered and persecuted minority. The Jewish-Roman wars are often cited as a disaster to Jewish society. The defeat of the Jewish revolts altered the Jewish population and enhanced the importance of Jewish diaspora, essentially moving the demographic center of Jews from Judea to Galilee and Babylon, with minor communities across the Mediterranean.*

*Although having a sort of autonomy in the Galilee until the 4<sup>th</sup> century and later a limited success in establishing the short-lived Sasanian Jewish autonomy in Jerusalem in 614-617 CE, Jewish dominance in parts of the Southern Levant was regained only in the mid-20<sup>th</sup> century, with the founding of the modern state of Israel in 1948 CE.”*

– from Wikipedia article, “Jewish-Roman Wars,” captured September 7, 2019

**Seeding Space:** Activation of the Expansion Power in GGDM is ultimately about seeding space, it is the “flowering schedule” of the species, “short-distance pollen dispersal” and “long-distance gene flow” (Gérard, Klein, et al. (2006) quote from 5 Taxation & Census, EN 21, p. 351, *supra*) to prevent extinction, in addition to all of the other benefits, such as resources, information, scientific discoveries. It is into the night, against the nightfall.

As indicated in Primal States, 6 Beginnings, p. 61, *supra*, the homeworld may be forgotten, lost, or become unavailable. Or the homeworld may become just another colony in which the original species is but a minority among billions of aliens, see Pilgrimage to Earth, 2 Order, p. 541, *supra*. The migration may be forced by external forces or natural disasters. There is much human history to draw from, much room in GGDM for creation of backstories during play that relate to or expound upon the reasons why the position’s Native Population Type left home.

And the stories that we tell, the events we remember, are not usually about good happenings. No one just goes out for a spacewalk in the sunlight or to see the stars. We go into space for political prestige, to install spy satellites, for business purposes. Why would we not expect that when the technology is available, people will not go into space to get away from the Earth, to make a profit, to hide from the law, to seek vengeance, to fight wars, to get free lands, to steal, to spy, to gain power over the masses still on the ground?

- ✓ “Well, I dreamed I saw the silver spaceships flyin,’ In the yellow haze of the sun, There were children cryin’ and colors flyin,’ All around the chosen ones, All in a dream, all in a dream the loadin’ had begun, We were flyin’ mother nature’s silver seed to a new home in the sun, Flyin’ mother nature’s silver seed to a new home.” – Neil Young, “After the Gold Rush” (1970).
- **Be Fruitful and Multiply:** As you can imagine, *from the anti-natalist point of view*, sperm and egg banks are just ridiculous conceit. Although the technology and techniques developed for them, and the technical experience they provided in preserving sperm and eggs of humans is possibly important to the long-term survival of our species (e.g., the seed ships

mentioned previously in Uranium on the Cranium, 3 Beginnings, p. 40 and Assumptions of Light, 1 Stardrive, p. 781, *supra*), the concept of a sperm bank or egg bank is just absurd. It requires the donor to think that somehow their reproduction is ultimately important, even if done anonymously and without sexual gratification, and this is before we even consider the Kantian Imperatives. If human children are ever born on another planet, someone (probably us) is responsible for putting them there without their consent and they may curse us for it; there is no denying this as on Earth. Like Snorri Thorfinnsson or Virginia Dare, there will be a first human not born on Earth, or born in Earth orbit, or not born in our solar system, a first human born on the Moon, or on an exoplanet – unless, of course, we discover humans already out there. And they will be just names in a book.

- ✓ E.g., The Amazon blurb for John R. Brophy’s novel God’s Ground (2017) notes that by raising her children in a zero-gravity environment, the main character may be condemning them to life in space.

Judging from the Genesis Mandate, a strong anti-natalist sentiment existed in ancient times.

- ✓ “And God blessed them, and God said unto them, *Be fruitful, and multiply*, and replenish the earth, and subdue it: and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth.” – Genesis 1:28 (KJV) (emphasis added).

In forty-years wandering the desert, children were born, lived their lives and died in the Sinai and Negev deserts, because their parents put them there. They could not go back to Egypt, their only way was forward to Canaan or into still more deserts. In the desert environment, anti-natalist thought (possibly an extension of slavery or servitude or despair of wandering the desert) struggled against the need for increased numbers of tribal warriors to attack Canaan. Thus, the Genesis Mandate.

- ✓ Throughout the two seasons of the Stargate Universe series, various human and human like alien groups are left, stranded, crashed, or abandoned on planets along the Ancient Ship Destiny’s path inadvertently ‘seeding’, e.g., seven were left on Eden.

---

*“Doesn’t take much to make some men happy. For me, I like a shave and a bath. Maybe get into town now and then. See a woman.”*

– Flint McCullough, *Wagon Train* (1957-1965)

\*\*\*

*“That’s all any man can ask of you, but you know so many times the best is just not good enough. When you think of all the people, 75 or a 100 of ‘em who are gonna die when the cholera hits your camp without you knowin’ it’s comin’.. and that Indian war party that comes down off the high hills, their screams splinter the night and their arrows set fire to it... you say, ‘Well, I did my best.’ That’s what you say to all those silent dead, ‘I did my best.’”*

– Maj. Seth Adams, *Wagon Train* (1957-1965)

---

**Wagon Train to the Stars:** There are three Existential Patents available to positions prior to the start of the game (see 1 Patents, p. 729, *supra*) that are directly related to and necessary for the Expansion Power: Scout Ships (which allows positions to build Scout Ships), Colony Transport Ships (“CTs,” which allows positions to build the basic Colony Ship of the game, the name is

self-explanatory), and Controlled Environment Technology (CET) – the classic domed cities of science-fiction lore – which is necessary to colonize Unpleasant and Hostile Class Planets (see *The Air that I Breathe*, 3 Taxation & Census, p. 315, *supra*).<sup>2</sup> It is strongly suggested that positions obtain these technologies before the game (are sometimes required to), or soon thereafter.

- ✓ There is no ability to move population in the 1<sup>st</sup> Era without a Colony Ship or Boat.

Venus, Mercury, the Moon and most other places in our Solar System would be Hostile or Uninhabitable Habitability Class, while Mars, the only place that even looks vaguely Earth-like, would be a very Unpleasant or Hostile place to live. CET does not change the relative Habitability Class of the planet, it is not terraforming technology.

- ✓ “Mars ain’t the kind of place to raise the kids, in fact it’s cold as hell.” – Elton John, “Rocket Man” (1972).

It may be possible to develop “Colony Transport System Boats” for in-system colonization or to be placed on Tender Starships. For Load and Unload Population purposes, Colony Transport System Boats act as regular Colony Transports. For the purpose of Transporting Population activities, the Tender Starship will act as a regular Colony Ship. Participants would need to determine if the Tender Starship can use it’s OSL to support the Colony Boats.

- ✓ As all sci-fi fans know, “wagon train to the stars” is how Gene Roddenberry sold the idea of Star Trek to blinkered network executives in the mid-1960s when television was dominated by weekly Westerns (e.g., *Gunsmoke*, *Bonanza*, *The Rifleman*). *Star Trek: The Next Generation* (1987-1994) was thus a major shift to a late Cold War outlook.
- Scouts Honor: Scout Ships (hereafter, “Scouts”) are the primary means of exploration in the game because they are small, self-sufficient *non-warships* that have two extra turns of Operational Flight and Supply Limitations (OFL/OSL) *with a Ship Systems Existential Patent* (see 3 Movement, pp. 855-856 *supra*), or two turns OFL/OSL without it. They are clearly the most economical ships in terms of cost and economy of action. Scouts are unarmed targets, can never be armed but they are slippery, they receive one Defensive Shift in Combat which helps them retreat safely. Scout casualty rate is high, which saves on pensions and health care costs as well. What’s not to like? Join the Imperial Interstellar Scout Service today!
  - ✓ “The Viking Lander is a superbly instrumented and designed machine; it extends human capabilities to other and alien landscapes. By some standards, it is about as smart as a grasshopper; by others, only as intelligent as a bacterium. There is nothing demeaning in these comparisons, it took nature hundreds of millions of years to evolve bacterium, and billions of years to make a grasshopper. With only a little experience in this sort of business, we are getting pretty good at it.” – Carl Sagan, *Cosmos*, Episode 5.
- Colony Cans: Any ship designed for the purpose of transporting large populations (i.e. population factors) over interstellar distances is called a “Colony Ship.” The 1<sup>st</sup> Era Colony Ship, the Colony Transport is the only early game ship that can move population.

Through the course of the game, it is probable that positions may develop next Era Colony Ships through PIT Patents (see *Physical Item Technologies*, 2 Patents, p. 739, *supra*), however, the transport of living populations (especially if they happen to be hostile or unwilling,

e.g., District 9 (2009), Alien Nation (1988)) is such a complex logistical task that it must be considered its own specialized technology. The purpose of a Colony Ship is generally incompatible with that of a Warship or Cargo Ship and thus, Colony Ship technologies should not be combined with any Warship or Cargo Ship functions.

- **Building Up:** Colony Ships and Scout Ships are built, as any other ship, by activation of the Construction Power (see Laying Keel, 3 Construction, p. 675, *supra*) for that purpose at any colony that is eligible to build ships, when the position has the proper Existential Patents. Colony Ships cost 10 RPs, and Scout Ships cost 8 RPs to construct. Unlike Colony Ships, however, Scout Ships *do not require* an Orbital Shipyard, but then cost 10 RPs.

- ✓ This *implies* that Scout Ships might, unlike most ships, be able to land on the surface of planets; Colony Transports also Land to found a colony, but never take off again.

CET technology is a COT Patent (Continuous Operational Technology Patent, see 2 Patents, p. 739, *supra*); once completed, it is automatically assumed to be in use whenever a colony is established on an Unpleasant or Hostile Class planet. CET is specific and unique to each Native Population Type and must develop independently.

Admittedly, this is not very realistic, but it is a concession to ease of play. It is a grey area as to whether CET can be used to Land conquered alien population on a planet unsuitable for their Native Population Type. But this is space opera trope...

---

*“Migration, a phenomenon often confused with war, now threatened a civilization too decadent to defend itself. The human waves which beat against the frontier were almost impersonal in their impact, like some mighty and restless force of nature. Behind them, lending tribal impulse to the movement, came more waves of land-hungry barbarians seeking a racial home”*

– Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 87

---

**Core Worlds:** In classic space-opera fiction, the historical effect described by Mr. Montross is invasion of decadent, wealthy, industrialized, urbanized, technological ‘core’ worlds by rebellious frontier star princes, admirals, pirates, or newly risen alien races who serve as the ‘barbarians’ of the setting. This is the subject of the card game, Core Worlds (2011), part of the post millennial trifecta of space-opera-themed card games with Race for the Galaxy (2007) and Eminent Domain (2011).

- ✓ **Most players** will tend to think of the game in terms of moves they made, decisions, Regular Turn Actions and Combat Orders issued, they will see the game from the player point of view. To make GGDM work as emergent storytelling, a shift from the godview is necessary; players should try to think of the game as if they were recounting the history of a starfaring people (e.g., the original BSG pilot is called “The Saga of a Star World” (1978)), the social and political conditions, zeitgeist, of a time past.

**The Great Drama:** Without doubt, the massive migration of human and animal populations across great distances is the single greatest drama of human history. Human examples include, the prehistoric migration of native tribes to North America and into Mesoamerica or from the Danube River Valley to Ancient Greece or from the Indus River valley through India or the Yellow River Valley south through China,<sup>3</sup> the movement of the “Sea Peoples” of Mediterranean

antiquity, the Greek and Phoenician colonization, the legendary flight of the Nez Perez and other Native American tribes to Canada, the forced migration of the other Native American Tribes to reservations (aka the “Trail of Tears”), the conjectured migration of the Huns from the Chinese border through the Goth kingdoms of western Russia to the borders of the Roman Empire followed later by Tartars, Mongols, and Ottomans, and so forth.

The human magnitude of it is nearly beyond comprehension.<sup>4</sup> While the populations of the game are represented as ‘factors,’ it is strongly suggested that participants take a moment to consider what is involved in uprooting and moving populations, not just armies or fleets. This is one reason why the Expansion Power requires more Scenes than other Powers. The essence of the Expansion Power is population shift.

- Huns on the Rostrum: In the year 406 A.D., the *Iranian* Alans tribe crossed the Rhine and migrated into Gaul of the late Roman Empire. They settled in Gaul and eventually came into possession of the ancient city of Orléans by the mid-5<sup>th</sup> Century. At Orléans, the Alans held off Attila the Hun long enough for the Romans to gather an allied army, they then participated in defeating Attila at the Battle of Châlons in 451 A.D. A branch of the Alans followed the Vandals into Iberia in 409 A.D. In Iberia, the Alans set up a kingdom stretching in an arc from the Mediterranean coast (Spain) to the Atlantic coast (Portugal). Less than two decades later, the Iberian Alan king was killed in battle with the Visigoths (their old foes from the Orléans area) where they were decisively defeated, and they then asked for protection under the Vandals. The Iberian branch of the Alans was absorbed into the Vandals and lost their *ethnic identity*, the leader of the Vandals took the title, “King of the Vandals and Alans.”

Most Iberian Alans crossed into North Africa with the Vandals in 429 A.D. The Alans who remained in the *original homeland* between the Caucasus Mountains and the Caspian Sea were driven into the mountains by successive invasions of other migrating tribes (incl. the Pontic Bulgars who lend their name to modern Bulgaria), remaining today in the Republics of Russia and Georgia, speaking Ossetian, a Northern Iranian dialect. Thus, the Alan migration began around modern Georgia about 375 A.D., through Russia, Ukraine, Poland, Germany, France, then to Spain, and finally into North Africa as far as modern Tunisia and Libya by 450 A.D., leaving traces of their yDNA Haplogroup G2 in populations along the wide arc of their migration. The physical appearance (in some sense, ‘racial appearance’) of modern Ossetians in early 20<sup>th</sup> Century photographs that I saw is markedly different from the contemporary Roman description of the physical appearance of the Alans in Gaul.

- ✓ Information extracted from Wikipedia articles, “Alans,” and “Orleans,” September 30, 2018.

So the Alans and the Huns had a long term thing going on... the Alans Kingdom was the first destroyed by the Huns around 372-374 A.D. on the Pontic Steppes and the resistance of the Alans at Orléans – invited into the region by the Romans around 408 A.D. to fight the rebellious Visigoths – contributed to the defeat of Attila the Hun at the Battle of Châlons in 451 A.D. The Alans weren’t friends with the Romans either and were probably present at the Battle of Adrianople in 378 A.D., but by that time, the Roman’s didn’t have many friends.

- ✓ “We of course have to mention as well the Huns who moved into Europe around the 4<sup>th</sup> Century A.D. and the Mongols who moved into Eastern Europe and the Near East in the Middle Ages. Neither of these groups were Chinese. Historians aren’t 100% sure where the Huns came from, likely Central Asia, but possibly farther east, and the

Mongols came of course, from the north of China and modern-day Mongolia. However, focusing on the larger picture of Western and Eastern contact, both groups were affected by and affected the larger politics of the day in both empires, especially the Mongols. The Hunnic invasions of Europe were possibly influenced by migrations that began by being pushed west by China and likely heavily influenced the future dramatic barbarian migrations that led to the fall of the Western Roman Empire. But ironically, the Mongols who conquered China, likely played a role in prolonging the time of the Roman Empire known to Westerners as the Byzantine Empire by invading their rivals. Exploring the relations between these ancient civilizations gives us a very important insight into what the perspectives and lives of past peoples were like; an important insight as to how human civilization as a whole developed. It was a time when the world was nowhere near as connected as it is today, but not as far apart as we might have assumed.” – Justin [Narrator], “Did Rome and China Know Each Other?” YouTube video by Fire of Learning (<https://www.patreon.com/FireofLearning>), posted February 22, 2019.

The sublime epic of the Hunnic displacement from the northern borders of China (mentioned previously in 2 Disruption, 3 Entropy, and 4 The Streams of Time, *supra*) was well established by the mid-1980s. R. Ernest Dupuy and Trevor N. Dupuy, The Encyclopedia of Military History, 2<sup>nd</sup> Rev. Ed. (1986) note the following:

- ✓ “After defeating the Hsiung-nu (later known to Europe as the Huns), Shih Huang Ti built the Great Wall along the northern border of his domains as a barrier to prevent further nomadic inroads.” *Id.* at p. 79.
- ✓ “A punitive expedition against the Hsiung-nu was led by Tou Shien ... who overwhelmed the nomads and drove most of them westward. It was the final Chinese victory ... which apparently set into motion the great Hun migration which swept into Europe a few centuries later. Replacing those Hsiung-nu who had departed ... the Mongol tribe of Hsien Pi moved into the desert-mountain region and northwest of Kansu. In a few years (by 101) the Hsien Pi were raiding Chinese frontiers just as their predecessors had done.” *Id.* at pp. 132-133.

The Huns arrival in Europe (about 372-374 A.D.) resulted in a domino effect that sent the Goths and Alans streaming into the weakened and confused late Roman Empire:

- ✓ “The Hsiung-nu tribes driven from Mongolia by the Chinese 2 centuries earlier ... were apparently the ancestors of a fierce Mongoloid people – the Huns – who now entered European history. They invaded the lands of the Scythian-Germanic Alans ... in the region between the Volga and the Don. The Huns won a great victory at the Battle of the Tanais River...; in less than two years the kingdom of the Alans was overwhelmed. Some of the survivors were absorbed by the Huns; other refugees wandered through the lands of the Goths, and some reached the Roman Empire where they joined the imperial cavalry.” *Id.* at p. 155.
- ✓ “While vainly attempting to repulse a major Hunnish invasion, the ancient [King] Ermanaric was killed, or committed suicide. His successor, [King] Withimer, was soon after this also defeated and killed. The Ostrogoths – men, women, and children ... began to steam across the Dniester, seeking refuge from the Huns. [King] Athanaric,

leader of the Visigoths, planned to stand and fight the invaders, but most of his people, infected by the panic of their Ostrogothic cousins, also began to migrate *en masse* toward the Danube.... There were between 700,000 and 1,000,000 refugees, of whom more than 200,000 were warriors. Athanaric and the remainder of his people then sought refuge in the Carpathian and Transylvanian forests.” *Id.* at p. 156.

- ✓ “The panic-stricken Visigoths appealed to [Emperor] Valens to grant them refuge and protection. Valens reluctantly agreed, on condition that the warriors give up their arms, and that all male children under military age be surrendered as hostages. The frantic Goths agreed to the terms and began to cross the Danube. Most of the boys were surrendered and scattered through Asia Minor, but the Visigoths were slower to give up their weapons, bribing venal Roman officers with gold and other treasures, including the favors of their wives and daughters. Meanwhile, the remnants of the Ostrogoths reached the Danube, and appealed for refuge in the empire. When this was refused, they crossed the river anyway, since the Romans were too busy trying to look after the Visigoths – and their women – to pay much attention...” *Id.* p. 156.
- Roman Parley: Imagine for a moment having to give up your underage son or brother to the Romans to be able to cross the Danube River and settle in Pannonia.<sup>5</sup> Sophie’s choice?
  - ✓ “Roman officials in Thrace, not knowing what to do with the great influx of barbarians, took advantage of every opportunity to exploit and mistreat them. Fritigern and Alavius apparently tried to cooperate with their presumed protectors, but soon lost patience and began to negotiate with the Ostrogoths to present a united front against the Romans. At about this time, the Romans treacherously attacked the Visigothic leaders at a parley...” *Id.* at p. 156.

This was apparently a normal late Roman move, as Dupuy & Dupuy notes (*Id.* at p. 155) that Gabinus, King of the Quadi (a Teutonic tribe) – not to be confused with the earlier St. Gabinus – was killed by a Roman general during peace negotiations in 374 A.D. which caused the enraged Quadi to invade Pannonia and lay waste to it. It was also how the Ostrogoth leader killed Odoacer at the end of the Western Roman Empire, so the ‘barbarians’ learned well.

- ✓ I have heard arguments that the early Romans – the Republican Romans in the Punic Wars – were willing to risk it all to win big, they took chances that other conservative states would not have considered, and they overall won big. Chance-taking remained a Roman ‘virtue’ to the end, but the difference by the 4<sup>th</sup> Century A.D. was that the situation was both much more complicated and deteriorating, and that the late Roman leadership was not as ‘sharp’ as their Republican predecessors, and the chances they took in the mid-4<sup>th</sup> Century often were disastrously unsuccessful.

The core cause of the decline and decadence of the Roman Empire is the story of the warping and disregard of the answers to Why Not questions into sheer capriciousness, as illustrated by the insanity of the reigns of Emperors Nero (54-68 A.D.) and Commodus (177-192 A.D.). These two are only historical stand-outs, the overall trend of the empire made it difficult to maintain sensible answers to the Why Not questions when the Emperor had absolute power, was the worship object of the Imperial Cult, and was surrounded by immense wealth, with few or no effective reality checks. The loss of Roman virtue was the failure to answer the Why Not questions each generation as internal wars, assassinations, and bribery of the Praetorian Guard determined who would be the next Emperor.

- ✓ Although it is noted in many places that Mike Resnick never really explains why the human empire fell in Birthright: The Book of Man (1982) e.g.:
  - “Then, after there is no more room for conquest, the only way left is down: internal struggles as well as deep-seated resentment of aliens result in a decline of human power that takes nearly as long as the rise, but is described far less extensively. Somehow, despite whatever enabled humans to achieve total power, they were unable to keep it.” – Wikipedia article, “Birthright: The Book of Man,” May 15, 2019.

– it is clear that his overall historical model is the decline of the Roman Empire. And thus, the pattern may be the same, the situation was both much more complex after humanity had conquered all of the alien races of the galaxy, and human leadership took gambles that led to disaster.

- Valens & Alans: The search for *ultimate causes* in the “natural experiments” of history (see Jared Diamond, *et al*, *Unsolved Problems*, 3 Constructural Elements, pp. 209-210, *supra*) is really a search for *ultimate dynamics*. Industrial human population explosion and immigration led to the impetus, as described by Joel Shurkin in 3 *Taxation & Census*, pp. 314, 323, *supra*, for the development of electronic computers, starting with selling electric adding machines to the U.S. Census Bureau. Could we have predicted it? Did Malthus see it coming? In *hindsight* we think we or he might have...

The example of the Goths on the Danube in 376 A.D. is precisely a historical example behind the rules for Unloading and Loading population (and forced Balkanization) in GGDM, e.g., *Forced Balkanization*, 2 *Disruption*, p. 273, *supra*, and 3 and 4 *Expansion*, *infra*, which the Concierge could consider in *Interventions* and *disruption effects*.<sup>6</sup>

- ✓ “Either by coincidence or – more likely – some sort of informal alliance among the Germanic tribes, the entire European border of the empire now erupted from the mouth of the Rhine to the lower Danube.” *Id.*, Dupuy & Dupuy at p. 156.<sup>7</sup>
- ✓ “Yet it is evident on the eve of Adrianople that the Goths had no intimation of a victory that was to send the Empire tottering to its ruin. They had been literally pushed across the Danube by the pressure of migrating hordes behind them, only to be hemmed in by the Romans who had imprudently offered them refuge. Preservation must have seemed their only hope.” – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 88.

The Battle of Adrianople, where Roman Emperor Valens was killed by the Goths and Alans in a devastating Roman defeat, occurred in August 378 A.D. in Thrace, no more than six years after the Huns attacked the Kingdom of the Alans in the Pontic Steppes (Russia), between the Volga and the Don Rivers.<sup>8</sup>

Meanwhile, the Huns kept migrating, attacking the Eastern Roman Empire and the Persians (Sasanian Empire) in 395 A.D., attacked the Eastern Romans again in the 440s for failure to pay annual tribute to the Huns, and eventually invaded Gaul in 451 A.D. and Northern Italy in 452 A.D. in Attila’s bid to marry Honoria, the sister of the Roman Emperor.

- They Kept Coming: Westward mass migrations to Europe did not end with the Goths, Alans, and the fall of the Western Roman Empire. Later came the Bulgars, Avars, Magyars, Lombards, and others who beat against the borders of the Byzantine Empire and the Frankish

Kingdoms (Franks and Saxons were in Europe in the 4<sup>th</sup> Century A.D.), invaded northern Italy and southern England and eventually either ‘vanished’ as an ethnic group or tribe (like the Avars of the Pannonian Basin, between 790 and 870 A.D.) or became Christianized and settled down (the Magyars in Hungary accepted Christianity around 1000 A.D., the Avars were Christianized earlier, but their lands and populations were divided and shifted between princes into dissolution of their identity) to become the ancestors of modern nations. The Mongols arrived in the 13<sup>th</sup> Century near the tail end, and to great European relief, they abruptly abandoned European invasion and retreated from Hungary in 1242 A.D.

The last premodern major arrival in Europe were the Romi (known also as ‘Gypsies’), a dark-skinned people speaking an unknown language, wanderers in covered wagons moving in large groups, who arrived and migrated through central and western Europe between the mid-14<sup>th</sup> Century and the 16<sup>th</sup> Century. This group had left northwestern India (confirmed by genetics and linguistic analysis) around 500 A.D. (at the end of the Western Roman Empire) but arrived in Europe much later than other mass migrations; they arrived into a settled (relatively speaking) Europe a century after the Mongol terror subsided. The disparate poor treatment of Romi populations in Europe is well-documented history.

- ✓ “‘In the Judeo-Christian tradition, the history of salvation is essentially a history of migration,’ said the pontiff.” – Washington Post, January 9, 2018, from a speech given by the Pope in Regis Hall on January 8, 2018.
  - Apparently, there might be a view of history that the Great Migration was a process of ‘barbarians’ coming to be Christianized in Europe. That is, of course, literally what happened, by about 900 A.D. or just after, but were they saved? Really? Teleological thinking?
  - See also Core of Christianity, 1 Kairotic Moments, p. 1423, *infra*.

---

*“Whether we like it or not, bacteria are going to be our partners as we venture out into space. It’s imperative, therefore, that we learn as much about these microorganisms as possible in the event an astronaut develops a life-threatening infection, or to prevent problematic ‘biofilm’ formation inside the ISS and other spacecraft (such as a ship en-route to Mars). As previous studies have shown, bacteria behave differently in space, in some cases acquiring mutations that make them better at reproduction and more resilient to the effects of antibiotics”*

– George Dvorsky, “Alarming Study Indicates Why Certain Bacteria Are More Resistant to Drugs in Space,” Gizmodo, September 13, 2017

---

*“If we’re going to look for life on Mars, it would be really kind of lame to bring Earth life and find that instead.”*

– Catharine “Cassie” Conley, 7<sup>th</sup> NASA Planetary Protection Officer, NY Times Interview, 2015 <sup>9</sup>

---

**The Human Diaspora:** The human population on our Homeworld has exploded from approximately half a billion people at the end of the Middle Ages to seven billion people five hundred years later, despite devastating wars, famines, social unrest, and plagues (and bad habits). But

the amount of land area on Earth remains the same (for now, until the polar ice melts), with a significant portion of the available land being undesirable, uninhabitable, or in need of development to sustain significant populations, or at least, less desirable than other places. This drives both real estate prices and conflict: More population on the same amount or less land.

- ✓ Merriam-Webster online dictionary at *diaspora*: **2a**: people settled far from their ancestral homelands, **c**: the movement, migration, or scattering of a people away from an established or ancestral homeland. Diaspora is thus both a process (*Id.* **2:c**) and a condition/identity (*Id.* **2:a**), a merger spectrum of acquired meaning.

Global warming will shrink the amount of available land, displacing populations who lived on lost coastal lands – which coincidentally, happens to be where the world’s largest cities are located. At what point will significant numbers of people be willing to sell out and give up everything for a ticket “Through the Never” (Metallica, 1991) to elsewhere? Once the galaxy opens up with the invention of interstellar travel (by whatever means) real estate will be potentially unlimited, but some places will still be more desirable than others.

- ✓ The world population is estimated to have reached 1 billion in 1804, and 2 billion in 1927, and 7 billion in October 2011. Information from Wikipedia article, “World Population,” June 18, 2018. The world population of about 3.5 billion has doubled in the half century since I was born. Soylent Green anyone?

The logistical challenge and social disruption of massive population removal from the Home-world or colony should not be underestimated.

- ✓ “Reading between the lines, the abrupt about-face can be attributed to the stakeholders of contractors and government policymakers, who weren’t pleased with Wörner’s public fretting. *This speaks to space exploration’s tendency to become industrial policy, more about jobs than science*, which is a key reason why 1970s space visions of lunar bases and enormous space stations aren’t a reality.” – Tim Fernholz, “China and Europe Love SpaceX’s New Heavy Falcon Rocket. Does NASA?” Quartz, February 19, 2018 (emphasis added).<sup>10</sup>

Imagine the logistical and social challenges of removing just half the world’s current population – 3.5 billion persons – from the Earth into system space or a colony on Mars or to an interstellar colony location? How about even a million people?

- ✓ “But then there’s the Mars part. The 2033 target is nice, precise and buzzy, but for practical purposes it’s meaningless. Start with the things we need to build – in some cases invent – before we get to Mars. After the SLS and Orion are complete, we still need (deep breath): a habitat module for the outward-bound and return trips, radiation shielding, a landing module, a habitat for the surface, a pressurized rover, a greenhouse facility and a way to manufacture fuel, power and water onsite – infrastructure, in other words, when we can barely get the damn stuff built on Earth. Even SpaceX’s Elon Musk, whose pledge to have humans on Mars by 2024, beats Congress in the fever-dream category, was not impressed. ‘Perhaps there will be some future bill that makes a difference for Mars, but this is not it,’ he responded to a follower in an extended Twitter exchange about S.442.” – Jeffrey Kluger, “Magical Thinking Won’t Get You to Mars. (Washington Please Note),” Time.com, March 23, 2017.

- ✓ “If you want to go to the Moon, you design a system to put humans on the Moon. If you want to go to a different world, you design a system to put human beings on that world. If you want to go to deep space, you figure out what you need to go to deep space – and you go.... If you want to accomplish something great, you don’t look at the technology you’ve already developed and ask, ‘what can we do with it?’ Instead, you must look at the goal you want to achieve and ask, ‘what will it take to accomplish this?’ You also have to provide funding for it, and plan it on a realistically short timescale. If the goal is to go to Mars, we’ve already done extensive research into how much it would cost and what type of technological development it would require. To do it safely and responsibly, it would take a sustained investment totaling somewhere in the ballpark of \$50-\$150 billion, spread out over the course of approximately 10 years. The plan would involve landing a slew of equipment on the Martian surface, along with robots and rovers designed to self-assemble stations and habitats, and then a crew of human beings, who would stay for anywhere from 6 to 18 months before returning home. The largest and heaviest things ever landed on the Martian surface are far lighter than what a crewed mission would require, and the only way you ensure the safety of the crew on such an endeavor is through practice.” – Ethan Siegel, “Sorry America, We’re Not Going Back to the Moon,” *Forbes*, December 19, 2017.

Consider that it required centuries for European migration to North America to reach just a million.<sup>11</sup> The long line of ‘space-ark’ stories featured in science-fiction magazines (and popular as cover art), novels and movies (such as the classic *When Worlds Collide* (1951)) make it abundantly clear that only a select score, hundreds or thousands (the chosen ones) would be able to evacuate the planet. Such stories usually then go on to showcase the breakdown of law and order and reason on Earth in the face of animal survival instincts and desperation.

The real Diaspora begins when life on Earth is so unbearable for much of the population that the risk of space and colonization on other planets is preferable. That is, for those who can leave and if we can figure out how to leave. The remainder will be left behind. Global Triage?

- ✓ “Philip French’s review in *The Observer* suggested the premise was ‘intriguing B-feature apocalypse, determinism versus free will stuff’ and that the ending has something for everyone: ‘A chosen few will apparently be swept away by angels to a better place. If you’re a Christian fundamentalist who believes that Armageddon is nigh, you’ll have a family hug and wake up to be greeted by St Peter at the Pearly Gates. On the other hand, Darwinists will be gratified to see Gaia and her stellar opposite numbers sock it to an unconcerned mankind.’” – from Wikipedia article, “*Knowing (film)*,” captured September 15, 2019.
- **Frontiers:** Any colonized planet whose current population is significantly below the Maximum Habitability has a *frontier area* on the surface and corresponding urbanized, settled areas, probably the first landing areas and areas that had the easiest available resources. This concept can be useful in many parts of the game, such as Special Operations, local cultural milieu of planets, Interventions, and storytelling elements of the game.
  - ✓ “As the Planetary Protection Officer for NASA, I am responsible for ensuring that the United States complies with Article IX of The Outer Space Treaty. Article IX speci-

fies that planetary exploration should be carried out in a manner so as to avoid contamination of the bodies we are exploring throughout the solar system, and also to avoid any adverse effects to Earth if materials are brought back from outer space.” – Catharine “Cassie” Conley, 7<sup>th</sup> NASA Planetary Protection Officer.

- History in the Balance: Following the success of the American Revolution, the European powers – Spain, Britain, and to some extent, France, were very concerned about the Westward expansion potential of the new United States. The British made an alliance with Native American tribes to block expansion along the Ohio River and Great Lakes (e.g., the Northwest Indian War, 1785-1795), Spain and Britain both engaged in espionage (e.g., Burr Conspiracy, 1805). The Civil War provided a golden opportunity to split the new nation in two. They were right to be concerned as within 100 years the expanding wave of population, pushed by immigrants from Europe, had smashed through every barrier – natural, legal, moral, human, humane and moved vast distances – to settle all territories coast to coast.
- ✓ If England held the 13 Colonies, they are the world’s first superpower, if they lost the 13 Colonies, the new United States will eventually eclipse the European powers.
  - ✓ “The Union victory and Lincoln’s [Emancipation Proclamation] played a considerable role in dissuading the governments of France and Britain from recognizing the Confederacy; some suspected they were planning to do so in the aftermath of another Union defeat. When the issue of emancipation was linked to the progress of the war, neither government had the political will to oppose the United States, since it linked support of the Confederacy to support for slavery. Both countries had already abolished slavery, and the public would not have tolerated the government militarily supporting a sovereignty upholding the ideals of slavery.” – from Wikipedia article, “Battle of Antietam,” captured November 11, 2019.
  - ✓ Most 4X space games are built on this historical model and lacking a ‘coast’ or much discernible terrain in space, they substitute rifts, black holes, asteroids, dust clouds, and nebulae and game board edges for terrain; GGDM participants will find themselves in a similar situation except that there are no limits, no end line.

---

*“That coarseness and strength combined with acuteness and inquisitiveness; that practical, inventive turn of mind, quick to find expedients; that masterful grasp of material things, lacking in the artistic but powerful to effect great ends; that restless, nervous energy; that dominant individualism, working for good and evil, and withal that buoyancy and exuberance which comes with freedom – these are the traits of the frontier.”*

– Frederick Jackson Turner, [The Significance of the Frontier in American History \(1893\)](#)

## Endnotes.

---

<sup>1</sup> Commentary & Citation: There are no surviving contemporary portraits of Christopher Columbus, all pictures were created after his death by people who could not have or likely never met him. There is even a dispute about the location of his remains, which have been moved half a dozen times, kicked around half the globe like a geopolitical football. So, who knows, maybe he was a time-traveler from the future of humanity changing their history? Imagine what future are they trying to change? In light of what happened later, the charges of most brutal tyranny (to which even their supporters had to admit in Bobadilla’s report witness testimonials, discovered in 2006) against the brothers Columbus seem particularly unjust; others later were not held even close to the same standard.

<sup>2</sup> Commentary: CET, Habitability Class and Maximum Habitability, Landing, Colony Transports, and star colors are remainders from the original Stellar Conquest (1976) board game.

<sup>3</sup> Commentary: The ‘Cradles of Civilization,’ that we all learned in school were the early urban power centers, and their quest for resources and control led to expansion of civilization beyond the cradle.

<sup>4</sup> Commentary: I have, since my teenage years, had a sublime fascination with tracing the great migrations of humanity across the globe. There is something sublime about the distances, time intervals and numbers, across what is now called ‘flyover country,’ that arrive eventually at the modern polities, languages and cultures.

<sup>5</sup> Commentary: This is similar to a scene in a movie I watched about the Warsaw Resistance during WWII; civilians were being smuggled out of Warsaw wading knee deep through the sewers at night. A baby started crying. If they were discovered by the Germans, they would all be killed. The baby needed to be silenced immediately.

<sup>6</sup> Commentary: Dupuy & Dupuy seem to be suggesting that the arrival of the Goth and Alan refugees (up to 1,000,000 with 200,000 warriors, *Id.*) at the Danube was a great positive opportunity for the Roman Empire; I have read in other places that Pannonia, Dalmatia, and Moesia had been largely depopulated in the previous 50 years by raids, revolts, civil wars, famines, and plague and that the intent was for the Goths to settle into the depopulated areas. This is not an unreasonable idea and probably Valens’ intent, but clearly, the Romans were so far gone in corruption, incompetence, and exploitation that they blew it and turned a potential boon into a disaster at Adrianople.

- ✓ This is similar to an argument I heard in my youth about how the Nazi racial policies cost Germany up to half a million potential recruits for their armies, in addition to all of the efforts expended (and credibility lost) over their racial policies and wasteful exploitation, and of course, the intellectual flight to the West.

<sup>7</sup> Commentary: Noting that the Goths, Franks, Alans, Scythian (e.g., Sarmatians) and Teutonic (e.g., Quadi) tribes had all crossed the Rhine and Danube in the first decades of the fourth century A.D. several times raiding and attempting to migrate into the Roman Empire, only to be repulsed and driven back. So there was some history there between the Romans and the refugee tribes. The final mass crossing of the frozen Rhine in December 406 by tens of thousands of tribal warriors and families is considered a second major mark of the end of the Roman Empire after the defeat at Adrianople in 378 A.D. Within a century of Adrianople, the Western Roman Empire was but a shade.

<sup>8</sup> Commentary: Adrianople holds a truly special place in Western history, there are at least eight or nine different Battles or Sieges of Adrianople, each marking the rise or decline of an empire. The Bulgarians, Latins and Byzantines passed it back and forth, then the Ottomans took it from the Byzantines, the Russians took it from the Ottomans, and the Bulgarians took it from the Ottomans in 1913. Perhaps most important is the ambush and disastrous defeat of the nascent Latin Empire (established by the Fourth Crusade after the 1204 A.D. Sack of Constantinople) at Adrianople in April 1205 by the Second Bulgarian Empire and Cumans in which Emperor Baldwin I was captured. The Latin Empire collapsed after a half century of wobbly rule and crisis, the Byzantine Empire was restored.

<sup>9</sup> Citation & Commentary: “Actually, however, you can sound the all clear: The planetary protection job is real, though its purpose is only partly to save Earthlings from the ravages of alien life forms (and by life forms we mean microbes, not green guys). A bigger part of the job is to protect aliens from us – the real bad guys.... If an earthly organism got loose in an otherwise pristine place, two problematic things could happen: The contamination would make it impossible to know for sure if any organism you detected was native to the planet or a stowaway. Worse, if alien life did exist, Earth bugs could contaminate its environment and perhaps even prove to be lethal. In-bound contamination – the space-to-Earth variety – has, of course, always been what worries us more. When astronauts from the first three Apollo moon landings returned to Earth, they were kept in quarantine for three weeks to ensure that they had not picked up any lunar bugs. That was unlikely given that the moon is an airless, waterless, and thus likely sterile place. But in fact there was a bit of a scare.” – Jeffrey Kluger, “Why NASA Is Right to Hire a ‘Planetary Protection Officer,’” Time.com, August 2, 2017.

- ✓ Now, think of it, if the EU had installed a Native American Protection Officer in 1500 A.D., the entire course of history would be so much different.☺

*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*

*“Will this project give us an answer? This project promises new data with hopes to understand this system. This project will be highly rewarding if we catch the star when it dips. But the possibility remains that over the course of the observing campaign the star will do nothing exciting. So please keep in mind that ‘new data’ does not necessarily mean ‘results,’ whether in the immediate or distant future. But also keep in mind, if we don’t look, we will never know!”*

– Tabettha Boyajian, Ph.D., Kickstarter Project Page, June 16, 2016

**Why Does it Matter?:** And why does it matter if we know? Each of the 1,700 people who backed the project thought it mattered enough to give up money. Each of the people involved in the project thought it mattered, enough to give up time and effort, to make it a career-defining project. We often do such things on the intuition (or faith “that the dots will connect down the road” – Steve Jobs feature quote, 3 Patents p. 747, *supra*) that it matters or will matter, somewhere, somehow, someday, without being able to articulate.<sup>1</sup>

**The Looking Laws:** Our ancestors looked up into the night sky and saw stars.<sup>2</sup> Maybe what we call stars now (our concept is remarkably different), but to them, they were steady reliable lights spots in the night sky. Why did our ancestors look up into the night sky? Because, on Earth, matter falls from the sky, rain falls from the sky and makes us wet, and our crops grow, snow falls from the sky and it gets cold, clouds block out the sun and that is a warning. Our ancestors looked up to the sky because the sky mattered. They may well have looked up into the sky anyway out of curiosity, because curiosity matters too.

- ✓ “Half of science is convincing the world that what you are working on matters.” – “Medical Student” (actor) in Microsoft Commercial, April 2018.

*Matter* is that thing which forms the universe (Merriam-Webster **2a & 2b**<sup>3</sup>). *Matter* is also a subject under consideration, a subject of disagreement or litigation, the subject of a discourse or writing, something to be proved at law, something serious as opposed to nonsense or drollery, and reason and cause, and the problem or difficulty (*Id.* 1a-1i). There are no subjects under consideration, disagreements, discourses, writings, laws, seriousness or nonsense, or even reason or cause, or problems or difficulty, without life and intelligence (mortal or divine, it doesn’t matter) and someone to ‘look.’ So, it should be no surprise then that *matter* is “the indeterminate subject of reality, the element of the universe that undergoes formation and alteration” (*Id.* 3a) and most importantly, “the formless substratum of all things which exists only potentially and upon which form acts to produce realities” (*Id.* 3b).

Looking – not just seeing or hearing – is nearly synonymous with our concept of consciousness and is the base act of nearly everything we do – checking, monitoring, experimenting, observing, creating, building, caring, duties and responsibilities, rolling the die or drawing a card, safety,<sup>4</sup> working, progress, arguing, criticism, ethics, memories (why have memories if you are not looking at them?), judgment, planning, anticipation, hunting, scavenging, being a male or female. ‘Looking’ is the doing of being.

We ‘look’ because it matters and when it matters, and it matters only when we ‘look.’ Alternatively: We look when it *matters* and it *matters* when we look. I cannot make anyone look at GGDM or anything else, until it matters to them. Can a *silly space game* be macrosociology?

- ✓ “Self-referential statements are admissible in argument so long as they are non-contradictory.” – Gennady Stolyarov II, “Doubt the Action Axiom? Try to Disprove It,” Mises Institute, April 5, 2006 (available free online).

The Galactic Space playing area is unlimited and expands when necessary. Players will look outside the initial thirty-star cluster when necessary, when it matters. Whether or not the stars outside were there the entire time is irrelevant to the game, they are there when it matters.<sup>5</sup>

Page | 891

- ✓ And here we dance a light step around a probable violation of the Laws of Thought and keep GGDM in rational territory. But the empirical facts of quantum physics that cannot be wished away, seem most threatening to us when the indeterminate state (and generally the concept of fuzziness) appears to violate the Laws of Thought – the center of human rational discourse – laid down by Aristotle nearly 2,500 years ago.
- What Matters: Think of it this way: The only effective way to argue that something is wrong – whether it be ethics, sin, strategy, legal procedure, cockpit procedure, or manufacturing procedures – is to argue that it matters, it might matter, or there might be a foreseeable and probable circumstance where it matters. And this requires evidence, history, foresight, sapience, and abstract thinking. Even if you are sitting on your brain currently, you can understand what matters.

The milk bond is the first bond. The people who *matter* are those who have something or can take something we want or need, are able to make a decision to give, take or withhold, and have the ability and/or legitimate or illegitimate authority to act upon that decision. This includes criminals with guns, in-laws whose approval is deemed important to domestic tranquility, and employees or family members who perform skilled, indispensable functions in the business (for which there are in some cases, business insurance policies for ‘key persons’), people of enough political or social importance to be protected by the Secret Service, organization or family unit but otherwise would not *matter*.

This is not difficult to understand. Consider: The U.S. Marine Corps does not care one bit about what I think of it or say about it after I have been discharged. Any more so than any military cares about what millions of veterans individually say about their service (with some concession that they hate negative publicity in the form of books, movies, and testimonial accounts, but they cannot do anything about that, so it doesn’t really *matter*). However, if I were a politician who somehow became the Secretary of the Navy with budgetary control, or a prominent member of Congress whose vote on military budget matters was critical, then they would be concerned about my opinion.

---

*“Physical intuition starts developing early, long before we ever encounter Newton’s laws on a blackboard. ‘Babies have a few skeletal principles that are built in to the brain and help them reason about and predict how objects should act and interact in the world,’ says Kristy vanMarle, an infant cognition researcher at the University of Missouri. They understand, for instance, that objects can’t pass through each other, a notion that’s at odds with a quantum effect called tunneling, which allows objects to slip through barriers that, in the classic world, would be impenetrable....”*

---

*Babies also intuitively grasp that objects exist even when you're not looking at them, a concept called 'object permanence' that goes against the classic Copenhagen interpretation of quantum mechanics, in which an object can't be said to have any definite properties until the moment at which it is observed. Since Jean Piaget first pegged object permanence as a milestone in infant development, psychology researchers have found evidence that ever-younger babies have some sense of it; affirming object permanence seems to be the main theme of peek-a-boo."*

– Kate Becker, “Is Quantum Intuition Possible?” NOVA, July 28, 2014

**Ontological Schisms:** Peek-a-boo! Probably the first schism between the commonly perceived reality and the reality of subatomic physics came when science informed us that what we perceive as solid is mostly – nothingness, empty space. This subject usually comes up early in primary school science education, taught without implications, and generally forgotten shortly thereafter. This is not quite in the same category however, as quantum indeterminacy, as the fact that matter is composed mostly of nothingness does not challenge directly the objective existence of the universe (and the common perception thereof) – one can always shrug and say it must always have been so and we just didn't know we were mostly nothingness until science learned it. But the same can be said of quantum indeterminacy and isn't that somewhat strange? An emergent fractured-universe paradox at the core of 'reality' – that reality is both objective and indeterminate at the same time. It was there the whole time, waiting for our science to discover it.

- ✓ “One may remark here that uncertainty may simply be a mind phenomenon and not a feature of reality, that reality is in fact completely determined, or that science may eventually allow us to understand the determination of all events. [Ludwig von] Mises had no problem with that possibility and, in fact, may have been a determinist himself. By insisting on methodological dualism, however, he was simply pointing out that at present time, empirical science does not shed light on the topic one way or another and, for human scientists studying human behavior, the intentionality of human action seems to be a valid and constructive premise on which to build a social science.” – Michael Accad, M.D., “An introduction to praxeology and Austrian school economics,” alertandoriented.com (blog), April 13, 2016.

Praxeology and Schrödinger's cat? Have I just crossed the streams, is the universe going to implode? Well, it didn't happen in Ghost Busters (1984) (Egon: “Definitely, there's a very slim chance we will survive.”) so we are probably saved. It is historically notable that Austrian economics and quantum uncertainty developed in the same period and are thus part of a wider cognitive development of humanity.

- ✓ Blinding speed, especially of an object in our peripheral vision, challenges our intuitive concept of object permanence. It disappears in a 'flash' or perhaps like a bullet, we never see it in flight, only the beginning and end. Object permanence then becomes more and more of an abstraction, we wonder if it was ever there, or illusion.
- ✓ The third trailer for the 2016 horror movie, *The Witch*, shows a Puritan girl playing peek-a-boo with a giggling baby in a field. She covers her eyes – not his – and then pulls her hands away and says “Boo!” It is shown from the baby's perspective. On

the third round, she uncovered her eyes and the baby wasn't there. It was seemingly impossible for the baby to have vanished without a trace in those five or ten seconds, in the middle of an open field in daylight; she looked around frantically. In the sense expressed by Ms. Becker, quantum physics equates to old concepts of witchcraft: a violation of object permanence.

- See also Empirical Mythology discussion, 1 Technology, p. 691, *supra*.

*“Quantum physics defies our physical intuition about how the world is supposed to work. In the quantum world, objects resist such classical banalities as ‘position’ and ‘speed,’ particles are waves and waves are particles, and the act of observing seems to change the system being observed. But what if we could develop a ‘quantum intuition’ that would make this all seem as natural as an apple falling from a tree?”*

– Kate Becker, “Is Quantum Intuition Possible?” NOVA, July 28, 2014

**Peek-a-Boo:** I had a collie dog who used to hide his nose in the shower curtain when he got a bath. We used to laugh about it, I remember we thought that he thought that we couldn't see him if he hid his head in the shower curtain – despite the fact that he was getting a bath anyway and could feel the water. So ok, that didn't make any sense, but who knows? He might also have thought he was being punished (we did have to forcefully keep him in the tub and stop him from shaking water all over the place); the way a toddler fusses when an adult holds them still and wipes their face after they make a mess eating. It also might be like when someone looks away while they are getting vaccinated or having their blood drawn.

✓ “Schrödinger wrote:

‘One can even set up quite ridiculous cases. A cat is penned up in a steel chamber, along with the following device (which must be secured against direct interference by the cat): in a Geiger counter, there is a tiny bit of radioactive substance, so small, that perhaps in the course of the hour one of the atoms decays, but also, with equal probability, perhaps none; if it happens, the counter tube discharges and through a relay releases a hammer that shatters a small flask of hydrocyanic acid. If one has left this entire system to itself for an hour, one would say that the cat still lives if meanwhile no atom has decayed. The first atomic decay would have poisoned it. The psi-function of the entire system would express this by having in it the living and dead cat (pardon the expression) mixed or smeared out in equal parts.

It is typical of these cases that an indeterminacy originally restricted to the atomic domain becomes transformed into macroscopic indeterminacy, which can then be resolved by direct observation. That prevents us from so naively accepting as valid a ‘blurred model’ for representing reality. In itself, it would not embody anything unclear or contradictory. There is a difference between a shaky or out-of-focus photograph and a snapshot of clouds and fog banks.’

Schrödinger's famous thought experiment poses the question, ‘when does a quantum system stop existing as a superposition of states and become one or the other?’ (More

technically, when does the actual quantum state stop being a non-trivial linear combination of states, each of which resembles different classical states, and instead begin to have a unique classical description?) If the cat survives, it remembers only being alive. But explanations of the EPR [Einstein–Podolsky–Rosen paradox] experiments that are consistent with standard microscopic quantum mechanics require that macroscopic objects, such as cats and notebooks, do not always have unique classical descriptions. The thought experiment illustrates this apparent paradox. Our intuition says that no observer can be in a mixture of states – yet the cat, it seems from the thought experiment, can be such a mixture. Is the cat required to be an observer, or does its existence in a single well-defined classical state require another external observer?” – from Wikipedia article, “Schrödinger’s cat,” (quoting a translation of Schrödinger’s 1935 paper), captured May 27, 2019.

The cleverness of Schrödinger’s thought experiment is that he took subatomic uncertainty and blew it up into something in our world that is cognizable.

Schrödinger’s cat (the subject of endless geeky t-shirts) is at the center of the looking argument. The state of the cat is indeterminate to the outside observer at least – the state of anything is presumably indeterminate – until we look. But what does that mean? The genius of the experiment was to form a thought bridge from the indeterminacy of the quantum world to our everyday world. From this comes the notion that probabilities collapse into reality in the act of looking and this seems to be confirmed by the experiment with the two holes.

- ✓ “We can try cheating – shutting or opening one of the holes quickly while the electron is in transit through the apparatus. It doesn’t work – the pattern on the screen is always the ‘right’ one for the state of the holes at the instant the electron was passing through. We can try peeking to ‘see’ which hole the electron goes through. When the equivalent of this experiment is carried out, the result is even more bizarre. Imagine an arrangement that records which hole an electron goes through but lets it pass on its way to the detector screen. Now, the electrons behave like normal, self-respecting everyday particles. We always see now the pattern that builds up on the detector screen is exactly equivalent to the pattern for bullets, with no trace of interference.

The electrons not only know whether or not both holes are open, they know whether or not we are watching them and adjust their behavior accordingly. There is no clearer example of the interaction of the observer with the experiment. When we try to look at the spread out electron wave, it collapses into a definite particle, but when we are not looking, it keeps its options open. In terms of Born’s probabilities, the electron is being forced by our measurement to choose one course of action out of an array of possibilities. There is a certain probability that it could go through one hole, and an equivalent probability that it may go through the other; probability interference produces the diffraction pattern at our detector. When we detect an electron, though, it can only be in one place, and that changes the probability pattern for its future – for that electron, it is now certain which hole it went through. But unless someone looks, nature herself does not know which hole the electron is going through.” – John Gribbin, *In Search of Schrödinger’s Cat* (1984), p. 171.<sup>6</sup>

Scientist however, reject the idea that humans are the agents of local collapse of probabilities (“Analysis of an actual experiment found that measurement alone (for example by a Geiger counter) is sufficient to collapse a quantum wave function before there is any conscious observation of the measurement, although the validity of their design is disputed.” *Id.*), but have not offered a replacement explanation to my knowledge (there are many interpretations). It is also not clear what exactly ‘looking’ means or what is required, cognitively, of the looker (can the cat be looking?). But what most greatly troubles the Western consciousness – if the thought experiment is taken seriously – is the lack of any explanation or framework to reconcile the looking (“To appear is to be known” – Avi Sion; the *a priori* or axiom of phenomenology) – the individual, daily, moment to moment phenomenological experience – with the continuity, existence of the larger universe that humans have long thought existed objectively.<sup>7</sup>

- ✓ “No less an authority than Max Born, who received the 1954 Nobel Prize for his contributions to the foundation of quantum mechanics, felt that our minds just weren’t up to the task of ‘intuiting’ quantum physics. As he wrote in ‘Atomic Physics,’ first published in English in 1935, ‘The ultimate origin of the difficulty lies in the fact (or philosophical principle) that we are compelled to use the words of common language when we wish to describe a phenomenon, not by logical or mathematical analysis, but by a picture appealing to the imagination. Common language has grown by everyday experience and can never surpass these limits.’” – Kate Becker, “Is Quantum Intuition Possible?” NOVA, July 28, 2014.

GGDM is not going to offer an answer to those questions (we do not speak math), but instead approaches these issues in a couple of ways. The first is the Temporal Constructural Element (see 1 Constructural Elements, p. 173, *supra*), and the second are the Looking mechanics (*ut infra*).

- ✓ The most explicit sense in which ‘looking’ is true is the Public Space; things appear in the Public Space because we collectively look, see The Collective Consciousness, 1 Constructural Elements, p. 171, *supra*. Looking in that sense is the *flip side* of phenomenology: Looking – Appearing. Heads – Tails. Within GGDM play of course, stars that are *within the game* always appear on the Star Log (a record) and can appear on the Public Space if in actual contact with civilization. There are certain other parts of GGDM, e.g., Cultural Proficiency pieces, Government Titles and pathways, which only appear on the Public Space and are generally placed there (or are affected) when positions activate Powers (i.e. ‘look’).
- Neither Nor: Ultimately, whether the cat is dead or alive can be expressed as 0 or 1, but that value cannot be assigned until someone looks. So, in this sense, does the information exist independently of the observer (unless you believe in pre-destiny), as the Wikipedia quote maintains? If so, in what state, if it cannot be either 0 or 1? See, that is the problem?
  - ✓ “Information is the resolution of uncertainty; it is that which answers the question of ‘what an entity is’ and thus defines both its essence and nature of its characteristics. Information relates to both data and knowledge, as data represents values attributed to parameters, and knowledge signifies understanding of a concept. Information is uncoupled from an observer, which is an entity that can access information and thus discern what it specifies; information may exist beyond an event horizon, for example. In the case of knowledge, the information itself requires a cognitive observer to be obtained.” – from Wikipedia article, “Information,” July 26, 2019.

Suppose I begin a game of FreeCell. Once the cards are dealt, the outcome of the game, 0 (loss) or 1 (win) is not determined until I have played through the game (independent of the amount of time required). What information exists on the outcome of the game prior to me playing the game out (again, unless you believe in pre-destiny)? A set of probabilities, potentials. Suppose I quit the game, don't finish, what is the outcome of the game in 0 or 1 terms?<sup>8</sup> This question has plagued, for example, tournament play, where it has long generally been the rule that quitting without finishing the game is considered a concession, forfeiture or loss, but that is just an interpretation to avoid difficulties in tournament play.

These questions lend themselves to the notion that we must be trying to figure this out in the wrong framework, because, there is no reason to think the stars existed only after humans looked to the sky! Most people would say that's absurd, but that is the mechanic in GGDM at least. Nor did gravity come to exist on Earth because humans looked to see if anything could hold them and the atmosphere to the surface. This is sort of a paradox because both arguments here seem valid, colorable, yet both cannot be true. Given the choice then, it is not surprising that scientists choose the objective empirical universe over human consciousness, rejecting certain arguments as 'quantum mysticism.'

- ✓ See John Archibald Wheeler 'it from bit' feature quote and discussion in Hologram Universe, 1 Information, top of p. 1327, *infra*.
- Life, Looking and Luck: Living matter must always be looking to confirm its own continued existence (and object permanence), death occurs when this can no longer happen ("If the cat survives, it remembers only being alive." – Wikipedia, *Id.*).<sup>9</sup> Life is the very first object permanence to itself, and must also be the last:
  - ✓ "Since Jean Piaget first pegged object permanence as a milestone in infant development, psychology researchers have found evidence that ever-younger babies have some sense of it; affirming object permanence seems to be the main theme of peek-a-boo." – Kate Becker, "Is Quantum Intuition Possible?" NOVA, July 28, 2014.

That is, that the cat must be the observer (its own observer) in every moment is the only explanation that makes sense to my primitive understanding. I would offer that this is part of or should be part of, the definition of life – continuous self-observation is life, consciousness.<sup>10</sup> Even if a non-sentient living being could exist, the being would always be able to 'sense' itself and its own continued existence (see tendentious pedant discussion of use of 'sentient' vs. 'sapient' in GGDM, 5 Beginnings, p. 56, *supra*).<sup>11</sup>

- ✓ Meta-consciousness then may be, must be, an emergent from infantile object permanence, where the existence of the human is the most powerful object permanence in the child's universe. See Meta-consciousness discussion, In the Mirror I Meta Me, 2 Constructural Elements, p. 195, *supra*.

But how does the universe 'exist' when no one is looking? Is it the purpose of life to keep the universe in existence?

- ✓ "This is an application of the anthropic principle: We can only observe an environment capable of producing observers." – Matt O'Dowd (City University of New York), "Are You a Boltzmann Brain," PBS Space Time Channel, April 26, 2017.

This is the heart of the quantum interpretation problem, to wit:

- ✓ “Another way of stating this question regards the measurement problem: What constitutes a ‘measurement’ which apparently causes the wave function to collapse into a definite state? Unlike classical physical processes, some quantum mechanical processes (such as quantum teleportation arising from quantum entanglement) cannot be simultaneously ‘local,’ ‘causal,’ and ‘real,’ but it is not obvious which of these properties must be sacrificed, or if an attempt to describe quantum mechanical processes in these senses is a category error such that a proper understanding of quantum mechanics would render the question meaningless.” – Wikipedia, “List of Unsolved Problems in Physics,” captured June 18, 2018.

I have often seen and wondered about people who have terrible luck in board and card games which use randomizers who also display a bad attitude about die-rolling, card drawing, and life in general. Is there a connection between the two? This long-debated but not well-defined question extends beyond the hobby gaming table to our amazement at people who are both incredibly successful and life positive. It extends to educational philosophy, biographical analysis and literary fiction trope. Is this a chicken or the egg argument: Did they succeed because they are positive people, or are they positive people because they succeeded?

- ✓ “Unless you’re winning, most of life will seem hideously unfair to you.” – Oliver Emberton (blog).

But wave function collapse certainly adds another intriguing layer, something suggestive of a connection between mental states and the local universe,<sup>12</sup> does our attitude actually have some effect on ‘random occurrences’ and certain types of local entropic events? Or am I really wondering if ripe apples are like oranges because red is next to orange on the low end of the visible color spectrum?<sup>13</sup>

- ✓ “Heaven, nirvana, hell, it all exists. Not because of the Bible or Quran, or Buddha says it does. It exists because we expect it to.” – Craig Leeham, Einstein’s God Model (2016).
- ✓ What if what we think is objective reality is actually a continuing set of collapsing wave functions, which shift as we look at them? This view is not entirely implausible – you think you walk by pushing against the Earth, but science tells us we walk because the Earth pushes us forward in reaction to us pushing against it. Frame. Work.

---

*“How much would we appreciate La Gioconda today if Leonardo had written at the bottom of the canvas: ‘This lady is smiling slightly because she has rotten teeth’ – or ‘because she’s hiding a secret from her lover’? It would shut off the viewer’s appreciation and shackle him to a reality other than his own. I don’t want that to happen to 2001.”*

– Stanley Kubrick, Playboy Magazine, 1968<sup>14</sup>

---

**Sapience:** Even in astrology, there is the act of looking, whether it is performing whatever process the astrologer performs, or calling your ‘psychic friend’ in New York City (who oddly never calls you first) to ask for your ‘personal horoscope,’ or looking at the newspaper astrology section. You are looking for something.

All of the criticisms of astrology, outlined succinctly by Carl Sagan and others, are valid, within the framework of science. And science is the framework of our current world. But looking is

the essence of sentience – sentience exists to look, it's *a priori* – and sapience is the essence of projecting sentience into the abstract. That's just what we do. But echoing what Carl Sagan said about Ptolemy's astronomy – that “intellectual brilliance is no guarantee against being dead wrong” (Cosmos, Episode 1) – so is sapient projection no guarantee against being delusional.

- ✓ Merriam-Webster online dictionary at *sentience*: **2**: feeling or sensation as distinguished from perception and thought.

Sentience here is being used in a phenomenological sense, to feel or have a sensation is to appear, to be known both that thing which has caused the feeling or sensation, and the thing (to its own self) that has experienced it.

- ✓ “Looking” as used in GGDM is intended in a very broad sense, ranging from sentience to perception, thought, sapience, as at all levels, things ‘appear’ and are known when looking. It is quite unlikely that anyone has argued that inanimate matter looks, feels, experiences anything. Thus looking is the essential quality of living matter at all levels. Living matter cannot turn off sensation, perception, feeling, appearance.

The main distinction to be made between astronomy and astrology is that, of necessity, the astrologer claims to be a messenger from heaven or the cosmos, bringing a personal message *to you*. Astronomy makes no such claims. In modernity, astrology is treated as silly entertainment. If your personal astrologer predicted your death this week, would that be entertainment?

- ✓ **Old Man:** Beware, the Ides of March! **Caesar:** He is a dreamer; let us leave him: pass. – William Shakespeare, “Julius Caesar” (1623).

It might be interesting, if somehow, a setting could be created where astronomy and astrology co-exist equally and probably, asymmetrically, both with empirically verifiable results.

However, astronomy will point you back home from a distant star, astrology will not. Astrology is not portable like astronomy since the constellations only appear as we know them from the perspective of our Homeworld and in our time; so perhaps in such a setting, astrology would be equally valid only on the Homeworld?

- **Stellar Classes:** Very roughly, the stellar classes in GGDM correspond to the classic classifications of stars, which are O, B, A, F, G, K, M, N. The classic mnemonic for remembering the classes of stars is ‘Oh Be A Fine Girl Kiss Me Now.’ For example, the Pleiades is an open starcluster of hot young blue B-class stars that is visible to the naked eye from Earth. The Concierge is free to alter the over-simplistic system for determining stellar class in the game, it can be skewed whichever way is desired, it can be expanded, a more realistic distribution can be introduced. Class dismissed, we meet same time next eon!
  - ✓ The GGDM stellar classes (colors) in order (red, orange, yellow, green, blue), correspond (roughly) to the Hertzsprung-Russell (H-R) Diagram (available on the internet) moving from bottom right to top left. Our sun is a G2V (yellow in GGDM) star.

---

*“And always remember, keep looking up!”*

– Jack Horkeimer, Director, Miami Space Transit Planetarium (Miami Museum of Science), host of PBS “Jack Horkheimer: Star Gazer”

---

**Horkeimer's Rule:** The stars listed on the Starlog are obviously not the only stars in the universe or even in the galactic neighborhood. Activation of the Expansion Power for the purpose of Looking allows positions to look from certain locations to find other stars outside those listed on the Starlogs. Looking attempts may not receive the benefit of any Enlightenment (i.e. no re-rolling) as that would be rather absurd. The game looks only when it matters.<sup>15</sup>

- ✓ If you were an inhabitant or governor of a frontier colony world, when you thought of the sky, which way would your mind gaze? Would your attention run toward the interior, industrial, population and interstellar government worlds of your sovereign, or would your gaze be turned outward to the next stars beyond your world? Where would you *look*? Would your mental Scene be in the Galactic or the Public Space?

This is the true looking rule of the game, the way to understand how this game is played; the players look. When it matters. In the game.<sup>16</sup>

- **Procedural Generation:** The detailed game setup procedure, and the Looking and Scouting rules are very primitive and burdensome (if done manually) procedural generation systems designed to make a theoretically infinite, but practically limited, game universe that is exactly the size needed for play – or as I originally envisioned it in the post-Stellar Conquest days, to make a 3D game universe that is not artificially limited to the space on a flat game board. The emphasis of GGDM is to encourage an engaging emergent game play; GGDM contains structural elements designed for that purpose.<sup>17</sup> Both concepts – procedural generation and emergent game play – were terms unknown to me when the current game was created around 2000 to 2002, so this section translates GGDM into current terminology.<sup>18</sup>
- **Looking Up:** Any colony, Scout, or Warship that begins the Regular Turn at a starsystem that has any X, Y, or Z coordinate less than or equal to 5, or greater than or equal to 25, may Look for new stars not currently on the Starlog. Each eligible star may only be used for Looking *once* in each game; that is, once one position has used a star to Look, no other position may Look from that star for the rest of the game for the simple sane reason that once the stars beyond are discovered, they cannot and should not be changed or added to by subsequent looking from the same star. A record, visible to all, will be kept of stars used for looking on the central Starlog page so that positions are informed and do not waste Activations.
  - ✓ Remember, a Scene is required and thus, the star must have been on the Public Space at the end of the previous Regular Turn. Thus the ship or colony must begin the current turn in the starsystem used for Looking.
  - ✓ New stars can appear nearby as a result of Looking from other locations; thus, the edges of the Galactic Space can be fluid until all stars in an area have been used for Looking. This can, admittedly, create some strange game situations that are a consequence of this particular looking mechanic; for example, if a position begins the game near the edge, stars can appear nearby that should have been there initially.
- **Looking Out:** Looking begins with a d10 roll to determine how many stars are nearby; the number of stars currently within 8 movement distance based on the Movement Formula used by the Generic Stardrive Existential Patent, is subtracted from the die roll. If the resulting number is greater than zero, that number is the number of new stars discovered by Looking.

The more populated the neighborhood, the less new neighbors you will find! *Or.* The farther out you are, the further out you will be!

- Looking Sideways: For each star discovered by Looking, a ten-sided die is rolled once for each coordinate. The result of the die roll is subtracted from the X, Y, or Z coordinates of the Looking location *if any coordinate is less than fifteen, or added if any are greater than fifteen*. Negative numbers or numbers higher than 30 are possible and likely.
  - ✓ For example, the Looking location is X5, Y20, Z18. Looking is allowed from this star because of the X5 coordinate, *ut supra*. The others are irrelevant.
  - ✓ One new star is located by Looking from that location, the die is rolled once for each coordinate with 8, 6, and 2 results.
  - ✓ Subtracting and adding from the Looking location's coordinates as described above, the location of the new star would be at X-3, Y26, Z20, located 16 movement from the Looking location using the Generic Stardrive Patent's Movement Formula.

Further Looking may subsequently be done from stars discovered by previous Looking, so that the Galactic Space is effectively infinite. Since stars are large bright physical objects in the sky, their location is perfectly obvious to everyone, therefore, a new star 'discovered' by Looking is added to the game's central Starlog and is available to all positions, and may be announced via Special Bulletin.

- ✓ GGDM necessarily assumes that all Major Races are capable of 'seeing' stars. A 'blind' species would not know there is a sky, only an infinite up and finite down.
- Looking Inward: The initial Starlog has coordinates in X, Y and Z from 0 to 30, and all of the starting positions and starsystems are located within that +++ quadrant. The initial Starlog does not have any negative coordinates. Thus, stars with coordinates from 0 to 5 and 25-30 represent the stars on the outer edge of the initial Galactic Space.

This system makes the initial Galactic Space playing area of the game inviolate; no new stars should appear inside the initial playing area (for game sanity). It must be assumed then that the 30 stars on the initial Starlog are all of the stars within the cube of X1-30, Y1-30, Z1-30. Either this represents a truly miniscule piece of Galactic Space, or, if the initial Galactic Space represented a spherical radius of say, 50 LY, then it is unrealistic that new stars would not be 'discovered' within the sphere of only 30 stars (*ut infra*, next page).

- Looking Through: Finally, for each new star, one die must also be rolled for the stellar class of the star (i.e. the color), on a result of 1 the color is red, on a result of 2 or 3, the color is orange, on a result of 4, 5 or 6, the color is yellow, on a result of 7, 8 or 9, the color is green, and on a result of 10, the color is blue. This information will be recorded, available for all.

Each position will be assigned, during set up, a stellar class of their Homeworld star, even if their homeworld (i.e. the world on which their species evolved) is not in the Galactic Space. During the game, the stellar class of each star in GGDM is a determining factor, in percentages, of Habitability Class of planets in the starsystem, with positions most likely to find Optimal and Hospitable Class planets in starsystems with a stellar class identical to or close to the stellar class of their home star. It's only natural. But it creates an interesting dynamic.

- ✓ For example, a position whose Native Population Type evolved in a system with an 'orange' star (in GGDM stellar classifications) will most likely find Optimal and Hospitable Class planets at orange starsystems. The chance of finding Optimal Class

planets at either red or yellow class systems is significantly less, and is extremely unlikely in green or blue starsystems. But the chance of finding Hospitable and Habitable Class planets is still decent or good in red or yellow class systems. *Und so weiter.*

The stellar classes do not loop, that is, red class stars are not next to blue class stars on the spectrum. Thus, species that evolved in blue or red class stars (the extremes) will likely find less stars of those classes in the Galactic Space, and also, will only have one adjacent color, which will also be slightly less numerous than the orange and yellow mainline stars. On the other hand, paw, tentacle, orb, whatever, there will be significantly less competition for living space in blue and red stars than among species evolved in orange, yellow, or green stars.

- **Looking Around:** Discovery of a new star via Looking does not grant ownership or any rights not enforced by arriving with warships first. New stars are like the old stars, they are *terra incognita* and *terra nullius* and may be subsequently explored, colonized, and conquered as any other starsystem.
  - ✓ Looking could be altered to allow new stars to appear inside the original Galactic Space if participants desire more ‘realism’ or want to experiment. See discussion Stage Illusions, 1 The Sidereal Stage, p. 107, *supra*. I do not believe it necessary.

---

*“If there are millions of civilizations in the Milky Way each capable of radio astronomy how far away is the nearest one? If they’re distributed randomly through space then the nearest one will be some 200 light-years away. But within 200 light-years there are hundreds of thousands of stars.”– Carl Sagan, Cosmos, Episode 12*

---

**Realspace:** This suggests that the Galactic Space is probably a tiny area indeed. This also suggests that even at sub-light speeds, outbound from the Earth, there are probably thousands of planets that could be colonized.

- ✓ “About one third of the stars visible with the naked eye lie within 250 light years, even though this is only a tiny part of our galaxy. There are 133 stars visible with the naked eye within 50 light years of us.... The Hyades cluster is the nearest major star cluster and the only one close enough to be mapped in three dimensions. The Hyades cluster is a bright object in Taurus, but the view is partially ruined by Aldebaran – a brilliant orange giant star that lies in front of the cluster at less than half the distance. The cluster itself is 151 light years away. It was formed about 660 million years ago and the cluster has probably gone around the Galaxy three times since then. Like most open star clusters, the stars in the cluster are slowly moving apart.” – captured June 22, 2018, from website <http://www.icc.dur.ac.uk/~tt/Lectures/Galaxies/LocalGroup/Back/250lys.html> (Institute for Computational Cosmology, Durham University, UK; website has some cool 3D star maps).
- ✓ “As many as 512 or more stars of spectral type G (not including white dwarf stellar remnants) are currently believed to be located within 100 light-years (or 30.7 parsecs) of Sol – including Sol itself. Only around 64 are located within 50 light-years (1y), while some 448 are estimated to lie between 50 and 100 light-years – a volume of space that is seven times as large as the inner sphere within 50 ly of Sol. A comparison of the density of G-type stars between the two volumes of space indicates that the outer spherical shell has around 100 percent of the spatial density of known G-type

stars as the inner spherical volume, which suggests that astronomers have identified the great majority of the G-type stars that are actually located within 100 ly of Sol, assuming the same spatial distribution in the Solar neighborhood... As of October 2005, astronomers have been able to detect the presence of planets around only 28 G-type stars (including Sol) – or around 5.5 percent – of those 511 stars located within 100 light-years of Earth.” – captured from <http://www.solstation.com/stars3/100-gs.htm>, on June 22, 2018.

This awesome free website, last updated in 2013, has a tremendous amount of information, including a table of all G-stars within 100 light years and, back-browsing, interactive maps, tools.

---

*“Somewhere out there, something incredible is waiting to be known.” – Carl Sagan*

---

*“We began as wanderers, we are wanderers still. We have lingered long enough on the shores of the cosmic ocean. We are ready at last to set sail for the stars.” – Carl Sagan*

---

**City on the Edge of Forever:** Who knows what you will run into out there? That’s why we go (or possibly don’t go). It’s also why we bring a gun. It is probable that positions will encounter each other during exploration and/or that exploring ships may encounter **alien colonies**, Minor Races, and whatever other strangeness the Concierge decides to put into the game. When units and colonies owned by different positions encounter each other for the first time, it is resolved per the First Contact Rules (see Bump in the Night, Diplomacy, p. 1099, *infra*); treatment of Minor Races is described in Mathó Thípila, 4 Diplomacy, p. 1140, *infra*. Finally, the practical limitations and considerations of what ships, colonies see is described in 2 Information, *infra*.

**A Hostile Class Love Story in 150:** A jilted and jealous lover attempted to commit suicide and mass murder by explosively decompressing the domed research colony. Twenty of one hundred colonist survived in an emergency shelter control room.

When the supply ship arrived a year later, bearing news of turmoil at home, a few less than a score of colonist remained; the jilted lover, overtaken at the last moment by survival instinct, had dashed to the shelter before the catastrophe. The supply ship, loaded with a new colony of 150 persons and another pressure dome, had no spare room to take off the survivors.

After an incident that destroyed the supply shuttle at the colony, the supply ship departed leaving behind the survivors and their hostages. Many years later, another supply ship arrived to find a few survivors who were not quite the same species as those who landed... EOM.<sup>19</sup>

*“There are now five different lines of observational evidence pointing to the existence of Planet Nine,’ Konstantin Batygin, a Caltech planetary astrophysicist, explains. ‘If you were to remove this explanation and imagine Planet Nine does not exist, then you generate more problems than you solve. All of a sudden, you have five different puzzles, and you must come up with five different theories to explain them.’”*

– Mike Wehner, “NASA says evidence for Planet Nine is mounting,” foxnews.com, October 18, 2017

---

## Endnotes.

<sup>1</sup> Commentary: On Wednesday, November 7, 2018, Washington Capitals forward T.J. Oshie had a rough night; first he was hit in the eye under the visor with a stick and had to leave the game in the 1<sup>st</sup> period, then in the 3<sup>rd</sup> period, he was in a violent collision with Pittsburgh Penguins forward Evgeni Malkin in which he was hit in the head by Malkin's shoulder (Malkin was ejected from the game), and Oshie had to leave the ice for concussion protocol. I had a feeling he would return, and when he returned in the latter part of the 3<sup>rd</sup> period, and was active on the ice, I just got this feeling that he was going to score a goal. Somehow, it just felt 'right' and indeed, he scored the winning goal. How did I know? I have watched many baseball, hockey, and football games; it just felt predictable. That is literally what I thought at the time, it was predictable. But how?

- ✓ By one common philosophical argument of knowing, I 'knew' because I was right – no matter how – and had it not happened, my feeling would have been a 'belief' and not knowledge. Not JTB.
- ✓ A critical approach would suggest that I am highlighting all of the times it happened and ignoring the times it didn't happen. That still does not explain my intuition of the moment. I have seen this too many times before. Sean Young was traded back to the Pittsburgh Pirates after a horrific time in Atlanta, arrived just in time to dress for the game, but was not a starter. In extra innings, he came in as a pinch hitter and hit a walk-off home run over the wall. I have lost count of the number of such – what should we call them? – synchronicity moments over the years, and I was not thinking of those at the moment I had that intuition about T.J. Oshie. Was the expectation created in both instances by the broadcasters? And they just got lucky that a really special moment happened after their buildup? Ok, but I have seen it in person, without broadcasters in my ear. I was at the game where Josh Harrison broke up the no-hitter in the 10<sup>th</sup> inning with a homerun. I suddenly thought it would happen, and mentioned it to my friend when Harrison came to bat. I was also at a Penguins playoff game that went to overtime, I thought and said to my friend, that we would win quickly, and indeed, the Penguins scored a winning goal 30 seconds into the overtime. By definition, as they had not happened yet, no evidence was available to support my knowledge.
- ✓ See discussion of pre-theoretical intuition, *The Fine Print-isms*, 1 Temporal Technology, p. 811, *supra*.

<sup>2</sup> Commentary: If you look up in the sky long enough, without blinking, moving or looking away, you will eventually see stars...one way or the other...or if someone whacks you in the back of the head for not paying attention.

<sup>3</sup> Citation: Merriam-Webster 11<sup>th</sup> Collegiate Dictionary.

<sup>4</sup> Commentary: For example, we tell children to look both ways before crossing the street. What we are trying to make them understand is something more than simply seeing; we want them to process, pay attention, judge.

<sup>5</sup> Commentary: I am aware of the potential charge of "quantum mysticism." *Nolo contendere, ad altiora tendo!* And the same goes for any suggestion of a creator or supreme deity.

- ✓ The sibling of modern quantum mysticism is "nuclear mysticism" which one of its main proponents, Salvador Dali, visualized in a painting, "Living Still Life" (1956). "Nuclear Mysticism is composed of different theories that try to show the relationships between quantum physics and the conscious mind. The different theories are composed of elements that range from 'Catalan philosophers' to 'classicism, pop art, and nuclear physics.'" – from Wikipedia article, "Living Still Life," citing to E. Baden (2011).
- ✓ "Quantum mysticism in the sense of consciousness playing a role in quantum theory first appeared in Germany during the 1920s when some of the leading quantum physicists, such as Erwin Schrödinger, leaned toward such interpretations of their theories." – from Wikipedia article, "Quantum Mysticism," manifested on my computer, February 7, 2019.
- ✓ The early controversy died off by the 1950s, to be revived later in 1961. By the 1970s, it had become part of the New Age culture (possibly ranging to manifestation).

<sup>6</sup> Citation & Commentary: Mr. Gribbin perhaps uses some unfortunate language (such as electrons 'knowing'), unfortunate perhaps in his choice of words to convey the concept to lay readers, but also unfortunate because our language is still mythopoeic-anthropomorphic (and geo-centered, as Sagan pointed out) and lacks other words to convey the meaning more accurately. I am not a proponent of the electron 'knowing' anything, they should just remain ignorant, pay taxes, make baby electrons (quarks?) and vote for whomever the party bosses put up on the podium.☺

- ✓ "What we see is what we get. An experimental observation is only valid in the context of the experiment and cannot be used to fill in details of things we do not observe. You might say that the double-slit experiment tells us that we are dealing with waves; equally, by looking only at the pattern on the detector screen

you can deduce that the apparatus has two holes in it, not one. The whole thing is what matters – the apparatus, the electrons, and the observer are all part of the experiment. We cannot say that an electron goes through either hole, without looking at the holes as it passes (and that is a different experiment). An electron leaves the gun and arrives at the detector, and it seems to possess information about the whole experimental setup including the observer. As Freyner explained to his BBC audience in 1965, if you have an apparatus that is capable of telling which hole the electron goes through, then you can say it either goes through one hole or the other. But when you have no apparatus to determine through which hole the thing goes, then you cannot say that it goes through one hole or the other. ‘To conclude that it does go through one hole or the other when you are not looking is to produce an error,’ he states. The term ‘holistic’ has become such a misused buzzword that I hesitate to introduce it. However, there is no word more apt to describe the quantum world. It is holistic; the parts are in some sense in touch with the whole. And it doesn’t just mean the whole of an experimental setup. The world seems to keep all of its options, all of its possibilities, open for us as long as possible. The strangest thing about the standard Copenhagen interpretation is that it is the act of observing a system that forces it to select one of its options, which then becomes real.

In the simplest experiment with two holes, the interference of probabilities can be interpreted as if the electron that leaves the gun vanishes once it is out of sight, and is replaced by an array of ghost electrons that each follows a different path to the detector screen. The ghosts interfere with one another, and when we look at the way electrons are detected by the screen, we find traces of this interference, even if we deal only with one ‘real’ electron at a time. However, this array of ghost electrons only describes what happens when we are not looking; when we look, all of the ghosts except one vanish, and one of the ghosts solidifies as a real electron. In terms of Schrödinger’s wave equation, each of the ‘ghosts’ corresponds to a wave or rather, a packet of waves, the waves that Born interpreted as a measure of probability. The observation that crystalizes one ghost out of the array of potential electrons is equivalent, in terms of wave mechanics, to the disappearance of all of the array of probability waves except for one packet of waves that describes the real electron. This is called the ‘collapse of the wave function,’ and bizarre though it is, it is at the heart of the Copenhagen interpretation, which is itself the foundation of quantum cookery. It is doubtful, however, that many of the physicist, electronics engineers, and others who happily use the recipes in the quantum cookbook appreciate that the rules that prove so reliable in the design of lasers and computers, or studies of genetic material, depend explicitly on the assumption that myriad ghost particles interfere with each other all the time, and only coalesce into a single real particle as the wave function collapses during an observation. What’s worse, as soon as we stop looking at the electron, or whatever we are looking at, it immediately splits up into a new array of ghost particles, each pursuing their own path of probabilities through the quantum world. Nothing is real unless we look at it, and it ceases to be real as soon as we stop looking.” – John Gribbin, *In Search of Schrödinger’s Cat* (1984), pp. 172-173.

- **The post-millennial version:** “Quantum field theory describes the interactions between particles as the sum total of all possible interactions that can lead to the same result. ... Every interaction with virtual photons that can happen, does. At least, in a sense. And the sum of the infinite possible interactions defines the strength of the one real interaction. And if that doesn’t make your head hurt, try thinking about it again. So yeah, quantum field theory is a type of madness.” – Matt O’Dowd (City University of New York), “Quantum Theory’s Most Incredible Prediction,” PBS Space-Time Channel, August 15, 2018.

Since the end of the Cold War, and possibly since the millennia, there are a number of card games that use this idea. You have a hand of cards, you must (or should if you are being competitive) try to play one or more of the cards when possible. Each card represents a possibility of what you might do, a possible future for your position in the game. Each has its pros and cons, and unknown or unknowable possibilities in terms of what you might draw, what your opponents might do, or die rolls, and such. You take your best guess and play a card. What makes the newer card games more interesting, is that you must (unlike old card games), pay-to-play by discarding cards from your hand to play a card, the process of doing so eliminates possible futures, possible timelines for your position by the act of choosing one to play on the table (and discarding others to pay for it). This intuitively reflects our lives when we stop to think about it, and also reflects quantum physics and that is sublime to me. This is what I see in games like *Race for the Galaxy* and why I have continued to play that game daily long after most gamers have forgotten about it. There have developed a number of other card games that use the same mechanic, and many board games (e.g., the underrated and forgotten board game *Lyssan*) in recent years have adopted this style of card play.

✓ My copy of Gribbin’s book looks like a venerable ancient text, according to a friend who borrowed it a few years ago, with its creased and worn cover and spine. It has a long history in my possession (i.e. Temporal 2 Expansion – Horkeimer’s Rule

Constructural Element), moving from place to place. I sat on the deck of the U.S.S. Tuscaloosa (LST 1187) and read it in the summer of 1988 on my way to the Philippines and Hong Kong. As such, in terms of science, Mr. Gribbin's book is, like me, a bit 'dated' and further, I sense, would be met with derision in the scientific community (like GGDM), Gribbin rather alludes to that above. They probably don't teach this in high school for the same reason they don't encourage teens to read science-fiction stories even now: Temporal authority must be completely objective, hard and fast, undeniable, beyond each of us, and in control (as Gatto and others have pointed out), no wishy-washy science of ghost probabilities or power to collapse wave functions by the act of observation are allowed to taint the youthful minds. I was fascinated by quantum tunneling of alpha particles who lack sufficient energy to escape the potential energy well (long before I heard of quantum entanglement, etc.) which I think I discovered on my own in high school and I recall doing a class presentation project on it in 11<sup>th</sup> grade; I had an unusual teacher however. Quantum tunneling, as I understood it in high school, suggests to the young mind that one might 'magically' escape and suddenly find oneself outside the bounds of whatever situation or system one finds themselves in (and I did just that after high school), regardless of rules, math, and probabilities. And so here I am, here I sit.

The quantum concepts have only very slowly crept into the Western consciousness in the last century and very little of science-fiction literature uses it (despite its apparent fertility for science-fiction concepts). The most notable science-fiction setting that I recall using the fascinating observer-triggered probability collapse is the Andromeda television series where it is the basis of Slip Stream travel (see 'quantum intuition' discussion, *Trans-human Touch-down*, 1 Stardrive, p. 784, and Andromeda Wiki feature quote at the top of 3 Movement, p. 854, *supra*).

<sup>7</sup> Commentary: Thus in looking, we are roughly 'forcing' something into 'reality' against 'its' will, or without 'its' consent. Is that an absurd concept? Yet, it has parallels to the fact that all of us were born – brought into existence, ontologically by the acts of others – without our consent, and cannot be unborn, regardless of what we do (short of creating a paradox). It's just a metaphysical observation and not much more, if life has a pre-conception state, we have no idea where to look for it right now. That is, we have no empirical evidence of such right now, but it would be some great epic fiction. If life has a preconception state, don't picture babies in heaven or souls floating about waiting to be born; no it will be something much, much stranger still and related to abiogenesis.

<sup>8</sup> Commentary: I have no answers to offer, but I am sure that someone much brighter than me has figured this out already. I am sure there is some math solution to the question of what if it is neither 0 nor 1 in a system that allows only 0 or 1?

<sup>9</sup> Citation & Commentary: "...your physical body exists only to confirm your existence." – Serial Experiments Lain, Episode 6 (1998). In the series, Lain eventually has to give up her physical body in the Real World to inhabit the Wired. Lain cannot then cross back over into the real world and exists here only in the memories of those who are aware of her existence (this is referenced in the Wikipedia article in relation to a philosophical society talk given by Professor Susan Napier in 2003, "The Problem of Existence in Japanese Animation" (published 2005)).

- ✓ About fifteen years ago when I watched Serial Experiments Lain in its entirety, I was not aware of Russian Cosmism and was only vaguely cognizant of Transhumanism. But revisiting the series in the current context, it is clear that discarding the physical body to enter the Wired is related to the concepts of Russian pre-Cosmism (see excerpt from book by George Young in *The Sidereal Stage*, *supra*) and it is not coincidental that there is a link to the Noosphere article at the bottom of the Wikipedia article on Serial Experiments Lane. This form of ascension is not uncommon in science-fiction literature, of course.

<sup>10</sup> Commentary & Citation: Steven R. Donaldson's two volume series Mordant's Need (1986-1987) comes somewhat close to this; the main character Teresa lives in an apartment covered in mirrors, so that she can always know that she still exists. Though I read this in the late 1980s after having read the First and Second Chronicles of Thomas Covenant trilogies (1977-1979, 1980-1983) and Daughter of Regals and Other Tales (1984), I do not believe it is directly the source of my commentary here.

<sup>11</sup> Citation & Commentary: "...appearing is being known." – Avi Sion, from abstract for his book Phenomenology (2003). Thus living matter, from a phenomenological view, must always be appearing to itself and when it cannot, when that condition ceases, it is organic non-living matter.

- ✓ The point of distinction that GGDM makes from phenomenology is the emphasis on looking, or more properly, appearance through looking. This extension of phenomenology into quantum interpretation – the horror of physicists worldwide – is where sentience and sapience are properly situated.

<sup>12</sup> Citation: "Time lines can not only interfere with each other, they can alter or even erase aspects of each other, and the potentials of each other as a whole. Or in terms of the plot of the film [Looper, 2012], young Joe's short term

future can alter his long-term future, which is ultimately, old Joe's past, hence, the memory fuzziness described by old Joe in the diner.

All of which is quite resonant with the structure of quantum entities, whether or not Johnson did this intentionally, or, as he has indicated, by instinct. According to quantum physics, sub-atomic entities aren't quite particles, and this is why, after at first depicting electrons as tiny satellites in fixed orbits around the central atomic nucleus, physicists came increasingly to depict electrons as fuzzy 'clouds' which hover around a nucleus. What's particularly difficult to grasp about this, however, is that electrons aren't spread out like a rain cloud, but rather, the electron and the space and time in the area of the so-called cloud are, to use a popular metaphor in the science literature, 'smeared' within and through each other. That is, while a rain cloud is full of little drops of water, there is only one electron in the spacetime of the cloud, and it could show up anywhere in there, but its location within this is, in a sense, 'fuzzy.' The reason for this is that quantum entities, which are only described as particles by scientists today as a short-hand, simply don't follow the laws of time and space like large entities do, they're able to be in more than one space and time at once, even if more intensely in some of those spaces and times than others. What's more, they interfere with each other, in a manner not all that dissimilar to what is described in *Looper*.

This is why we can think of old and young Joe as being similar, in many ways, to quantum entities. As they get closer to each other, in space and time, their actions increasingly begin to interfere, not only with each other in the present, but in the past and future as well. This manifests in the way in which young Joe's actions can rewrite old Joe's memories, or to the extent that the memory of one character is the future of another, also impact their potential future paths." – Christopher Vitale, "Collapsing the Fuzzy Wave: Rian Johnson's 'Looper' (2012), Quantum Logics, and the Structures of Time Travel Films," networkologies (blog), written in 2012, updated and reposted, October 31, 2014.

<sup>13</sup> **Commentary:** The classic mnemonic for remembering the color spectrum is ROY G. BIV which stands for Red, Orange, Yellow, Green, Blue, Indigo, and Violet. The first five are the Stellar Classes in GGDM.

- ✓ Within our solar system, 'My Very Educated Mother Just Served Us Noodles' is a way of remembering Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune. Watch out for the Klingons circling...
- ✓ In the orders of life on Earth, in 7<sup>th</sup> grade we learned 'King Philip Came Over for Grape Soda' which stands for Kingdom, Phyla, Class, Order, Family, Genus, Species. *Homo Sapiens* are the only surviving species of genus Homo, which of course is the flash-point of much evolutionary-religious debate.

<sup>14</sup> **Commentary:** La Gioconda is known in English as the *Mona Lisa*; the model who sat for the painting was Lisa del Giocondo and it was painted for her husband. Mona is a polite form of address, like Mrs. in English.

<sup>15</sup> **Commentary:** The first rule to surviving a military inspection – or any inspection – is to pass on the first look. If the inspecting officer sees anything wrong or out of place, they will look more closely, start looking behind the facade. It's human nature. And cat nature. There are certain people who live on the edge, they make business deals, communicate and/or act in ways that are borderline unethical and possibly illegal at best. They talk the talk, act like big shots, connected with all the right people, knowing it all about how the game is played. They can do this as long as no one is *looking* – until something happens, some event, or events, something beyond what they imagined, that brings the gaze of a prosecutor, special investigator, or grand jury in their direction.

<sup>16</sup> **Commentary & Citation:** Yes, I am aware that by my suggestions here I will be branded as the greatest scientific heretic, criminal of the 21<sup>st</sup> Century by the respectable scientific establishment (if they notice and *think it matters*); this very debate has arisen in 2020, e.g., Dr. Sabine Hossenfelder's video, "Is COVID there if nobody looks?" (YouTube channel, June 28, 2020); Frau Hossenfelder is a Fellow at the Frankfurt Institute for Advanced Studies.

<sup>17</sup> **Commentary & Citation:** As opposed to, for example, the infinite procedurally generated universe of *No Man's Sky* (in its original form; they added a backstory, guilds and procedurally-generated missions later), which was roundly criticized as an overpriced, flat and soulless game-play experience (however, according to Gita Jackson at [kodaku.com](http://kodaku.com), a year later after several expansions, "No Man's Sky is good now").

<sup>18</sup> **Commentary:** How is this for an example of a looking problem: I have observed many instances of the computer stating that it cannot find (i.e., 'no results') the word I typed to search in an open document, yet I am looking at the word it says it cannot find? I have seen instances where it jumped to the location of the word I searched, yet claimed that it cannot find the word in the document. It is displaying the word, I am looking at it; the machine obviously 'knows' it is there if it is displaying it, yet it cannot find it in the search function? I am sure there is a discipline term or name for this phenomenon somewhere in computer science, just as there are names for this phenomenon among humans.

<sup>19</sup> **Commentary:** No humans were harmed in the making of this story.

*“On through the never  
We must go  
On through the never  
Out to the  
Edge of forever  
We must go  
On through the never  
Then never comes!”*

– Metallica, “Through the Never” (1991)

**Level 13:** If participants wanted to add occult to a GGDM game, the movie *The Risen* (2017), and especially the ending, provides a good starting point. The puzzle-mystery-building part of the movie is important; the Concierge might be able to execute something similar in game. I do admit that I thought the dialogue sounded a little off and the fight scenes were oddly clunky (but not worse in either case than most RPG sessions), but I liked the movie – as for reviewers, they were mixed with some being very cruel and condescending as usual, and as usual, audience reviews were generally kinder. The movie seemed to be a live-action descendent of board games like *Level 7* (2010) and *Tannhäuser* (2007). I was also reminded of my first cooperative board game, *Vanished Planet* (2003) and even somewhat of the movie *Event Horizon* (1997).

- ✓ I wonder if the writers of *Event Horizon* (1997) were listening to “Through the Never” (1991) on repeat? Fan music video: “Through the Never”/Event Horizon.
- ✓ “Never mind that noise you heard, it’s just the beasts under your bed, in your closet, in your head!” – Metallica, “Enter Sandman” (1991).
- ✓ “The first time I ever saw a horror movie, I think I was in middle school, and we watched ‘I Know What You Did Last Summer’ and ‘It’ at a slumber party.” – Jessica Rothe (actress).
- ✓ See also *DEATH OF A YOUNG GROUNDHOG*, 4 Fallen to Earth, p. 1551, *infra*.

**Through the Never:** Any *Scout Ship* that:

- 1) Departs from any system (no Scene required),
  - 2) Whose destination is a system that does not have a supporting colony,
  - 3) Must do so by activation of the Expansion Power for the purpose of Scouting.
- **Then Never Comes:** Whenever a Scout (or any non-warship) arrives in any starsystem unexplored by its owner, a ten-sided die must be rolled, exploration attempts are automatic and do not require a separate Power Activation. ***Each ship entering at the same time must make a separate roll.*** On a result of 1-4 (or 1-5 for any other non-warship that may accidentally find itself in an unexplored system), the Scout is destroyed by unknown hazards in the system, or because the Scout’s systems failed, or just because whatever. If at least one Scout (or ship) survives the Hazard Roll, the system is automatically explored and planetary and other information is received for the system. See 2 Information generally, *infra*, regarding what information is received in GGDM. Additionally, a star must be placed on the Scout owner’s Public Space and the Scout is then placed on the star. Planets of the system are not placed on the Public Space until they are colonized or conquered.

- ✓ As noted previously in Exploration, 1 Expansion, p. 876, *supra*, Scout Ships are considered to have Constructural Elements and thus can benefit from Enlightenment in Hazard Rolls if the ship's Epistemological Constructural Element is active. Enlightenment must be assigned/attached to a Scout Ship individually whenever the Expansion Power is activated for the purpose of Scouting in order to be used during Hazard Rolls or Combat. It will be subtracted from the Colleges and remain with the Scout until a Hazard Roll (or Combat) situation causes it to be used or the Scout is destroyed.

Use of Enlightenment for Scouts is a trickish issue. A Scout that is destroyed is no longer out there and must be replaced with a new Scout, which must be constructed and moved to the frontier. A position that has lost most of its Scouts suffers a 'Scout drought' and is blinded; this is a situation that used to occur frequently mid-game in the Stellar Conquest board game. The use of Enlightenment on Scouts might help with surviving the poking around part. Scouting isn't 'honey badger don't care'! Scouts do take care.

- The Air You Breathe: It does not matter how many times the system has been explored by other positions previously, *the process of exploration is individual for each position due to the unique Native Population Type of each position's species (ut supra)*. The first time a system is explored, the Concierge will establish the number of planets in the system, which could be from zero to ten, and the orbit numbers those planets occupy. This data is completely objective, all positions exploring a system will see the same number of planets and the same orbital information; what is relative to the species is the other half of the planetary data: Each species will see only their own *subjective* Habitability Class and Maximum Habitability data for each planet. See Habitability and Day World, 3 Taxation & Census, pp. 315-316, *supra*.
  - ✓ As noted previously, the game does not naturally look for details beyond orbit number (for reference) and Maximum Habitability and Habitability Class; e.g., the game does not make a record of moons, asteroid belts, or solid or gaseous planets, or whether moons are habitable or made of blue cheese.
  - ✓ It is quite possible and quite probable for two positions to have completely different data on a planet, one may see it as a Garden of Eden, the other as the Gates of Hell. It just depends on the air you breathe.
- Never Achievable: Exploration is the primary culprit of spatial injustice in GGDM; there is, and is not intended to be, anything fair about it. It is probable during the game that some positions might have better or worse luck in finding colonization sites; they might be squeezed by decisions of other positions to expand in their direction, or they may have bad luck with Hazard Rolls that mean other positions get there first. The Concierge should avoid Intervention for the purpose of 'evening up' the game for any position or leveling the 'playing field' for all positions – either to aid or hinder expansion and exploration – rather, the participants should play the game out as the geography of the game develops (as any tile flipping exploration game), realizing that spatial injustice makes the game (if not life) more interesting.
  - ✓ "Perfectly even development, complete socio-spatial equality, pure distributional justice, as well as universal human rights are never achievable. Every geography in which we live has some degree of injustice embedded in it, making the selection of

sites of intervention a crucial decision.” – Edward Soja, “The City and Spatial Justice,” JSSJ, January 2009.

- ✓ See also ‘fairness’ discussion, Balancing the Pin, 2 Patents, p. 735, *supra*.

[Dr. Who opening monologue]

**Question:** *why do we talk out loud when we know we’re alone?*

**Conjecture:** *because we know we’re not. Evolution perfects survival skills. There are perfect hunters. There is perfect defense.*

**Question:** *why is there no such thing as perfect hiding?*

**Answer:** *how would you know? Logically, if evolution were to perfect a creature whose primary skill were to hide from view, how could you know it existed? It could be with us every second and we would never know. How would you detect it? Even sense it? Except in those moments when for no clear reason, you choose to speak aloud. What would such a creature want? What would it do?*

[Later] *Suppose that there are creatures that live to hide. That only show themselves to the very young or the very old or the mad! Or anyone who wouldn’t be believed.... “What’s that in the mirror, or the corner of your eye? What’s that footstep following but never passing by?”*

– Dr. Who, “Listen” (2014)

**Send the Enterprise!:** Warships may be used for exploration; Cargo Ships and Colony Ships are each respectively limited to destination systems that have a supporting colony (Cargo Ships) or that have a Scene (Colony Ships), thus can never be sent to an unexplored star by operation of the rules (e.g., see Colonization, 1 Expansion, p. 876, *supra* and Cargo Ships in Combat and Green Goods, 1 Commerce, pp. 1186, 1188, *infra*). Warships departing for any destination that does not have a supporting colony, must do so by activation of the Combat Power for the purpose of Combat Movement (see Move Out!, 1 Combat, p. 942, *infra*). Warships have a better chance than Scouts of surviving the hazards of exploration, but they are limited by current Operational Flight Limitations (OFL) and Operational Supply Limitations (OSL). Thus, a program of exploration with warships only would be slow and expensive, requiring the constant establishment and protection of new, sprawling ‘grapevine’ colonies to support the warships. But it may be a good or necessary strategy in some instances.

- ✓ Curiously, the peaceful near-utopian Federation always sent a warship commanded by a loud-mouthed, tin-plated captain with a star-system-sized ego “to explore strange new worlds and seek out new life and civilizations.” But not Klingons, of course, the Federation is prejudiced against Klingons. The Enterprise was eventually hauled away by a garbage scow.
- **Heard it Through the Grapevine:** ‘Grapevine’ colonies existed in the original Stellar Conquest board game (e.g., James G. Branaum, The Space Gamer #25, November 1979); they are small colonies placed at strategic stars to provide a supporting colony for interstellar flight Power Activations that require a supporting colony at the destination system. These outposts also provide a place to return before OSL expires and serve as a ‘tripwire’ when other position’s ships enter the system.

The concept soon became common language in sci-fi gaming:

- ✓ “Rather than moving the facility, Lucan increased its defenses, placing a small fleet in the system and several tripwire flotillas along likely avenues of approach. ... Dulinor, swinging through Massilia to come at Lucan from an unanticipated direction, swept aside Lucan’s screening forces in several short engagements. Although each battle was a clear victory for Dulinor, each trimmed his fleet back by a few more irreplaceable vessels, and the warning given by the screening forces gave Lucan time to assemble his reserves at Omicron...” – Dave Nilsen, “When Empires Fall II,” Challenge Magazine, Issue 69, February 1993.
- Prime Timeline: Participants may envision exploration with warships as being something akin to the missions of the Enterprise in the Star Trek Prime Timeline. However, the Federation’s warships were designed – along with officer training, crewing, and institutional outlook – for the dual role of combat and exploration and had the supporting technology for that mission whereas, *in GGDM, warships are mainly warships*, are warships first (like Klingon Birds of Prey), thus the support requirements. Fans of the franchise lamented the dark ending of ST: Deep Space 9 series and the ‘militarization of Starfleet’ brought about by the Dominion War. According to Memory Alpha wiki, in the post-millennial Star Trek reboot Kelvin Timeline (Star Trek: Into the Darkness) the Federation did have a Dreadnought-class ship, an AI-powered, minimum crew, heavy warship-only designed with the assistance of Khan Noonien Singh. Thus series drift into loud, colorful militant space opera continues.<sup>1</sup>
- Dead Before the Opening Credits: Each warship entering an unexplored system must make the same Hazard Roll as Scouts. The difference is, that if a warship fails the Hazard Roll, it may reroll the Hazard Roll (the only time a warship is ‘enlightened’!), and is only destroyed if it failed all Hazard Rolls. A 1<sup>st</sup> Era Warship must reroll once if it fails the Hazard Roll, a 2<sup>nd</sup> Era Warship may reroll twice, and a 3<sup>rd</sup> Era Warship may reroll up to three times. Warship Hazard Roll rerolls stop as soon as the ship survives a Hazard Roll. As such, warships are increasingly less likely to be destroyed during exploration of new starsystems.
  - ✓ The Klingons would not have survived the encounter with the First Federation (ST:OS, “The Corbomite Maneuver”); they would have, as Lt. Bailey suggested, opened fire on the First Federation Flagship Fesarius. Klingon pride would not have accepted Balok’s xenophobic threats and overbearing bullying – because they are bullies too.
- Punk Wood: It is possible, by activation of the Combat Power for the purpose of Combat Movement, to send Log Ships to an unexplored system, either with or without escorting warships. For all Hazard Rolls, *Log Ships are the same as Scouts*, but a lot more expensive.
  - ✓ The alternative would have been to state that Log Ships may never be sent to an unexplored destination system. However, given their purpose in the game (see Logistical Support Ships, 3 Movement, p. 860 and Combat Resupply, 4 Movement, p. 868, *supra*), and that they need to be able to move with warships using Combat Movement (see Move Out!, 1 Combat, p. 942, *infra*), this would have been an artificial restriction meaning that warships doing exploration would need to go unsupported, forcing the position to spend another Combat Movement later to send the Log Ships to rendezvous with the warship after the system is explored (or bring the warship home).

*“We live on an island surrounded by a sea of ignorance. As our island of knowledge grows, so does the shore of our ignorance.”*

– John Archibald Wheeler, *Scientific American*, 1992, Vol. 267

**Cooper:** *You sent people out there looking for a new home?*

**Prof. Brand:** *The Lazarus missions.*

**Cooper:** *That sounds cheerful.*

**Prof. Brand:** *Lazarus came back from the dead.*

**Cooper:** *Sure, but he had to die in the first place.*

– *Interstellar* (2014)

**Colonization:** Suppose the leaders of an island village are looking for resources,<sup>2</sup> so they send a young person in a boat out to an island that can only barely be seen on a distant horizon from coastal fishing outriggers on very clear summer days. The young person arrives and sees arable land for farming, clean running streams, and trees that bear fruit and lumber. The scout also sees that no one else is living on the island, and eagerly rows back home to tell his tale. The elders are delighted, but the next problem is, how can they obtain the resources of the new island and bring them back for the people of their village? That would mean sending a working party to the island to harvest resources and bring them back to the village. Or it might mean splitting the village and sending part to the next , or moving the entire village to the next island. Either way, colonizing the next island is going to be a lot more complicated than sending a scout.

- ✓ For an interesting case study in European colonization and trade, look up the Darien Scheme (1698-1700), Scotland’s belated attempt at colonization and England’s and Spain’s machinations to block it.<sup>3</sup> The Scheme cost Scotland (at that time, still a sovereign nation technically, but ruled by the King of England who was also King of Scotland) nearly 1/3 of its total national wealth and a significant number of its youth and tradesmen (about 2,000). The catastrophe likely contributed to the Acts of Union (1707) ten years later with payment of £398,085 10s sterling to Scotland to stabilize their economy and a fixed value for the shilling in relation to English currency.
- **Sardine Tins:** Colony Ships are the only ships that may Load and Transport population factors, the Colony Transport is the 1<sup>st</sup> Era Colony Ship. Population from any Friendly, Naturalized, or Converted colony (or Orbital City) owned by the ship’s owner, may be loaded onto Colony Ships if the ships began the Regular Turn at the location of the colony and the Expansion Power has been activated for the purpose of Loading Population. Uprooting a population from a planet (or Orbital City) and placing them on Colony Ships (or Orbital Cities) is a Herculean logistical task. Because of the vagaries of how much time is represented by a turn, how much population is represented by a population factor, politics, economics, and so forth (and the fact that some of the population might not want to be moved), a Loading Roll must be made for each population factor sought to be moved to Colony Ships or Orbital City in a Regular Turn.
  - ✓ Prior to attempting to Load the first population factor, a check must be made to see if the Expansion Power Activation for the purpose of Loading Populations is obeyed

(pursuant to Power Off, 2 Constructural Elements, p. 193, *supra*). *For this check only*, the status of the Constructural Elements on the origin colony are used, *no second check* is made for the Colony Ship(s); if the Power Activation is obeyed at the colony, Loading attempts may commence:

- The base chance of the first population being successfully loaded to a Colony Ship is 85%, and 5% is thereafter subtracted for each population that has been successfully loaded to Colony Ships at that location in the same Regular Turn.
- Positions may continue to load one population factor at a time during the same Regular Turn until a Loading Roll fails after which no more population may be transferred to Colony Ships at that location that turn. A Loading process can fail (15% chance) with no populations loaded.
- On Naturalized Colonies, the base chance is 75%, and on Converted or Conquered Colonies, the base chance is 65% with decreasing chances of success as described above. Population may never be Loaded from a Conquered Colony to Colony Ships *unless* the Conquered Colony is also Looted in the same turn (see Looting, 3 Commerce, p. 1210, *infra*).
  - See Colony Politics, 2 Order, p. 538, *supra*, regarding Colony Political Status; Political Status is the determining factor in Loading population to Colony Ships representing in this case incentives, trust, willingness (and desperation) of population.
- Loading Rolls are *location specific* to the colony and not the ships. Thus, when Loading Rolls have failed at the colony, the ships may not each attempt to Load more population. Application of Enlightenment (marketing, carrot & stick, propaganda...) to Loading Rolls depends on the status of the colony's Epistemological Constructural Element (see Skool Tyme, 2 Constructural Elements, p. 190, *supra*) and not those on any ship.
  - Failure of a Loading Roll may be interpreted as failure of political will, technical failure, refusal, resistance or reluctance of the population to be moved, ideological problems, or that time ran out in the current turn.
- A single Colony Ship or Orbital City may not contain population factors of different native population types due to environmental differences. This may, of course, eventually be overcome by technology developed during the game, but this is the baseline rule.
- Population successfully Loaded to Colony Ships will be placed on one Colony Ship until it is full, and then further successful Load Rolls will place population on the next available Colony Ship and so on. The Load Rolls *automatically fail* when the receiving Colony Ship(s) (or Orbital City) cannot accept more population (i.e. are full).
  - A Colony Transport can hold 3 population factors and an Orbital City can hold 15 population factors.

- The base chances described are just for game mechanical purposes, they have no realistic basis. The Concierge may alter the base chances; for example, evacuation of desperate populations from a doomed world.<sup>4</sup>

Loading population from a Balkanized planet with a non-sovereign **alien colony** may cause **apostasy** on the Colony Ship, see *Alieny Apostasy*, 3 Disruption, p. 283, *supra*.

Page | 913

- ✓ It is possible to fully evacuate, especially small colonies via Load Population. There are about a dozen ‘cat islands’ in Japan that had a population of 1,000 or less before WWII, who were either force-evacuated to the mainland for labor or migrated away after the war. Felines now outnumber humans on the islands by 10 to 1 and the remaining population is mostly elderly and declining. Caretakers and tourist feed them.
- **Colonies in a Can:** Population will remain on the Colony Ships until they are Landed or Unloaded; they will not grow if a Census occurs while the population is on the Colony Ships and will not produce resources during Taxation. In addition to being in population limbo, unarmed Colony Transports are extremely vulnerable in combat (they may never be armed or attack), and Colony Ships must obey all of the other rules concerning ships, including Operational Flight and Operational Supply Limitations (OSL/OFL).
  - ✓ “Eat recycled food for a happier healthier life, be kind and peaceful to each other, eat recycled food. Recycled food is good for the environment, and ok for you.” – food service drone, Judge Dredd (1995).

Population located on Colony Ships that are destroyed by any means are also lost. It is permissible to emergency Unload the population back onto the same colony that Loaded them, but this would be a monumental waste of previously-committed resources and time, and require another activation of the Expansion Power for the purpose of Unloading Population, and is generally counterproductive. Populations from Converted Colonies placed on Colony Ships **will not** automatically revert if not accompanied by a warship.

- ✓ See 3 Movement, pp. 855-856, *supra*, regarding OFL/OSL; Log Ships cannot supply Colony Ships. The underlying assumption is that populations on Colony Ships may exist indefinitely while located at a supporting colony either because a) they are frozen or in stasis, or b) their reproduction is limited to the space on the ships and they produce only what they need to survive, and have no growth or excess for taxation as a result. This is a necessary extension of the technological assumptions underlying the GGDM setting.
- ✓ Unfortunately, tuna cans and other cans that humans use, look like cat food cans to my cats. I wonder what your Colony Transports may look like to some predatory alien species? Sardine tins?
- **Canned Food:** Departure of Colony Ships from a system requires an activation of the Expansion Power for the purpose of Transport Population:
  - 1) A Scene is required on the star of the destination star system,
  - 2) This in turn, requires that the destination system be currently located on the position’s Public Space, and if the destination system has not yet been colonized, that would require that at least one ship be currently located in the destination system to place hold

the target/destination star on the Public Space (see On the Soapbox, 3 The Sidereal Stage, p. 122, *supra*),

- 3) This in turn, requires that the destination system has been successfully explored (pp. 907-909, *ut supra*), in order to have a guide ship waiting in the system.

Colony Ships may not depart for any system where *any* colony owned by the Colony Ships' owner is currently Besieged (see Besieged Colonies, 3 The Sidereal Stage, p. 124, *supra*).<sup>5</sup> If a sovereign colony becomes Besieged while the Colony Ships are *en route*, there is no effect, except that they may need to run a Blockade upon arrival (see Blockade Running, 4 Commerce, p. 1233, *infra*) because they cannot be resupplied or Unloaded. The conditions precedent only apply to movement by Transport Population at the time it is initiated. If the destination system is removed from the Public Space or a colony becomes Besieged before arrival of the Colony Ships, they will still arrive (which will return the system to the Public Space).

Page | 914

- ✓ Colony Ships have their own Constructural Elements status, received at the time they were constructed (see Maiden Voyage, 3 Construction, p. 677, *supra*) independent of the Constructural Elements status of the population Loaded to them.
- ✓ For the purpose of determining whether each Colony Ship obeys the Expansion Power Activation for the purpose of Transport Population, the Constructural Elements of each ship are used in individual checks. If the Colony Ships are still at a Supporting Colony and fail to obey the Power Activation, a second check is made using the Supporting Colony's Constructural Elements in the same manner as described in Engines Offline, 1 Movement, p. 839, *supra*, for Movement Power Activations to see if the Supporting Colony gives them a good 'ol kick in the can (jump or die!).

There are thus two activation purposes of the Expansion Power that initiate interstellar flight: Scouting for Scout Ships (*ut supra*) and Transport Population for Colony Ships. Movement, Expansion, Combat, and Commerce are the four Powers (not to be confused with the Four Powers of the Cold War☺) whose activations initiate interstellar flight.

- Opening the Can Of...: The Unload Population activation of the Expansion Power, removes population from Colony Ships onto an existing colony (or eligible Orbital City) of their Native Population Type. Hence, there must be an existing colony.... (not the same as Landing).
  - ✓ Prior to the first population factor being Unloaded, a check is made to see if the receiving colony (*optionally*, an exception could be Low Population Colonies) and each ship involved obeys the Power Activation. These checks are made separately based on each's current Constructural Elements. If the Colony fails to obey the Power Activation no population may be unloaded to the colony and the other checks are unnecessary. If the colony obeys the Power Activation then each ship involved makes an individual check and those that obey commence downloading (note that this is different than Loading, where only the colony is checked, *ut supra*, p. 912).
  - ✓ Colonist may not be Unloaded onto a planet surface if the existing colony is at its Maximum Habitability unless there is room in Orbital Cities, and colonist Unloaded onto a planet assume the political status of the colony to which they are added.
  - ✓ Like Loading Population onto Colony Ships, there are equally problematical logistical issues in offloading population to an existing colony, for example, where will they

- live, what will they do, integrating the newcomers into the social, political and economic framework of the existing colony, inflation, prejudice, exploitation, District 9. At the least, they must have a way to live and survive.
- ✓ Despite the possible integration problems described previously, population Unloaded to an existing colony have no distinction in GGDM, are not separate in any calculation, and adopt the status of the Constructural Elements of the colony, for better or worse.
    - This is purely a concession to game convenience; for story purposes, the integration can be played out in News Events and Interventions. It may also be possible to ‘backdoor’ Cohering in this way by Unloading ‘refugee’ population from other colonies with poor Constructural Element status to colonies with better status. The ‘cohering cost’ is simply shifted to the Expansion activations, any gain would be minimal.
  - ✓ Therefore, an Unloading Roll must be made for each population factor sought to be transferred to the new colony. The Unloading Roll operates the same as the Loading Roll; that is, if the Unloading Roll fails, no additional populations may be Unloaded to the colony (or Orbital City) during that Regular Turn.
  - ✓ Unloading Population is also considered *location specific* to the colony and follows all the same rules as described previously for Load Population procedures, including application of Enlightenment for failed Power Activation checks or Unload Rolls.
  - ✓ Colony Ships are not ‘consumed’ (*unlike* Landing, see Pandorum, 4 Expansion, p. 923, *infra*) by Unloading Populations, they are simply emptied (like an unloaded Cargo Ship or Logistics Ship) and can continue operating.
    - There is an operational triangle here: Loading population from planet to Colony Ship or Orbital City, unloading population from Colony Ship to Orbital City or planet, loading or unloading population from Orbital City to Colony Ship or planet. All are governed by the same procedures.

The Unload Population activation may be used to transfer populations from Colony Ships to existing Orbital Cities (or from Orbital Cities to the planet surface) that are either empty or have the same Native Population Type. See Orbital City Existential Patent and Dayworld, 3 Taxation & Census, p. 315 and Orbital City, 2 Construction, p. 667, *supra*.

- ✓ Yes, it is possible to backdoor the Colony Naturalization rules (see Naturalization, 3 Order, p. 557, *supra*) in this way by moving populations from Converted Colonies to Naturalized Colonies. However, the cost in RPs, Acts, and Scenes, Power Activations, disruption checks (see The New Neighbors, 2 Disruption, p. 273, *supra*) and time expended probably would not make it cheaper or easier in most cases. Further, this is a situation ripe for handy Concierge Interventions, as the previous converted population might act as agitators, troublemakers, or become resentful.
- ...Vienna Sausages: In addition to the problems of moving populations, there is also an economic cost in the form of *disruption checks*, lost production, and the actual cost of the operations. Each Load or Unload roll costs 2 RPs (you knew it was going to cost RPs!☺), regardless of success or failure, and counts against the colony’s GDP limit for the Regular Turn (see Gross Domestic Product, 1 Construction, p. 662, *supra*). A colony may not exceed its

GDP, nor may the Treasury be exceeded, with the cost of Load and Unload Rolls. Thus, the Loading or Unloading process may also be stopped, without a failure result, by reaching the GDP turn limitations or by running out of RPs in the Treasury.

- ✓ Note that in any situation there can be only one failed roll, so that minimum cost of any Load or Unload activation is 2 RPs. The number of success rolls however, is variable with the maximum possible being a highly improbable 16 consecutive success rolls (see also Improbables discussion, 4 Colleges, p. 506, *supra*), costing 32 RPs, at a Friendly Colony with at least 16 population and sufficient GDP. Use of Enlightenment to reroll failed die rolls could inadvertently lead to costing more RPs!

Adding or subtracting population from a Friendly or Naturalized colony is a Disruption Event, triggering Disruption Checks on the colony (see Highschool Friends and The New Neighbors, 2 Disruptions, pp. 272-273, *supra*). It's a bit of a gray area, but moving populations to and from Orbital Cities is probably not a Disruption Event, as they have not been added to or subtracted from the colony as a whole.

- ✓ Finally, pursuant to Alieneity Apostasy, 3 Disruptions, p. 283, *supra*, Unloading Population – even to an Orbital City – at a Balkanized planet with a non-sovereign **alien colony** requires an **apostasy** check.

The processing sequence of Power Activations is important to managing the Treasury each Regular Turn, see Clockwork Universe, 3 The Streams of Time, p. 90, *supra*. Loading/Unloading Population costs one Act and one Scene, see Colonization, 1 Expansion, p. 876, *supra*.

---

*“Our planet is a lonely speck in the great enveloping cosmic dark. In our obscurity, in all this vastness, there is no hint that help will come from elsewhere to save us from ourselves.”*

– Carl Sagan, [Pale Blue Dot: A Vision of the Human Future in Space](#) (1994)

---

**Desperation:** These two examples provide both a historical ‘real world’ example regarding loading rolls and difficulty of moving population over distances, and story material for Concierge use of Interventions. The process should in no way be considered smooth and reliable unless very special abilities or circumstances have developed. Mic drop.

- [La Bestia](#): “They gathered at dawn in this railyard in southern Mexico, contemplating their next move: catching a ride on the roof of La Bestia (the Beast) – the name migrants use for the notorious freight train that winds its way through Mexico toward the United States. ... He had heard about the dangers: the criminal mobs that terrorize travelers, the risk of falling and losing an arm or leg, or worse. Mexican police recently reported that ‘delinquents’ tossed several migrants from La Bestia in the state of Veracruz, leaving one dead and two with severed limbs.

But the train has reemerged in recent weeks as a preferred mode of travel for Central American migrants after the Mexican government, under pressure from the Trump administration, started making it more difficult for them to cross Mexico on their way to the U.S. border. ...

An assemblage of young men with sticks served as an ersatz security squad. Exhausted families gathered on scattered railway ties and a graffiti-splashed platform, waiting for the train to come to a halt. Women cradled infants in their arms.

Soon, many scrambled across the tracks into open boxcars, which were coated inside with cement dust, a remnant of the previous cargo. Women and children entered first. The men placed wooden ties and stones by the doors to keep them ajar. All were elated to be on their way, finally.

But then railroad security men decked out in black arrived and chased them away. They sealed the boxcars, warning of the danger of suffocation should the doors slam shut.

Now, the only option was to ride on top of the train, a death-defying endeavor. La Bestia is renowned for sharp curves and sudden braking, capable of sending rooftop passengers flying onto the rails. Low-lying branches can suddenly sweep riders off. There is no relief from the sun, rain or evening chill.

Reaching the top was itself a challenge. A gap of about 6 feet separated the top rungs of the ladders built into the boxcar exteriors and the roofs.

Daylight had broken. The yellow locomotive was running its engine. Some families had already formed human chains to mount the cars.

Abruptly, Galo and his group decided it was a go: Men clambered first to the top. Migrants standing beside the tracks or poised atop metal couplers between the cars tossed backpacks and plastic bags filled with clothes, water and food to comrades above. Galo and other men lay flat on their stomachs atop the boxcars, straining to extend arms to grasp women and children who were passed up, fire-brigade style. Children screamed. People shouted instructions, often contradictory or unintelligible in the cacophony. ...

Galo and the others used yellow plastic rope to help secure children and luggage atop the cars. Finally, La Bestia began lurching north, its rooftop stowaways flashing smiles of relief. Ahead lay a voyage teeming with peril, but also the hope of fresh beginnings.” – Patrick J. McDonnell, “Despite perils, more U.S.-bound migrants are turning to ‘La Bestia’ to cross Mexico,” Los Angeles Times, June 2, 2019.

- The Carricks of Whitehaven: “In March of 1847, nearly 200 people crammed inside a small, two-masted ship called the Carricks of Whitehaven, which was bound from Sligo, northwest Ireland, to Quebec City in Canada. Many were women or children. Some were sick with typhus, cholera or dysentery.

All of them were probably starving.

They were tenant farmers who had tilled the fields of Henry John Temple, known as Lord Palmerston, then the foreign secretary and the future prime minister of Britain, according to a forthcoming documentary called ‘Lost Children of the Carricks.’

Palmerston was one of the most powerful men in the U.K., with 20,000 acres and over 14,000 tenants, according to the film’s website. But even he had been affected by the potato blight that had begun to devastate Ireland two years earlier. As the crops withered and his tenants stopped paying rent, Palmerston evicted them but, unlike some other landlords, put them on boats bound for North America.

When the Carricks pulled out of Sligo harbor, it was one of hundreds of ships bound for Quebec from Ireland in ‘Black ’47,’ the peak of the Great Famine. Roughly a million people would flee the island during the Great Hunger, as it was also called. Another million would

die of disease or starvation. Between death and emigration, a quarter of Ireland's 8 million inhabitants would vanish over the course of just four years.

But a spot on a brig to North America was not sure salvation. The same diseases that had torn through famine-weakened Ireland followed the migrants onto the ship. So many died on the journey that the boats became known as 'coffin ships.'

Even if migrants escaped disease, there was also a good chance that their ship would never make it to North America. Of the nearly 400 ships that sailed toward Quebec in 1847 – most of them filled with Irish – 1 in 5 never made it, according to the *Globe and Mail*.

By April 28, 1847, the Carricks had been at sea for a month. But just as the ship neared the Cap-des-Rosiers – named after the wild rosebushes that covered its green hills and white-faced cliffs – a storm struck.

'The vessel encountered a strong gale ... and was driven, about two o'clock the next morning, on a dangerous shoal about sixty miles east of [Cap-des-Rosiers] and went to pieces in the course of two hours,' according to the British magazine *John Bull*, cited in the *Globe and Mail*.

Of the nearly 200 people onboard, only 48 survived, according to 'Lost Children of the Carricks.'" – Michael Miller, "A storm exposed children's bones on a Canadian beach, reviving a 170-year-old mystery," *The Washington Post*, June 17, 2019.

---

*"Six sets of environmental variables affected the outcome of Polynesian development: island climate, geological type, marine resources, area, terrain fragmentation, and isolation. Climate in Polynesia varies from tropical to subantarctic, with some of the highest rainfall in certain areas, and near-arid climates on others. Geologically, island types range from small coral atolls and raised limestone islands with thin soil and no permanent fresh water, to geographically diverse islands like New Zealand, with iron, coal, gold, and jade. Marine resources vary from abundant reefs and lagoons, to rocky coasts and steeply dropping ocean bottoms.*

*As to area, some islands are only 100 acres, while others are 103,000 square miles. The habitable terrain of these islands ranges from fragmented valleys and ridges to rolling hills and plains. Finally, some islands are so remote that they developed in isolation for hundreds of years, while others were in more or less regular contact with other islands.... Thus, Polynesian societies differed greatly from one another, and did so in a relatively short time and from a common human ancestor."*

– Jared Diamond, Summary of [Guns, Germs, and Steel](#), pp. 8-9, Kindle Edition

## Endnotes.

<sup>1</sup> Commentary & Citation: To not mince words, I believe that Gene Roddenberry would be ill if he saw the 2015 21-minute proof-of-concept video "Prelude to Axanar" (on YouTube, for a crowd-funded, fan-made film) but Norman Spinrad would not be surprised at all. Although the video pays brief homage (about 10 seconds) to the original concept of Starfleet (saying something like, 'we didn't join Starfleet to fight a war'), clearly war sells movies and Axanar is Star Trek's version of a Battle of Midway or Battle of Cannae (see *In Open Space*, 7 Combat, p. 1036,

*infra*); the current drift of Star Trek has become slick, militant space-opera video franchise for a new generation. The Prelude video again features an arms race of starship design, with the Federation building its first true warships and testing them in battle against the Klingons.

- ✓ “‘Star Trek’ as a concept has voyaged far beyond science fiction and into the safe waters of space opera, but that doesn’t amaze me. The Gene Roddenberry years, when stories might play with questions of science, ideals or philosophy, have been replaced by stories reduced to loud and colorful action. Like so many franchises, it’s more concerned with repeating a successful formula than going boldly where no ‘Star Trek’ has gone before. ... I understand the Star Trek science has never been intended as plausible. I understand this is not science fiction but an Ark movie using a starship. I understand that the character types are as familiar as your favorite slippers. But the franchise has become much of a muchness. The new movie essentially intends to reboot the franchise with younger characters and carry on as before. The movie deals with narrative housekeeping. Perhaps the next one will engage these characters in a more challenging and devious story, one more about testing their personalities than re-establishing them. In the meantime, you want space opera, you got it.” – Roger Ebert review of Star Trek 2009, May 6, 2009 (3 out of 5 stars).
- ✓ Of the two movies, the “Prelude to Axanar” (2014) on YouTube demonstrates more play with ideals and engages the characters in a more challenging and devious story than Star Trek 2009. But it’s still far away.

<sup>2</sup> Citation: Stanley Kubrick, speaking about the title of 2001: A Space Odyssey said, “[i]t occurred to us that for the Greeks the vast stretches of the sea must have had the same sort of mystery and remoteness that space has for our generation.” – Jerome Agel, The Making of Kubrick’s 2001 (1970). See also ocean discussion, 2 Movement, EN 1, p. 852, *supra*.

<sup>3</sup> Commentary: The Darien Scheme presents a mostly unexploited opportunity for great fiction, it could be used as a starting point for occult, horror, alternate history, fantasy, romance, adventure, or historical drama.

<sup>4</sup> Citation & Commentary: “The story begins in a future world where global temperatures have risen so high that in most of the world it is unsafe to be outside without special cooling gear during daylight hours. In a desperate bid to preserve humanity and ease population burdens on Earth, the UN has initiated a ‘draft’ for colonizing the nearby planets, where conditions are so horrific and primitive that the unwilling colonists have fallen prey to a form of escapism involving the use of an illegal drug (Can-D) in concert with ‘layouts.’ Layouts are physical props intended to simulate a sort of alternate reality where life is easier than either the grim existence of the colonists in their marginal off-world colonies, or even Earth, where global warming has progressed to the point that Antarctica is prime vacation resort territory. The illegal drug Can-D allows people to ‘share’ their experience of the ‘Perky Pat’ (the name of the main female character in the simulated world) layouts. This ‘sharing’ has caused a pseudo-religious cult or series of cults to grow up around the layouts and the use of the drug. Up to the point where the novel begins, New York City-based Perky Pat (or P.P.) Layouts, Inc., has held a monopoly on this product, as well as on the illegal trade in the drug Can-D which makes the shared hallucinations possible.” – from Wikipedia article, “The Three Stigmata of Palmer Eldritch,” captured February 12, 2019.

- ✓ The Three Stigmata of Palmer Eldritch is a 1965 book by Philip K. Dick, where psychedelic drug culture meets global warming/climate change. Note then that global warming was a concept before I was born, and well before the millennia when it became a political denial hot-button (see previous Air that I Choke discussion 3 Taxation & Census, p. 318, *supra*). Dick’s book was contemporaneous with another book where psychedelic drugs met far-future starfaring civilization, Frank Herbert’s Dune (1965). Both predate virtual reality and if written today, would probably include instead a virtual reality, such as Ready Player One (2011), where a virtual reality world substitutes for widespread psychedelic drugs.
  - Dune is, in fact, an entire interstellar civilization built on drug addicts, where drug addiction passed from being a purely mental state to the ability to affect living organic and inorganic reality.

<sup>5</sup> Commentary: Canned food is what the Magog (Andromeda TV series) call all other starships and space stations! Magog is a biblical word for the prophetic enemies of the people of God in the end of days. In the Andromeda TV series, the Magog were minions of the Abyss and contributed to the downfall of the Systems Commonwealth.

<sup>6</sup> Citation: See also, Minimum Viable Population and Inbred Population, 4 Taxation & Census, p. 329-330, *supra*, for similarities in Caribbean island culture. This is fodder for Interventions.

*See Appendix EXP – Expansion & Colonization Example*  
*See Appendix T&C – Taxation & Census Example*

*“How would an interstellar civilization set out to explore its neighboring star systems? It might establish staging posts, colonies, on planets of nearby stars. But this would take time. Time to find and modify favorable planets. Time to build new spacecraft. Eventually, later generations of explorers would set out wending their way among the worlds creating an interstellar nervous system binding up the stars. Perhaps they’d come upon another expanding civilization and encounter beings previously known only from their radio transmissions. Star wars are unlikely. One civilization certainly would be far more advanced than the other. It would be no contest.*

*Perhaps they would cooperate exploring together a small province of the Milky Way. But even nearby civilizations could spend millions of years roving between the stars without ever stumbling upon our obscure solar system. In a galaxy of 400 billion suns perhaps no one has found us just yet. Advanced interstellar civilizations would know about many worlds. Some inhabited, some barren. Perhaps they would share their findings assembling some vast repository of the knowledge of countless worlds. They might compile an Encyclopedia Galactica.” – Carl Sagan, Cosmos, Episode 12<sup>1</sup>*

**Dust Notes:** Most fiction about early interstellar colonization envisions a Polynesian-like situation of scattered small colonies separated by vast tracts of space and time between contacts. There is no reason to think this vision of diaspora is wrong.<sup>2</sup> Cultural conformity and political unity are the casualties of time and distance; thus, most science-fiction writers take the interstellar setting as a liberal opportunity to air their social grievances and philosophical visions.

- ✓ “...the volume of all biospheres is miniscule compared to the volume of the universe.”  
– Matt O’Dowd (City University of New York), “Are You a Boltzmann Brain,” PBS Space Time Channel, April 26, 2017.

**The Landing:** Landing is the process of using Colony Transports to establish a new colony<sup>3</sup> on an uncolonized planet, only Colony Transports can Land to establish new colonies in the early game. An ‘uncolonized planet’ is a planet without a colony of the Native Population Type that is on the Colony Ships, it does not mean *no colonies*. As noted in 3 Taxation & Census and 2 Order, *supra*, ‘Balkanized’ planets are possible where different Native Population Types may co-exist on the same planet. Colony Ships are never required to Land by being located in a system where there is a colonizable planet, but may be forced to Land due to OSL. A Scene must be on the star of the system where the Landing is to occur (see Colonization, 1 Expansion, pp. 876-877, *supra*) or no Landing can be made (*ut infra*, p. 922) because of bureaucratic indecision.

- ✓ The Controlled Environment Technology (CET) Existential Patent is required to Land on any Unpleasant, Hostile or Uninhabitable Planet.
- **Spiffy Spaceman:** You know that Spaceman Spiff is always crash landing his flying saucer on remote alien planets, right? Maybe he needs to become a Spiffy Spaceman instead! If he is not more careful, the Yukbarfs might reverse engineer his flying saucer from the wreckage.

Colony Ships that have expired OSL and CET will never refuse to obey a Power Activation to Land on an uncolonized planet *as long as they can legally do so* (i.e. it is not a Maximum Habitability); if they have expired OSL but not CET, they will never refuse to obey an Expansion Power Activation to Land on an uncolonized planet that does not require CET to colonize. This will frequently be the case when it is time to Land if you wait long enough...

If the above conditions do not apply, each Colony Ship designated to Land must check to see if it obeys the Expansion Power Activation to Land (see Power Off, 2 Constructural Elements, p. 193, *supra*). If the Colony Ships are in the same system with a supporting colony (i.e. colonizing another planet in the system) and they fail to obey the Power Activation, a second check is made by the Supporting Colony as described in Engines Offline, 1 Movement, p. 839, *supra*. Of course, if at least one Colony Ship Lands, it establishes a Supporting Colony for the other Colony Ships that didn't Land (whether they weren't ordered to or refused) and thus the other Colony Ships *cannot* thereafter Land (as there is now a colony on the planet) but can Unload Population or move away. As there are no die rolls involved in Landing, Enlightenment cannot and need not be applied, except to Power Activation failures.

- ✓ *Terra nullius* is the underlying assumption of GGDM, and science-fiction trope, regarding the initial colonization of planets by the Major Races. This may even be true if the planet is the home of a Minor Race (such as in the movie Avatar (2009)); all of the alien invaders of Earth seem to have regarded Earth as *terra nullius* (in the tradition of European colonization). See also the Outer Space Treaty of 1967.
- Island Notes: There can be only one colony of each Native Population Type per planet, see Lebensraum, 3 Taxation & Census, p. 321, *supra*. All populations of the same Native Population Type Landed (or subsequently Unloaded) on the same planet *form one colony* for game purposes. A colonized Planet must be placed on each colony owner's Public Space adjacent to either the star to which the colony's planet belongs or another planet in the same system. Planets do not need to be laid in Orbit Number order. While Stars may come and go from the Public Space as exploration moves outward, once a planet is colonized, it and its star will remain on the Public Space until the colony is destroyed, captured, or moved, plan accordingly.
  - ✓ The day Mars became a place on our Public Space:
    - “The cameras on each [Viking] lander revealed a kind of rocky desert. Beyond the lander itself, we saw for the first time, the landscape of the red planet. It didn't look like an alien world. There were rocks, sand dunes and gently rolling hills, as natural and familiar as any landscape on Earth. Forever after, Mars would be a place.” – Carl Sagan, Cosmos, Episode 5.
- Lines of Communication: All colonies must be connected on the Public Space by a Pathway to at least one Government Title at all times (see The Claaaw is Our Master, 2 Government Titles, p. 597, *supra*). A new colony requires the immediate establishment of a legal Pathway. The new colony begins with the active Constructural Elements of the population that formed the colony.
  - ✓ I found it richly amusing that they kept repeating in almost every episode, like a mantra, of Stargate Universe (2009-2011) that ‘these are all the wrong people’ referring to the approximately 80 refugees onboard the Ancient starship Destiny. Yet those were the ‘right people’ to be on Project Icarus, located on a distant planet, who arrived by starship and were beamed down (as that particular Stargate could only dial out)?
- Prison or Paradise?: Population on a new colony will retain the political status of their origin planet. If Colony Ships from multiple origins are Landed at the same time, the lower political status will prevail. A new colony established with Converted populations will revert if not guarded by a warship (they will not revert while on Colony Ships, *ut supra*).

- ✓ Colonization using convicts and prisoners is not a myth. The British were particularly notorious in this respect, shortly after the American Revolution they were shipping convicts to colonize Australia. The First Fleet consisted of six convict ships guarded by two Royal Navy ships that left England in 1787 and arrived months later at the Botany Bay colony in January 1788. The female convict ship HMS *Lady Juliana* – loaded with prostitutes and women convicted of petty theft, along with their children, sent to ‘civilize’ the Botany Bay colony arrived in 1789 (with numerous females plying their trade at ports along the way) and was unwelcome because the colony was starving and had not received resupply. The infamous Second Fleet was another group of six ships carrying over 1000 male convicts, 40% of whom died *en route* or shortly after arriving in Australia in 1790. They were equally unwelcome due to the lack of skilled labor in the new colonists. The Third Fleet with eleven ships brought 2000 more male and female convicts, plus a few notables and skilled workers, *and provisions* in 1791. Despite the voyages and initial hardships, eventually the convicts found life in Australia a liberation from the oppressive morals and class system of England.
  - It is certainly not improbable that the drive to colonize Australia was a result of having lost the 13 Colonies less than a decade before....
- ✓ “Beginning in the early 17<sup>th</sup> century, the City of London shipped their unwanted excess population, including vagrant children, to the American colonies – especially the Colony of Virginia, the Province of Maryland, and the Province of Pennsylvania – where they became not apprentices, as the children had been told, but indentured servants, especially working in the fields. Even before the beginning of the Atlantic slave trade brought Africans to the British colonies in 1619, this influx of ‘transported’ English, Welsh, Scots, and Irish was a crucial part of the American workforce. The Virginia Company also imported boatloads of poor women to be sold as brides.

The numbers of these *all-but-slaves* was significant: by the middle of the 17<sup>th</sup> century, at a time when the population of Virginia was 11,000, only 300 were Africans, who were outnumbered by British, Irish and Scots indentured servants. In New England, one-fifth of the Puritans were indentured servants. More indentured servants were sent to the colonies as a result of insurrections in Ireland. Oliver Cromwell sent hundreds of Irish Catholics to British North America during the Irish Confederate Wars (1641-1653). In 1717, the Parliament of Great Britain passed the Transportation Act, which allowed for the penal transportation of tens of thousands of convicts to North America, in order to alleviate overcrowding in British prisons. By the time penal transportation ceased during the American Revolutionary War (1775-1783), some 50,000 people had been transported to the New World under the law. *When the American market closed to them, the convicts were then sent to Australia.* In total, 300,000 to 400,000 people were shipped to the North American colonies as unfree laborers, between 1/2 and 2/3 of all white immigrants.” – from Wikipedia article, *White Trash*,” captured April 5, 2020 (emphasis added).

- A single ship in GGDM can be said to represent a *capability* rather than a singular game unit. Thus a ship in the game may represent a fleet, and the three fleets plus colonization of Australia might be represented by Landing

a single Colony Ship on a new planet with the rest being storytelling in News Events and Interventions by the Concierge. The entire population shifting system of GGDM – like most parts – should be considered a ‘smear’ analogous to the previously discussed quantum imagery – being both literal-of-the-moment and historically figurative in extended time.

- Survival & Ethical Dilemmas: There is no way to prevent Colony Ships from Landing on a planet which already has colonies (causing a Forced Balkanization Disruption Event on the **alien colony**, see 2 Disruption, p. 273, *supra*)<sup>4</sup> – or on any planet – unless they are destroyed before the Landing<sup>5</sup> or unless the planet is at Maximum Habitability. Of course, this rule does not account for technologies that may develop during the course of the game. Populations may not be Landed on Unpleasant or Hostile Class Planets without Controlled Environment Technology. Colony Ships that are in an unsupported system will perish if their Operational Supply Limitation (OSL) has expired, they have failed their Supply Roll (see 3 Movement, *supra*) and they cannot Land. This may even justify Scene Snitching, see 3 The Side-real Stage, p. 124, *supra*, if someone else has placed a Scene on the star.

- ✓ “A thousand people in an iron box. No food, no water. After a month we ate the weak. You know what I hate about myself? I know what people tastes like....I know that babies taste best.” – Curtis Everett, *Snowpiercer* (2014).

What is the difference between Mr. Wilford’s Train and a Colony Transport? Colony Ships are not made to convert to Orbital Cities if they cannot Land (for one thing, Orbital Cities are much bigger) and thus may not become Orbital Cities under the baseline rules of GGDM if they cannot Land or Unload. That does not mean that versatility technology cannot be developed in the game that would allow advanced Colony Ships to both act as Colony Ships and become Orbital Cities, for example, using Tender Ships to insert Colony System Boats as mobile Orbital Cities.

- ✓ While forced Balkanization from Landing will not cause **apostasy**, as explained in 3 Disruption, p. 283, *supra*, subsequent Loading or Unloading of *anything* might.
  - ✓ In late 2017, it was determined and/or announced in the media that there is a cave on the moon large enough to house a future colony; how exactly this is to be done or why or when we will get there is an unresolved matter. But this is an example – and a striking literary image – of how colonization of hostile environment worlds might actually occur; having mastered the Earth (and significantly damaged it in the process), humanity’s possible first foray to colonizing the solar system returns us to being cave dwellers on the shore of the cosmic ocean.
- Pandorum: Colony Transports (CTs) are consumed (‘scrapped’/‘cannibalized’) by Landing populations to establish a new colony.

There are any number of possible reasons for this, but the most reasonable would be that either the Colony Transports literally landed and cannot take off once on the surface, or that the CTs were cannibalized to provide materials for the colony. Colony Transports that only Load, Transport, and Unload Population at established colonies are not consumed (see *Opening the Can Of...*, 3 Expansion, pp. 914, *supra*). In this, they are really acting like transports.

Consumption of Colony Ships during Landing applies only to Colony Transports, see Colony Transport Existential Patent. It is possible to develop Colony Ships that are not consumed by Landing through later Patents.

- ✓ Landing Colony Transports in GGDM feels sort of like Marvin the Martian's 'instant Martians' from the bubble-gum machine (aka gumball machine) – just add water and poof, an obedient green colony pops up. Within the time scales and abilities of GGDM civilizations, that would be the appearance of it.
- ✓ Pandorum is a fictional deep-space psychosis that is the name of a 2009 movie. The production company went bankrupt right after the film bombed at the box office.

---

*“For the natives, they are neere all dead of Small poxe, so as the Lord hathe cleared our title to what we possess.”*

– John Winthrop, first Governor of Massachusetts Bay Colony, Quoted in Alfred W. Crosby, Ecological Imperialism: The Biological Expansion of Europe, 900-1900 (1986), p. 208

---

*“The seams of Pangaea were closing, drawn together by the sailmaker’s needle. Chickens met kiwis, cattle met kangaroos, Irish met potatoes, Comanches met horses, Incas met smallpox – all for the first time.”*

– Alfred W. Crosby, Ecological Imperialism: The Biological Expansion of Europe, 900-1900 (1986), p. 131 <sup>6</sup>

---

**Bad Exchanges:** Balkanization of planets *bypasses* the troublesome issue of xeno-microbes. The inadvertent exchange of microbes is no small matter; the Aztec Empire was ravaged by smallpox – one of the few diseases that modern medicine has rendered ‘extinct’ in the wild – (samples are kept in Atlanta and Moscow) leaving their capital vulnerable to conquest by the tiny Spanish expeditionary force and local tribal allies. Had the Aztecs understood smallpox as a virus, *what could they have done after the Spanish were already there?*

This is a possible point of Intervention by the Concierge based on judgment of technologies and habitats on the planet; e.g., if the planet is Hostile to all colonists, and each colony lives in a dome, there probably is minimal risk of contamination. This should also be kept in mind when contacting Minor races, during First Contact, during Ground Combat (i.e. dead bodies and destruction), or when transporting alien populations. The issue of xeno-microbes is always hovering in the background of contact between species (or even human populations) and microbial life is always evolving, adapting (see feature quote, George Dvorsky, “Alarming Study Indicates Why Certain Bacteria Are More Resistant to Drugs in Space,” in 1 Expansion, p. 885, *supra*). H.G. Wells issued the first modern warning in the clever ending to War of the Worlds (1898).

- ✓ Other than the Black Death, people generally underappreciate the effect of epidemics on history, yet microbes (and biological warfare) is the one thing we still fear (as evidenced by zombie apocalypse movies). An epidemic may have ‘saved’ Athens from Spartan siege in 430 B.C., the epidemic was so potent that it killed half of the population of densely-packed Athens, and the Spartan army and their allies refused to come near the city. Conversely, this epidemic is also likely the cause of Athens’ ultimate

defeat (just as the Black Death severely crippled the Church, see 1 Disruption, p. 252, *supra*); the loss of manpower from the deaths, the toll on public morale, the financial losses, loss of skilled craftsmen and leadership (the general Pericles and his sons all died of the epidemic); Athens couldn't even hire mercenaries, who did not want to be near the city.<sup>7</sup>

It is possible that some sort of Columbian Exchange will occur in any situation involving Balkanization of a colony world, and especially invasive colonization of a Minor Race (or colonization of any world that has a biosphere). How many alien planets do you think the Earth ants invaded through Babylon 5 (see top feature quote in 1 Entropy, p. 214, *supra*) considering that most species in the program breathe the same air as we do? Of course, that is a matter where the participants will need to 'look' to determine if it is possible; it is equally possible, or even probably more likely in reality, that most species will not be environmentally compatible: If we ever met any Venusians, likely our ants wouldn't follow them home.

- ✓ Remember all those awful Venusian creature features? 20 Million Miles from Home (1957), Zontar (1966), It Conquered the World (1956)... Now you know what the native fish in the Great Lakes and Mississippi River think of the Asian Carp invasion.

While much of the history associated with the Columbian Exchange is just plain ugly – venereal diseases, trans-Atlantic slavery, piracy, tobacco, cultural obliteration and imperialism, invasive species – participants should remember that the term Columbian Exchange is a completely neutral term that describes a massive, global (not just Europe, Africa and North America) and *indifferent* historical process of 500 years that is no different, more or less brutal or beneficial, than the 500 years of the Great Migration that shaped Europe before the Middle Ages. Such movements are within the scale of GGDM play, to be introduced intentionally or unintentionally.

---

*"It's not going to do any good to land on Mars if we're stupid."* – Ray Bradbury

---

**Noosphere:** Landing colonies on lifeless planets adds a *noosphere* to a planet that does not have a biosphere. Landing colonies on planets that already have a biosphere, may add to, intrude upon, disrupt, or destroy – depending on how profoundly these concepts are applied – an existing *noosphere*. In noosphere theory, the line between geosphere and biosphere is fairly stark, while the line – if such exists – between biosphere and noosphere is fuzzy and implies an emergence.

**Specialized Colonies:** All colonies, unless otherwise designated, are considered to be basic colonies (i.e. 'general colonies'), self-sufficient generally, and representing a general cross-section of the population of that type (both genetics and sociocultural classes), carrying on all of the culture and general functions of civilization in that place. It is possible to create Specialized Colonies (or 'special purpose colonies') to perform specialized functions in a manner superior to that of a general colony. Science-fiction literature and movies are full of 'prison colonies' (e.g., *Dune*'s Salusa Secundus), secret 'research colonies' (e.g., Traveller RPG's Research Station Omicron), 'mining colonies,' 'farming colonies,' military 'observation/listening posts/depots,' 'trading posts,' 'Foundation colonies' on the edge of the galaxy, and such other colorful places.

- ✓ Specialized Colonies not to be confused with *Special Planets* (see Resources from Special Planets, 2 Taxation & Census, p. 307, *supra*) are created by Special Writ similar to a Land Grant Writ (see Land Grant, 3 Colleges, p. 488, *supra*), which describes all of the advantages and disadvantages of a *type* of Specialized Colony and the Writ

would be activated in conjunction with either Landing a new colony or Loading Population to Colony Ships to send outward.

- ✓ It is probably *nearly* impossible to change an established general colony to a Specialized Colony – think of the retooling, reorganization, displacement of non-specialized population.
- ✓ A Specialized Colony may become a general colony by informing the Concierge of the revocation of the Specialized Colony status and Unloading enough population onto the colony to double the size of the colony.
- ✓ A colony cannot be both a general colony and a Specialized Colony, and a Specialized Colony cannot exist within or be hidden in a general colony.

This latter is a general rule for game sanity; if the participants want to engage in subterfuge, it may be possible to create Specialized Colonies within a general colony. As previously discussed, all of the population of one Native Population Type on a planet are considered to be one colony for game purposes, but an example of a Specialized Colony of the same Native Population Type might be ghettos or prison work camps, where minorities are reduced to near slavery. Even if there were an alien Specialized Colony hiding inside a general colony of another Native Population Type, it would still be a separate colony for game purposes, the only issue would be the concealment.

---

*“It struck me as I waited that all great enterprises are about logistics. Not genius or inspiration or flights of imagination, skill or cunning, but logistics. Building pyramids or landing spacecraft on Jupiter or invading whole continents or painting divine scenes over the roofs of chapels: logistics.”*

– Tom McCarthy, Remainder (2005)

---

**Magnitude of Mars:** A million humans consume three million pounds (1,500 tons) of food per day – and that’s being conservative.<sup>8</sup> Thus, military students learn the adage, ‘Amateurs talk about tactics, professionals talk logistics’ (think back to 3 Movement generally, *supra*). Learn the logistics. Work it out.<sup>9</sup> Logistics always kills brilliant plans, like paper always beats rock.

The current population of the world requires about 21 billion pounds of food per day;<sup>10</sup> some populations don’t have enough food, some populations waste food (and you know to which I refer), food distribution is not the least part equitable, but that figure is a good starting point for our planetary domestic subsistence. By extension then, it is not unimaginable that the world consumes around 100 billion pounds of materials and/or resources per day to maintain our global civilization.<sup>11</sup>

- ✓ “You’ve got simultaneous epidemics of obesity and starvation. Explain that one.” – Governor Nix, Tomorrowland (2015), see full speech, 3 Entropy, EN 4, p. 250, *supra*.

In the 21<sup>st</sup> Century, just having a sustainable colony of twenty people on the Moon would be an amazing accomplishment (at a ton of food per month, plus water, medicine, replacement parts, equipment, hygiene, fuel). We have managed to continuously keep a handful of people in low orbit for the last couple of decades – and that requires such significant expenditure that nations have turned to fledgling commercial space transport companies to make the required supply runs.

Even assuming for sake of argument that Mars is a nice place to live (which it isn't of course), imagine the effort and the capabilities that would be required just to move 1 million humans (a city) from Earth to live sustainably on Mars? Logistics is keeping us from manning Mars.

- ✓ "...because if the planet ever is terraformed, it will be done by human beings, whose permanent residence and planetary affiliation is Mars. The Martians will be us." – Carl Sagan, *Cosmos*, Episode 5.

Yet, certain abilities must be assumed for the sake of the game, therefore, the game is a balance between what must necessarily be assumed to be possible, while at the same time, bearing in mind the true magnitude of what is being assumed.

- ✓ Were the Romans or the Renaissance people to have imagined our world, they would have to imagine advances on a similar scale to be able to foresee our world. Of the two, only select Renaissance thinkers could have even begun to imagine – for example, Kepler's *Conversation with Galileo's Sidereal Messenger*.
- Soldier's Ration: Col. Trevor N. Dupuy, Curt Johnson, David L. Bongard, and Arnold C. Dupuy commented in How to Defeat Saddam Hussein (1991):
  - ✓ "Generally speaking, a man ate about three pounds of food per day (mostly bread and other grain products) and a horse needed ten pounds of grain and again that much grass, fodder, and silage. For a modest army of 20,000 men and 5,000 horses, this amounted to a daily consumption of 85 tons of edibles, including 50 tons for the horses. Along with the necessity of gathering fodder or finding pasturage for the horses, soldiers usually supplemented their grain or bread rations with meat, cheese, vegetables and fruit gathered on the march. ... Although soldiers commonly carried on their persons enough food for a few days (mostly flour or biscuit supplemented by beans or salt meat), horses generally depended on grazing from local pastures. For purely logistical reasons, an army had to find fresh sources of fodder regularly..." *Id.*, Appendix F, pp. 187-188.

The authors also point out tentage, wagons, replacement armor, weapons, and repair shops and other logistics that went along with just having food and fodder. Support of large forces such as those fielded by the Romans, Persians, speak of sophisticated and stable supply sources and logistics; in Medieval times, most battles were fought locally with only a few hundred men on a side. This discussion was of pre-gunpowder armies. The burden of logistics becomes exponentially greater each with the spread of gunpowder weapons, modern national conscription beginning in the 18<sup>th</sup> Century, and mechanization.

The daily ration of a French soldier in 1805 amounted to 48 ounces, or 3 pounds of food plus an ounce of brandy and a bottle of wine or beer. The munitions bread probably wasn't that tasty as a meal and it was most of what they received; the formal name soldiers gave it was *pain de munition* or "ammunition bread." Use your imagination. Still, it is clear that three pounds per day of food has long been the standard military field ration.

- ✓ "Hardships could not be blamed for such lapses, since an imperial order of May 14 fixed the daily ration of the soldier at 24 ounces of munition bread, 4 of soft bread, 16 of fresh meat, 4 of rice or dried vegetables, an ounce of brandy and a bottle of wine or beer." – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 522.

For the record, the metric system was not formally adopted by France until 1799 and was not compulsory until 1837, and was internationalized in 1870. Thus, the imperial order of May 14, 1805 referenced weights in the English system. See Russ Rowlett, “The Metric System,” <http://www.ibiblio.org/units/metric.html>, last revised April 27, 2018.

Soldiers have never appreciated field rations, the now ubiquitous Meal, Ready to Eat (“MRE”) was called by various names, including “Meal, Rejected by Everyone” when I served. The parts of the meals also had pet names, such as “beans and baby dicks” (I am not making this up) and the infamous “Wolf cookie” which you threw back over your shoulder for the wolves to eat after taking one bite.

Page | 928

- ✓ “Each meal provides about 1,200 calories (5,020.8 kJ). They are intended to be eaten for a maximum of 21 days (the assumption is that logistics units can provide fresh food rations by then), and have a minimum shelf life of three years (depending on storage conditions) ... Each MRE weighs 510 to 740 grams (18 to 26 oz.), depending on the menu. Since MREs contain water, they weigh more than freeze-dried meals providing equivalent calories.” – from Wikipedia article, “Meal, Ready to Eat,” captured August 8, 2019.

A person should be able to live on two MREs per day, but in extreme conditions such as cold, or high levels of activity, three MREs per day may be required.

---

*“The thing that makes me happy is that I know that on Mars, two hundred years from now, my books are going to be read. They’ll be up on dead Mars with no atmosphere. And late at night, with a flashlight, some little boy is going to peek under the covers and read The Martian Chronicles on Mars.”*

– Ray Bradbury

---

**Child Slave Colony on Mars:** “Yes. Someone has accused NASA of being ringleaders of a child slave colony on Mars. If you’re brain just melted and leaked out your ears leaving you in a catatonic state just from reading that last sentence, congrats, you’re not alone....

The idea that this conspiracy theory could even gain steam is one big advertisement for why we should just delete everything. That NASA had to spend one single second, had to expand the energy to simply pick up the phone and say no to this conspiracy theory is a good reason to shut down America for good this Fourth of July.” – Marcus Gilmer, “Of Course NASA isn’t running a child slave colony on Mars, you idiots,” Mashable, June 30, 2017.

- ✓ “On Thursday’s Infowars broadcast, Steele alleged the kidnapped children were not only being kidnapped for space labor, but also murdered for their blood and bone marrow.” – Ben Collins, The Daily Beast, June 30, 2017.
- ✓ “Jones spoke with Robert David Steele, who said the kidnapped children arrived on Mars after a 20-year journey through space... The two decades of travel would technically mean the hypothetical children were no longer children upon arrival, but regardless, the child slave colony is not real, so the math doesn’t really matter.” – Lauren Tousignant, “NASA Clarifies: We don’t have child sex slaves on Mars,” New York Post, June 30, 2017.

*“Mars ain’t the kind of place to raise the kids,  
in fact it’s cold as hell.  
And there’s no one there to raise them if you did...”*

– Elton John, “Rocket Man” (1972)

*“Mars has become a kind of mystic arena onto which we have projected our  
Earthly hopes and fears.” – Carl Sagan, Cosmos, Episode 5*

## Endnotes.

<sup>1</sup> Citation: See 1 Combat, p. 950, EN 13, *infra*, for discussion related to this Carl Sagan quote.

<sup>2</sup> Commentary & Citation: In May 2019, there were two sci-fi short films on YouTube called simply “The Emisary.” One was by Blue Ice Pictures, posted by BravoFact on December 6, 2017 (13 minutes) and the second was posted by Byran Tan (the producer/director) on March 29, 2019 (21 minutes, it even has an IMDB entry). The first involved the retrieval of a lost alien ruler from Earth, and the latter, reestablishing contact with humans who fled Earth a century previously due to tyranny, genocide and persecution. I liked both of them, despite the criticism of the second one as not being sufficiently science-fiction-like for some, and I recommend both to GGDM readers and participants. I also liked the two related CGI animated shorts, “Fortress” posted January 2015 (3 minutes) and “The Last Day of War” posted on June 24, 2016 (6 minutes) by Dima Fedotov (The CGBrothers, YouTube Channel).

- ✓ YouTube is loaded with sci-fi shorts – and I only watch them occasionally – it seems to have become the natural playground for aspiring auteurs (and an outlet for racists and conspiracy theory crackpots who would be met with opprobrium elsewhere, aspiring musicians, bits of dead television series and old movies, Hollywood movie trailers, science and history educators, etc.). DUST is very prolific with hundreds of sci-fi shorts, all very well done on their own channel; BravoFact focuses on Canadian productions, but not specifically sci-fi. Among these thousands of sci-fi shorts are probably endless circumstances, technologies, scenarios that might spark game-play ideas or story arcs for GGDM participants for in-game exploration.
  - I have no idea how these YouTube content producers make money on the sci-fi shorts, but I suppose there is a way. Bryan Tan claims to have built the set in his basement and his short contains only two amateur actors and a few outside scenes by a lake. But there is that issue again – monetization of ideas discussed previously in 3 The Big Bang – science-fiction content creators have made huge money from successful books and films, but science-fiction literature may still be one of the last remaining places where creative ideas have intrinsic value prior to monetization.

<sup>3</sup> Citation: “We do here settle and in the name of God establish ourselves; and in honour and for the memory of that most ancient and renowned name of our Mother Country, we do, and will from henceforward call this country by the name of Caledonia; and ourselves, successors, and associates, by the name of Caledonians.” – Dedication of New Caledonia colony (1698), from Wikipedia article, “Darian Scheme,” captured June 25, 2018.

- ✓ *365 years later*: “Tonight we stand beneath a new heaven. After 150 years of calling out, the silence of the universe assures us that life is unique. We are alone. You and I are among the first to bring life to the stars – to this planet. The farthest any human has ever ventured. I know there are those at home who say that we are here only as a status symbol. Others say that we are fortune hunters, or that we’re running away. But I know we’re here because of faith – faith in each other, in a better world. The rocket fuel that brought us here can be burnt away, but our belief in ourselves, in one another, in the future, never can be; never will be.” – Dedication of Vesta Colony, Epsilon Eridani (2063), Space Above & Beyond (aka SAAB) TV series, Pilot Episode (1995).

- Is the date chosen by the writers, 365 years after New Caledonia, a coincidence?

<sup>4</sup> Citation & Commentary: “People are not little stones, or keys in someone’s pocket, that can be moved from one place to another just like that.... Therefore, we cannot precisely arrange for only Serbs to stay in one part of the

country while removing others painlessly. I do not know how Mr. Krajišnik and Mr. Karadžić will explain that to the world. That is genocide.” – Colonel-General Ratko Mladić, 1992 comments reported in article by Edina Bećirević, “Bosnia’s ‘Accidental’ Genocide,” Bosnian Institute (UK), September 30, 2006.

- ✓ Didn’t happen in the New World either; pale alien invaders Landed, made colonies, forced the natives out of their lands. The only thing that could have stopped the Europeans from landing – the destruction of their ships or a credible threat thereof – did not exist for the Native Americans. You already know the history well. The Cossacks know the history well, too.

<sup>5</sup> Citation: Destruction of Colony Ships *before Landing* is a Disruption Event for the origin colony of the population, see Vesta and Tellus, 2 Disruption, p. 274, *supra*. There is some grey area in this, if the colony ships were in another system when destroyed, would we assume that the original colony would know of it? That depends on what is assumed in the setting and the circumstances, e.g., FTL communications. However, Regular Turns in GGDM can represent very long periods of time, and the truth does have a way of hitting home eventually.

<sup>6</sup> Citation: “Crosby was an inter-disciplinary researcher who combined the fields of history, geography, biology and medicine. Recognizing the majority of modern-day wealth is located in Europe and the Neo-Europes, Crosby set out to investigate what historical causes are behind the disparity, investigating the biological factors that contributed to the success of Europeans in their quest to conquer the world. One of the important themes of his work was how epidemics affected the history of mankind. As early as the 1970s, he was able to understand the impact of the 1918 flu pandemic on world history. ... In 1972 he created the term ‘Columbian Exchange’ in his book of the same name.” – from Wikipedia article, “Alfred W. Crosby,” captured August 8, 2019. (cf. Jared Diamond).

<sup>7</sup> Commentary: The entire Peloponnesian War is bracketed between two entropic events: the 464 B.C. earthquake in Sparta which started the revolt (it was a sign from the gods, it was now or never for the helot revolt) that soured relations between Sparta and Athens, and the 430 B.C. Plague of Athens, though it took yet another generation until Athens surrendered in 404 B.C. The entire Peloponnesian war is bracketed between two Concierge Interventions...

- ✓ The exact cause of the Plague of Athens is not known, but is now believed by many experts to be typhus or typhoid fever. The Mahdi in Sudan, Muhammad Ahmad, over 2,300 years later, died in 1885 of typhus. So that bit of epidemic history is not far behind us. Alternatively, the other possible culprit, “viral hemorrhagic fever” – known as Ebola virus, made the news in 2016 with an outbreak in West Africa.

<sup>8</sup> Commentary: This is what made the Berlin Airlift (1949) so impressive. In an attempt at securing currency hegemony, the Soviets blockaded all ground and rail supplies into West Berlin and cut off utilities. After discarding military options to resolve the blockade, Western leaders began a massive humanitarian airlift of supplies into the city that lasted over a year. The Soviets were then placed into a position of either occupying West Berlin with Soviet troops, or shooting down unarmed humanitarian cargo planes, or doing nothing. Unwilling to risk starting a war with NATO, the Soviets did nothing while the airlift kept the population of West Berlin supplied and eventually exceeded pre-blockade supply levels. With no credible argument left, the Soviets backed down. The West German deutschmark was issued and West Germany recovered and grew into an industrial power.

- ✓ On July 1, 1990, the East German “ostmark” was abolished, and the West German deutschmark became the official currency of a reunited Germany. The reunification of Germany proceeded like a hasty annexation of East Germany by West Germany.

<sup>9</sup> Commentary: One difficulty with the Taiping Rebellion are the claims of the sizes of the armies involved in the campaigns and battles. I do not doubt the claimed losses, the ferocity of the total war, and the social and population upheaval and destruction caused by the war, but the claims of armies of half a million or that a million combatants were involved in various battles, armies that were not possible generally before mechanization (and greatly exceeded even those claimed in antiquity) – and I have seen no reference to rail supply and really no discussion of how such armies were fed (though the British did destroy an enormous hidden Imperial supply depot, Great Hsi-Ku Arsenal, during the later Boxer Rebellion) that would substantiate the numbers claimed – is difficult to accept.

<sup>10</sup> Commentary: And generates at least that much sewage. Or put another way, if you buy cat food, you have to buy cat litter. Or let the cat out.

<sup>11</sup> Commentary: Lack of appreciation of scale is central to all human environmental problems; the ability to visualize the individual footprint multiplied by millions and billions per day, multiplied by a thousand years. This is central to all issues from local recycling and reuse programs to global warming and climate change dynamics.

## The Case for the Empire

**Leia Lies:** “The destruction of Alderaan is often cited as *ipso facto* proof of the Empire’s ‘evilness’ because it seems like mass murder – planeticide, even. As Tarkin prepares to fire the Death Star, Princess Leia implores him to spare the planet, saying, ‘Alderaan is peaceful. We have no weapons.’ Her plea is important, if true.

But the audience has no reason to believe that Leia is telling the truth. In Episode IV, every bit of information she gives the Empire is willfully untrue. In the opening, she tells Darth Vader that she is on a diplomatic mission of mercy, when in fact she is on a spy mission, trying to deliver schematics of the Death Star to the Rebel Alliance. When asked where the Alliance is headquartered, she lies again.

Leia’s lies are perfectly defensible – she thinks she’s serving the greater good – but they make her wholly unreliable on the question of whether or not Alderaan really is peaceful and defenseless. If anything, since Leia is a high-ranking member of the rebellion and the princess of Alderaan, it would be reasonable to suspect that Alderaan is a front for Rebel activity or at least home to many more spies and insurgents like Leia.

Whatever the case, the important thing to recognize is that the Empire is not committing random acts of terror. It is engaged in a fight for the survival of its regime against a violent group of rebels who are committed to its destruction.”

– **Jonathan V. Last, “The Case for the Empire,” Weekly Standard, Art. 2540, May 15, 2002**

**Luke is a Radicalized Insurgent:** “While some have put forth persuasive arguments as to why the Galactic Empire were actually the good guys and the Rebel Alliance bad, the recent online discussion tends to be on a more macro level, discussing galaxy wide events and surrounding the Empire’s struggle to restore safety and order to a star system overrun by space terrorists.

A more focused study, however, is needed to truly understand that the Star Wars films are actually the story of the radicalization of Luke Skywalker. From introducing him to us in *A New Hope* (as a simple farm boy gazing into the Tatooine sunset), to his eventual transformation into the radicalized insurgent of *Return of the Jedi* (as one who sets his own father’s corpse on fire and celebrates the successful bombing of the Death Star), each film in the original trilogy is another step in Luke’s descent into terrorism. By carefully looking for the same signs governments and scholars use to detect radicalization, we can witness Luke’s dark journey into religious fundamentalism and extremism happen before our very eyes.

When we first meet Luke Skywalker, he’s an orphaned farm boy with barely any friends, living with his Aunt and Uncle, and wanting to join the Galactic Academy like all the other guys his age. You see, Luke didn’t become a space terrorist overnight, but he did exhibit signs that would make him a prime candidate for terrorist recruiters. The process of radicalization, as described by Anthony Stahelski in the *Journal of Homeland Security*, notes terrorists tend to:

- Come from families where the father is absent (check)
- Have difficulty forming relationships outside the home (check)
- Be attracted to groups offering acceptance and comradeship (checkmate)

Luke is just the kind of isolated disaffected young man that terror recruiters seek out.

Obi Wan — a religious fanatic with a history of looking for young boys to recruit and teach an extreme interpretation of the Force — is practically salivating when he stumbles upon Luke, knowing he’s found a prime candidate for radicalization. Stahelski notes terror groups place a focus on depluralization, stripping away the recruit’s membership from all groups and isolating

them to increase their susceptibility to terrorist messaging. Within moments of meeting Luke, Obi-Wan tells Luke he must abandon his family and join him, going so far as telling a shocking lie that the Empire killed Luke's father, hoping to inspire Luke to a life of jihad.

Shocked and confused by this onslaught of terrorist brainwashing, Luke hurries home only to find the charred corpses of his aunt and uncle. The Empire's accidental harming of Luke's Aunt Beru and Uncle Owen can be directly compared to the casualties of President Obama's drone campaign, whose body count terrorists capitalize upon for recruitment. This is precisely what Obi-Wan does, preying upon Luke's emotional state to take him under his spell and towards a life of extremism.

Obi-Wan whisks Luke off to Mos Eisley using a Jedi mind trick to bypass security, knowing full well he likely appears on numerous terror no fly lists. After contracting a local drug smuggler for transportation, Obi-Wan and his newest Skywalker recruit are off. They are soon captured, however, and attempt an escape which culminates in a battle between Obi-Wan and Vader. During the fight, Obi-Wan notices Luke watching, and seeing an opportunity to fully inspire Luke to radicalize, says a Jedi prayer while committing suicide. Can you think of any other groups who try to inspire terrorism by yelling a prayer before a suicide attack?

Once Luke escapes and regroups with a terror sleeper cell, he joins them on an attack mission. As he nears his target, hearing Obi-Wan's words in his mind, Luke closes his eyes, says a prayer and bombs a space station, killing everyone aboard. Young Skywalker has proven himself a quick study in the ways of armed religious extremism."

**– Comfortably Smug, "The Radicalization of Luke Skywalker: A Jedi's Path to Jihad," Decider (decider.com), December 11, 2015**

**Just War:** "Let us accept arguendo, however, the claims of Princess Leia and her apologists that Alderaan was peaceful and had no military targets.

Even so, one could argue that the destruction of Alderaan was not inconsistent with just war theory. To be sure, many just war theorists claim that the tradition requires both discrimination between civilian and military targets and proportionality. Yet, as LTC Peter Farber, an instructor at the Academy, has written: 'there is no single, coherent just-war position. Rather, there are clusters of ideas that have waxed and waned through time, and they have not evolved into a transhistorical system of simple moral rules.' Hence, as Farber notes, theorists long defended strategic bombing within the just war tradition:

.. 1) it preserved and protected the just against the criminal (note the Augustinian emphasis here), 2) the civilians supporting their national leadership were equally responsible for the decisions made by that leadership, and 3) the vigorous prosecution of the war prevented an even greater loss of human life

While the destruction of Alderaan may be regrettable, it seems clearly defensible under this understanding of the ethics of strategic warfare. Indeed, as Tarkin noted, the very purpose of destroying Alderaan is to end the war more quickly. Hence, just as was the case with strategic bombing in earlier times, 'the vigorous prosecution of the war' could be justified as an effort to prevent 'an even greater loss of human life.'"

**– Prof. Steven Bainbridge (UCLA School of Law), "Was the Alderaan Incident Consistent with Just War Theory," Steven Bainbridge's Journal of Law, Politics and Culture (blog [www.professorbainbridge.com](http://www.professorbainbridge.com)), June 6, 2005**

**Stephen:** *Did you ever play tic-tac-toe?*

**Jennifer:** *Yeah, of course.*

**Stephen:** *But you don't anymore.*

**Jennifer:** *No.*

**Stephen:** *Why?*

**Jennifer:** *Because it's a boring game. It's always a tie.*

**Stephen:** *Exactly. There's no way to win. The game itself is pointless! But back in the war room, they believe you can win a nuclear war.*

\*\*\*

[after running through all nuclear war scenarios]

**Joshua/WOPR:** *Greetings, Professor Falken.*

**Stephen Falken:** *Hello, Joshua.*

**Joshua/WOPR:** *A strange game. The only winning move is not to play. How about a nice game of chess?*

– Wargames (1983)

**Drama:** How farfetched did Wargames seem? The AI program Eurisko did essentially the same as Joshua (with considerably less over-dramatization) and crushed the Traveller Trillion Credit Squadron national tournament in 1981 and 1982, a year before Wargames (1983), see quote in Imperial Admiral Eurisko, 4 Colleges, pp. 512-513, *supra*. Able Archer exercise (November 7-11, 1983) later that year brought the world to the brink of nuclear war, a month after Soviet tracking systems mistook cloud reflections for a first strike ICBM launch by the U.S.

*“What am I supposed to do  
If I want to talk about peace and understanding  
But you only understand the language of the sword  
What if I want to make you understand that the  
path you chose leads to downfall  
But you only understand the language of the sword  
What if I want to tell you to leave me and my beloved ones in peace  
But you only understand the language of the sword  
I let the blade do the talking...  
So my tongue shall become iron  
And my words the mighty roar of war  
Revealing my divine anger's arrow shall strike*

\*\*\*

*Beloved brother enemy  
I sing my sword song for you  
The lullaby of obliteration  
So I can wake up with a smile  
And bliss in my heart...  
Coexistence, conflict, combat  
Devastation, regeneration, transformation  
That is the best I can do for you”*

– Heilung, “Kriegsgaldr” (2015)

**The Come As You Are Party:** GGDM doesn't have to be a wargame, players could agree on that, but here is the eternal conundrum: If you are going into the unknown, can you risk not bringing a weapon? As syfy.co.uk succinctly put it:

- ✓ “If Star Trek has taught us anything over the years, it's that pacifism, diplomacy and mutual understanding are the greatest weapons in any explorer's toolkit. But that doesn't mean you shouldn't also carry a phaser, just in case...” – “Ranked! Star Trek's 25 deadliest races, from the Romulans and Q to the Borg and Breen.”<sup>1</sup>
- ✓ See also related discussions of starships in *Starship Jefferson*, 1 Stardrive, p. 780, *supra*, and exploration with warships, *Send the Enterprise!*, 3 Expansion, p. 909, *supra*.

And if the other guy has a weapon, you must also have an equal or better weapon, and so it goes ever onward through history.<sup>2</sup> Call it a lack of faith in fellow humanity and the universe (see also alterity discussions in *Let it Bee*, 1 Diplomacy, p. 1105, and *Mephisto's Marriage Counseling*, 3 Diplomacy, p. 1135, *infra*).

- ✓ “So be it, threaten no more, to secure peace is to prepare for war!” – Metallica, “Don't Tread on Me” (1991).

The ultimate form of this argument played out across the last half of the 20<sup>th</sup> Century; the world's major powers had nuclear weapons because others had nuclear weapons, and when there were enough such weapons to destroy humanity and most life on Earth, the weapons became a very expensive and practically useless implement of power. Instead, they became an enduring risk-management, slippery-slope restraint on the Cold War struggle that prevented the outbreak of major conventional warfare among the major powers (Ozzy Osborne, “Thank god for the bomb...,” *ut infra*). The current world was instead shaped by proxy wars, clandestine operations.

- ✓ We never thought it likely that the Soviets could beat us in full conventional ASL battle, rather, we were concerned what would happen when they could not. Deterrence is a tricky thing, once it failed to dissuade the Soviets from starting WWII, our technological offset strategy and containment strategy would become a slippery slope liability increasing the probability of the use of chemical and nuclear weapons

The Come-as-You-Are Party is an obsolete type of casual party from the time of more formal public dress codes of the mid-20<sup>th</sup> Century; you wore to the party whatever you happened to be wearing the moment you received the invitation.

- ✓ “Old newsreels of people walking along in any downtown setting show men in fedoras, women in skirts and heels – absolutely no one would consider ratty jeans or drawstring pants acceptable out in public. Hence the guffaws when we would see one another in clothes old women used to say they ‘wouldn't wear to a dog fight.’ It wasn't that everyone was insanely vain, it was that they simply took pride in their appearance and in wearing what suited the occasion. It was a point of etiquette, compliance with the dress code.” – Joni Hilton, “The Ultimate ‘Come As You Are’ Party,” *Meridian Magazine*, June 13, 2010.<sup>3</sup>
- ✓ A comic I remember from my youth: A man is laying naked in bed with his mistress. She is on the phone. She turns to him and says, “Your wife just invited us to a come-as-you-are party.”

- Nuclear Paradox: It is both true that thermonuclear weapons are the most powerful weapons humans have ever had (and that nuclear weapons are the most powerful weapons ever used in war on Earth) and that they are the most useless weapons in the arsenals of modern nations.

I recall reading somewhere (and I cannot find it now) that in the early centuries of the last millennia, some theorized that if there were enough gunpowder in the national arsenals of the Earth, they could blow up and destroy the Earth in a simultaneous or chain reaction explosion. Such a thought seems rather quaint now, but the idea was there in the early days of the new warfare based on chemical explosives that human destructive potential with new technologies could ‘destroy’ the Earth. Five centuries later the thought resurfaced in the popular imagination as potential reality.

- ✓ “For peace and trust can win the day, despite all your losing.” – Led Zeppelin, “Immigrant Song” (1970).

France has nuclear weapons; arguably France is more powerful now (in terms of destructive abilities) than at any previous time in history. However, France has not been the aggressor in a continental European war since 1870 (though has had military adventures elsewhere), is a member of the EU and NATO making any future French aggressions unlikely, and no longer has even its own currency, the franc being retired in 2002 for EU notes. The increasing paradox of the modern world order is epitomized by France – the habitual aggressor of centuries – its expensive destructive forces are of limited use and the concept of national sovereignty is getting soft around the edges (like a cookie in milk). France is bound to Germany in the EU by their shared historical shame of the 19<sup>th</sup> and 20<sup>th</sup> centuries.

- ✓ “Both the rewards and penalties were fabulous. The most deadly weapon discovered since gunpowder, atomic energy was also the most wonderful new source of power since steam and electricity. Where gunpowder had never known more than a limited industrial use, atomic energy held forth the promise of operating ocean liners within a few years, or supplying heat for a city as large as Seattle.” – Lynn Montross, War Through the Ages (2<sup>nd</sup> Ed. (1946)), p. 952.
  - This text does not appear in the 3<sup>rd</sup> Edition published in 1960, whose end was extensively rewritten to cover the end of WWII, the beginning of the Cold War and the Korean War. Assuming that Lynn Montross did not live in an intellectual vacuum, this text is valuable as an artifact of the early Atomic Age intellectuals.
  - By 1960, the optimism of a brighter post-WWII world had faded to black. Thus, this text was written out of the 3<sup>rd</sup> Edition. There are still no nuclear powered ocean liners to my knowledge, but there were soon nuclear powered submarines (USS Nautilus, 1958) and aircraft carriers (USS Enterprise, 1962), that is, nuclear powered warships. No sober person was surprised.
- Humanity Cometh: Sovereignty is “the *monopoly of the legitimate use of physical force within a given territory*” (Max Weber). See *The Earthly Entanglement*, 2 Government Titles, p. 586, *supra*. The development of sovereignty in early human civilization is intricately and inseparably woven with tribal warriors, their leaders, and their religions and tales. At some point, police forces developed and diverged from warriors, so that each could do certain tasks better, but they share the same brew. Activation of the Combat Power in GGDM – and all

other activations in support of it, all around the circle of civilization – is the most basic expression of sovereignty, either to preserve or extend it.

*“Along with improved ease of use, the bow offered the advantage that the bulk of elastic energy is stored in the throwing device, rather than the projectile; arrow shafts can therefore be much smaller, and have looser tolerances for spring constant and weight distribution than atlatl darts. This allowed for more forgiving flint knapping: dart heads designed for a particular spear thrower tend to differ in mass by only a few percent.”*

– Wikipedia article, “Atlatl,” captured June 30, 2018

**Day Million:** Day Million will be about the 265<sup>th</sup> Day of the year 2739 C.E. or maybe it’s the 265<sup>th</sup> Day of 2738 B.C.E. depending on which direction you are counting? Between those dates are 2 million days of human history.

Probably the first weapon used in combat is the stone.

- ✓ Would it have made sense if the hominid waterhole fight scene in the opening of 2001: A Space Odyssey involved rock throwing instead of a club? Or in addition to the club? Chimps throw stones at trees.
- ✓ In 2016, wild Capuchin monkeys were observed chipping stone and creating sharp, jagged flakes, however, the monkeys were not using these to make tools, rather, they consumed the quartz dust created by the rock-hammering activity. Archeologists have long thought chipping stone was an early human toolmaking activity, associated with hunting cultures. Eva Botkin-Kowacki, “Monkeys are making stone tools thought to be unique to humans,” The Christian Science Monitor, October 19, 2016.

Our best guess is that the sling, made from the hides and/or insides of animals, which propelled the stone to previously heretofore unknown velocities, was invented around 30,000 B.C.

- ✓ In 1935, child actress Shirley Temple reputedly hit First Lady Eleanor Roosevelt sharply in the behind with a stone from a sling shot she hid in her purse while at a White House cookout with her mother.

At about the same time was invented the ingenious spear-thrower (or “Atlatl”) which was able to propel a spear with speed and accuracy. The Aztecs used atlatls against the Spanish. Iron Age Europeans added a strap to give the spear a spin and range. Both of these weapons were useful both for food procurement and fighting.

- ✓ Imagine the difference in the Anglo-Zulu wars if the Zulu army had major contingents of expert atlatls, slingers and bowman to follow behind and around the flanks of their frontal wave assaults against the English at Rourke’s Rift and other engagements? The English soldiers were not wearing any armor.

Approximately 10,000 years after the sling, someone had the idea of propelling a small spear with great speed and accuracy by use of a bowed piece of wood and a string, attached to both ends, pulled back to provide the force. We know that humans had the bow and arrow around 16,000 B.C. (or at least by the end of the last Ice Age, 10,000 B.C.<sup>4</sup>), the oldest evidence of archery, dated 13,000 years ago, was found in Hamburg, the oldest remnants of bows, dated 8,000

years ago, were found in Denmark and cave paintings found at Vilafranca, Castellón, Spain show humans hunting with bows. Ötzi the Iceman, the name given to the well-preserved remains of a 30-45 y/o male who died 5,100 to 5,400 years ago in Italy, was slain by an arrow in the back.

- ✓ This is not to suggest in any way that the Europeans invented the bow. An article in Smithsonian (Erin Wayman, “Early Bow and Arrows Offer Insight Into Origins of Human Intellect,” November 7, 2012) suggests that stone blades found in South Africa, dated to 71,000 years ago, *may be* early arrow heads or spear thrower points. The one-inch silcrete stone blades were heated over a fire and then chipped to sharp points. To be clear, however, no one has found any bows from that time nor are there cave paintings from the period in the area.

Long before the invention of the sling or the bow, or metals, by approximately 60,000 B.C. at least, humans began practicing ritualized burial of the deceased, with flowers, arrangements of objects, personal possessions of the deceased, and perhaps even an extraordinary organized Neanderthal family burial plot, found at La Ferrassie, France.

- ✓ “An important innovation of the Middle Paleolithic is deliberate burial, often with indications of funerary ritual. Deliberate burials are common, as we have seen, at La Chapelle, La Ferrassie, Shanidar, and Teshik-Tash, and there are many others. At Teshik-Tash, we find an interesting ring of goat horns surrounding a child’s grave, an arrangement that would certainly seem to indicate ritualism of some sort. Shanidar IV was buried with flowers, an act which may or may not suggest ritual, but which certainly does suggest a special attitude toward death. A remarkable burial occurs at the La Ferrassie rock shelter perhaps as much as 60,000 years ago. It looks like a family cemetery; the presumed parents are buried head to head and four children are interred neatly nearby. A short distance beyond, a small mound contains the bones of a newly born infant, and bit further under a triangular stone is the grave of a six year old child.” – Jurmain, Nelson & Turnbaugh, Understanding Physical Anthropology and Archeology, 3<sup>rd</sup> Ed., 1987, p. 437.

Contemplation of death, followed closely by hunting, seasons, and our own mortality, were probably the first catalyst for abstract thinking among our distant ancestors. Almost all of the paintings and objects found from that period relate to those four subjects. As of today, the meaning of death and our own mortality remain the major catalyst of abstract human thought, the first encounters with death and mortality remain the key events in every child’s life, and all abstract human thought, in all its forms, can be traced, in some winding way, ultimately to thoughts of death and mortality (and the passing of seasons).

Most or all of the weapons used in early warfare were either hunting or farming implements. It is probable that over a period of time, the development of the spear diverged into two classes of spears, the war spear and the lighter hunting/throwing spear. However, the true breakthrough in weaponry development came when someone introduced the *metal* club attached to a wooden or wood and leather wrapped handle. The metal club eventually developed a thrusting point like a spear, and flattened out across the middle, and developed one or two long sharp edges; alternatively, many argue the sword developed from the dagger. With the sword, a man could lop off the tip of his enemy’s spear and then close on his now helpless opponent, especially when the spearmen were huddled in close formation with little room to maneuver or escape.

The sword was introduced to warfare, around 2,000 B.C.;<sup>5</sup> the Assyrians also organized the first true ‘war-state’ with a top-heavy state and culture completely dedicated to war, conquest, and exploitation, and were probably the first to extensively use iron chariots. While one can hunt with a sword, the sword is not particularly good or efficient for hunting, fishing, or farming; the sword is a tool mainly efficient for one use: killing people. The sword, which became the universal symbol of military might and kings, was the first true weapon of war and represented a dedication to war. The sword became the symbol of war.

- ✓ Swords and ploughshares are well acquainted with each other, since Biblical times, ploughshares have been beaten into swords and swords have been turned into ploughshares. Metal can only take so much stress!

By approximately 2,000 A.D., humans were fighting vast interstellar wars with an amazing array of weapons and capabilities. We know from recovered films – a type of moving cave painting viewed against a wall in dark, enclosed places – that battles were fought at places such as Endor (in 1983), Proxima 3 and Coriana 6 (both in 1997), New Caprica (in 2006), Witchhead Nebula (in 2000), and Wolf 359 (in 1990) and of the adventures of the famed starship, *Galaxy Quest*. Curiously, the sword, most assuredly an anachronism by then, apparently continued in use, as shown in the films “Banner of the Stars” and “Crest of the Stars” found recently at an archeological excavation on Mars, and in the Star Wars historical documentaries found in The Satan Pit, where it had apparently developed into something called a “light saber” in which the metal of the original sword was replaced by a glowing, colored blade of light called “the force.”☺

- ✓ My attitude toward war, expressed through GGDM, is in *summus*, ‘it happens, it’s sad and devastating to generations, it is somehow necessary (just like stupid people, if it weren’t for stupid people, half of us wouldn’t have jobs) and much of the progress of civilization to this point has been the direct result of war, conflict, and migration in innumerable and emergent ways, even as we decry it, ‘change cannot occur without consequences.’ I think that my view, the sum of all of the debates and reading of my youth, and my military experience, is generally the same position as that of most of the late Cold War cohort. I see it reflected for example in the writings of Joseph Tainter (e.g., collapse of complex societies) and Edward Soja (e.g., spatial justice, the polis), who are both writing in their own way about conflict of civilizations.
- **Thank God for the Bomb:** Everyone has great ideas that if enough people listened to them, it would change the world. Hey, let’s make the world better by getting rid of nuclear weapons! It was the great cry of the Cold War. Are you sure? Was the world a better place before nuclear weapons? *Do you remember how we got there?*

Though it was not the main point of the story, the authors of “Duet” (Epic Illustrated, Vol. 1, No. 27, December 1984) understood that side consequence. In the story, aliens destroyed Mars as a demonstration of their power, and forced all of the Earth nations to get rid of their nuclear weapons without interfering otherwise (see Metalaw discussion, Mephisto’s Marriage Counseling, 3 Diplomacy, p. 1135, *infra*); at the end of the story, in a world free of nuclear weapons, the main character (a subway bum) was drafted into the military and sent off to fight in an oil war against the Soviet Union. Has the world been made demonstratively better by the ideas of Jesus, Confucius, Buddha, or Mohammed? The jury is hung. The best we can offer is that it is different than it was or would have been, but we are not sure how it would have been otherwise.

- ✓ “If that’s the only thing that’s stopping war, then thank god for the Bomb.” – Ozzy Osbourne, “Thank God for the Bomb” (1986).
  - The argument must have been out there in the late 70s probably, because “Duet” in Epic Illustrated – a story making a similar point – was published two years before Ozzy’s “Thank God for the Bomb.” Cognitive history.

Not all great ideas have this dramatic, intractable character. Quitting smoking on a personal level is a great idea that probably has few drawbacks in the long term. But the distinction must be made in legally banning sale, transport, possession, and manufacture of all tobacco products – there are reasons why it hasn’t happened beyond the tobacco lobby’s efforts – who might echo the question above: was the world a better place before tobacco?<sup>6</sup> Part of the problem is the history of the alcohol Prohibition (see Flying the Banner, 4 Government Titles, p. 632, *supra*) and part of the reason is that, compared to other problems, such as opioids and addiction to other recreational substances *that are actually illegal*, tobacco use is the lesser problem (the whac-a-mole problem, 4 Culture, p. 404, *supra*). So that war has been waged, somewhat successfully, by convincing individuals to stop smoking or never start, and by removing smoking from public buildings, but it’s a goal like zero inflation and zero unemployment – smoke free society will probably never happen.

---

*“‘Are we all crazy?’ the Agriculture Minister asked. ‘Do we think we can gamble with atomic arms like so many firecrackers?’”*

\*\*\*

*“‘Comrade Defense Minister, you have led us to the brink of destruction,’ Bromkovskiy said. ‘Now you wish us to leap in after you!’”*

– Tom Clancy, Red Storm Rising (1986)

---

**Little Willie Won’t Go Home:** When humans let the nuclear genie out of the bottle, we came close up against the mind-numbing scale of the universe; humans can no more *grok* the power of a nuclear weapon than the distance to Alpha Centauri. That genie will not go home.

- ✓ “The big bang, took and shook the world, Shot down the rising sun, The end was begun, it would hit everyone, When the chain reaction was done, The big shots, try to hold it back, Fools try to wish it away, The hopeful depend on a world without end, Whatever the hopeless may say.” – Rush, “Manhattan Project” (1985).

**Dawning of Horror:** The essence of the true nuclear war movie (e.g., The Day After (1983), Threads (1984), Testament (1983), By Dawn’s Early Light (1990)) is the psychological tension and helplessness of being caught up in a catastrophic runaway situation that we know is wrong and is madness, that we know we caused and could have avoided, like a disastrous high speed drunk driving, life altering car wreck stretched into slow motion over two hours (with thankful commercial breaks). I do not prefer to watch such movies now, because I know how they work, but I wish the younger generation would watch them (they won’t), as this is how the world of today was made by what didn’t happen in 1983.<sup>7</sup>

The cinematic treatment of global thermonuclear war is a history of the full horror of the concept dawning into the public consciousness. Compare the movie Atomic Attack (1954) to movies made 25 or 30 years later (e.g., The Day After, Threads, etc.). Atomic Attack (1954) is very naïve and is considered borderline whitewash propaganda in the early Cold War minimizing the

consequences of thermonuclear war (at a time when the U.S. government thought they were behind the Soviets in both the space race and nuclear missiles). Ten years later in movies such as *The Time Travelers* (1964) or *The Twilight Zone* episode “The Old Man in the Cave” (1963), nuclear apocalypse was referred to as devastating and catastrophic in a sort of distant past-tense manner, while by *Damnation Alley* (1977) and into the 1980s, global thermonuclear war had evolved in television movies into immediate personal horror in addition to being the end of civilization (infrastructure, civil authority) and possibly the end of humanity.

- ✓ The essence of the Cold War zeitgeist is the dawning realization that we were living on the edge of a manmade historical accident to tip us into the abyss. We still are. Nuclear weapons aside, do you think we can handle a global pandemic and/or rising seas from manmade climate change and massive coastal population displacement? In the Black Death people died so fast they could not bury or care for them properly.

The indie film *Day the World Ended* (1955, a year after *Atomic Attack*) is more ‘realistic’ but is mostly a creature feature resulting from nuclear war, while Stanley Kramer’s highly-praised film (even by scientists) *On the Beach* (1959) is a brutally grim and personal story about Australians and a U.S. Navy submarine crew in the aftermath of global thermonuclear war, foreshadowing the coming 1980s movies. *On the Beach* doesn’t show the actual nuclear war, but rather, the dread of spreading radiation and collapse of global civilization (foreshadowing *Mad Max*).

However, *On the Beach* (1959), the first realistic treatment of the subject, adds mass-suicide of surviving populations when the radiation reaches Australia.<sup>8</sup> The 1959 movie, listed on IMDB with a runtime of 2 hours and 14 minutes, was significant enough that it was remade into a well-received television mini-series with an added hour of runtime in 2000. That is, *after* the end of the Cold War, whereas other Cold War nuclear apocalypse movies have not been reprised as of 2019 – does anyone expect to see *Threads* or *The Day After* remade? Those were not bad movies, but the producers took a risk: 2000 (after the Y2K scare) was probably the last chance to get something like that on the screen without having to add future evil robots or an alien invasion.

- ✓ “There’s been a 70% radiation spillage factor at high altitudes across the equator. It’s coming south. I got the radio operator in Singapore, then she went home to die.” [The Captain asks how long they have?] “According to Australian naval command in Melbourne, a matter of months, Sir.” – *On the Beach* (remake, mini-series, 2000).<sup>9</sup>

Even the 1980s films never went so far as to mention or endorse government-sanctioned mass-suicide and rarely discussed the suicide in post-apocalyptic effects;<sup>10</sup> everyone was heroically supposed to be trying to survive and return to normalcy. I chuckle at the thought of the government of Australia in 1959 vehemently denying that it ever had such a plan – no warehouses full of suicide pills<sup>11</sup> – and pointing out that it was just a movie, that the movie makers had no special knowledge of government planning for global thermonuclear catastrophe. But under those circumstances, who knows what anyone would do in the aftermath of the ultimate absurdity?

- Enemy Mine: Suspicion of others is an act of projection and abstraction by sapient. In one sense, as when solving a crime or mystery, suspicion may be a projection or deduction from facts, but often lacking the final fact or proof necessary to identify the perpetrator or solve the mystery. In another, more common sense, it is a projection of what we would do if we were in the other’s position; the two senses are not the same, no one thinks that a detective who suspects a perpetrator, would do what the perp did in the same circumstances.

Yet the two senses come from the same process and involve facts, beliefs and emotions, both rational and irrational, and this is what is so confusing about our language and mental states. Would you do the same as a cow would do or do you think a cow would do the same thing you would do if given a chance?<sup>12</sup> It depends on the circumstances, sometimes humans and cows do the same (e.g., eat vegetation), but most of the time they don't (e.g., eat cows). In an interstellar setting would it be appropriate to suspect that sapient, technological aliens would do something because we would do the same?<sup>13</sup>

- ✓ The nuclear preparedness command post exercise called Able Archer in 1983 is a prime example. In principle, it probably sounded like a great multi-national exercise to align all of the NATO powers in the same procedures and to train top leaders in the decision-making process. Except that no one anticipated that the Soviets would see it as a ruse for a preemptive nuclear strike on the Soviet Union – probably because the Soviets thought that is *what they would do in our place*, they had probably contemplated that very ruse. As a result, the Soviet forces went to high alert, the period of September to November 1983 was the closest that the world came to nuclear war since the Cuban Missile Crisis of 1962. The Soviets realized later it was a training exercise, NATO realized how close they had come to a Soviet preemptive strike.
  - ✓ In the movie *Paths of Glory* (1957), General Georges Broulard assumed that Colonel Dax, a famous criminal defense attorney, defended the accused and exposed the incompetence and misdeeds of General Mireau in order to secure a promotion and take General Mireau's job. He assumed this was all part of Colonel Dax's ultimate plan *because that is what he would do*, and was stunned and unable to comprehend that Colonel Dax actually cared about his troops and the fate of the accused.
  - ✓ “We can't go on together, With suspicious minds (suspicious minds); And we can't build our dreams, On suspicious minds.” – Elvis Presley, “Suspicious Minds” (1969).
- Killer of Giants: Dehumanization in war – both of the enemy and of the combatants and civilians on both sides – is a well-known concept and staple of modern literature, documentaries, and frontline journalism.
- ✓ [Interview in German with English voice over translation] “The British were always astonished that we did not look different to them. This was the funniest thing about the whole situation. They said, for heaven's sake, you've all got English faces. Of course, what were we supposed to look like?” – Lt. Josef Klein, 3<sup>rd</sup> Paratroop Regiment, Monte Cassino: *The Soldier's Story* (documentary, 2018).
  - ✓ [Interview in German with English voice over translation] “I think that the war in the south against the English and the American units was, I would say, not really hate. He was the enemy. Everyone had to do their duty. He was on his side of the front, we were on our side. And I think the suffering was the same. Because of the very strange situation in this part of the battlefield, we had somehow the feeling they [the English soldiers] were like comrades because they went through the same things.” – Pvt. Rudolf Valentin, 3<sup>rd</sup> Paratroop Regiment. *Id.*
  - ✓ [Interview] [background scene, enemy soldiers exchanging cigarettes during an armistice to collect the wounded] “Part of the whole curious experience of being in combat was that you could have an intimate relationship with your enemies under certain circumstances, and there is another time you could quite cheerfully shoot them. It

was a conundrum because the human side kept coming through.” – Maj. Dennis Beckett, 1<sup>st</sup>/4<sup>th</sup> Essex Battalion. *Id.*

What could be easier to ‘dehumanize’ than extraterrestrials, especially if they pose an existential threat? The standard science-fiction solution is to ‘humanize’ them through the story, to make the audience recognize the aliens as mortal and moral persons, e.g., *Enemy Mine* (1985) a box office bomb (which I think I saw first at the Camp Foster theatre in Okinawa in 1987) is such a movie (a sci-fi remake of *Hell In the Pacific* (1968), a previous box office bomb<sup>14</sup>) that went on to become a major box office success in the former Soviet Union (according to Wikipedia). See further discussion in *Alien Persons*, 2 Diplomacy, p. 1110, *infra*.

- ✓ “If none of us believe in war, then tell me what the weapons’ for?” – Ozzy Osbourne, “Killer of Giants” (1986).
- ✓ “Mother please forgive them, for they know not what they do ... I had a vision, I saw the world burn, and the seas had turned red; the sky had fallen, the final curtain, in the land of the dead.” – Ozzy Osbourne, “Revelations (Mother Earth)” (1980).

---

*“The wealth and scientific ingenuity of our civilization was being squandered on a runaway arms race. [The nuclear powers] employed half the world scientists and infested the world with 50,000 nuclear weapons.”*

– Ann Druyan, introduction to the Collector’s Edition of *Cosmos* <sup>15</sup>

---

*“The nuclear arms race is like two sworn enemies standing waist deep in gasoline, one with three matches, the other with five.”* – Carl Sagan <sup>16</sup>

---

**Evolutionary Arms Race:** However, Douglas Adams described evolution as an arms race:

- ✓ “For example the race between the Amazonian manatee and a particular type of reed that it eats. The more of the reed the manatee eats, the more the reed develops silica in its cells to attack the teeth of the manatee and the more silica in the reed, the more manatee’s teeth get bigger and stronger. One side does one thing and the other counters it. As we know, throughout evolution and history arms races are something that drive evolution in the most powerful ways and in the world of ideas you can see similar kinds of things happening.” – Douglas Adams, “Is there an Artificial God?” speech at Digital Biota 2, Cambridge U.K., September 1998.

So was (is) the arms race part of human evolution or a sad parody of evolution?

---

*[Interview] “We were turning out bombs by the thousands. The United States by the height of the Cold War had some 40,000 hydrogen, uranium and plutonium weapons in its storehouses and the Soviet Union which always cranked out more than it needed, had some 75,000, enough to destroy the world many times over. I’m happy to say that we are now down to about a total in the world of about 13,000 [in 2015], still enough to destroy the world many times over, but not as many times as in the 1980s.”*

– Richard Rhodes (author of [The Making of the Atomic Bomb](#) (1986)), *The Half-Life of Genius: Physicist Raemer Schreiber* (2018)

---

**The Combat Power:** The Combat Power may be activated for the following four purposes:

1. Combat Movement,
2. Initiate Combat,
3. Combat Alert,
4. Seize Initiative.

The general purpose of activating the Combat Power is to *initiate combat* which are represented by the first three purposes of the Combat Power Activation, above. Activation of the Combat Power for the purpose of Combat Movement requires two Acts and one Scene which must be placed on the *star* on the Public Space where the movement begins. Activation of the Combat Power for the purpose of Initiate Combat or Combat Alert requires one Act and one Scene on the *star* of the system. Activation of the Combat Power for the purpose of Seize the Initiative requires one Scene on the *star* of the system where the combat is ongoing.

- ✓ It would be problematic to require the attacker to have a Scene on the target planet of a Colony or drop-in Ground Combat to Initiate Combat, esp. after a Short Movement.
- ✓ Units involved in an ongoing combat *cannot do anything* during the Regular Turns (will not obey Power Activations) until they either retreat or the combat ends.

**Warships:** A warship is defined in GGDM as a starship or system boat capable of initiating offensive combat in either system space or in orbital space over a planet (but not at FTL or in interstellar space; Colony Combat against Ground Bases is initiated from orbit). Specifically, they include Era Warships (see 2 Combat, p. 951, *infra*), Carrier Ships (see 1 Carriers & Fighters, p. 1049, *infra*) and armed system boats, with or without a Tender starship to transport them. See System Boats, 3 Construction, p. 677, A Hot Dinner, 3 Movement, p. 863, *supra* and Carrier Operations, 1 Carriers & Fighters, p. 1050, *infra*, for discussion of Tender starships.

- ✓ Colony-based Fighter Complements effectively make the colony an armed system boat for the purposes of *initiating offensive combat*.

A Log Ship is not a warship (at least initially) and thus must be addressed separately in the Combat Movement rules below. Carrier starships are capable of initiating combat without a Fighter Component (i.e. Carrier direct fire) and are thus a warship, Fighter Components, whether on a Carrier or Colony, can initiate combat but are not starships (at least initially). This is a bright dividing line in GGDM: Each ship or boat (unit) is either capable of initiating combat or not, there is no middle space, thus is a warship defined; conversely, all Defense Bases are not capable of initiating combat, such that the inability to initiate combat (as well as the inability to initiate movement, at least initially) is congruent with the definition of a Defense Base.

Tender starships – which may or may not be offensively armed, should be considered warships if they are transporting armed system boats – what Traveller RPG called Battle Riders – which may initiate combat upon arrival. Otherwise, the GGDM rules provide no means by which a military Tender can move to a system and deploy the system boats to initiate combat on arrival.

- ✓ Tender Ships violate the Law of Excluded Middle (or Third) in the GGDM rules as they fit neither the definition of a warship (*ut supra*) nor are they Log Ships, but must be able to initiate Combat Movement if carrying armed system boats.

Alternatively, Tender starships could function as Log Ships beyond the normal OSL, for their system boats (a system that would need one or more successful Patents) making them Log Ships for the purpose of Combat Movement (*ut infra*). See A Hot Dinner, 3 Movement, p. 863, *supra*.

- ✓ “Not in the mood? Moods are things for cattle and love play, not fighting!” – Gurney Halleck, *Dune* (1984).

---

*“The English-speaking peoples took no joy in finding themselves the most powerful military force on earth in the autumn of 1945. Comprising only a fraction of the globe’s inhabitants, they had built up armies, navies and air fleets more mighty than all the others. Had they been obsessed with a lust for conquest in 1945, it is a fair speculation that they possessed the means. Far from having any such ambition, both Britain and the United States were uneasy under the new burden of responsibility. The awful secret of Hiroshima weighed heavily, for the public did not need to be reminded that today’s military asset might become tomorrow’s liability. Any citizen able to add two and two could perceive that the atomic bomb, plus jet and rocket propulsion, added up to future long-distance missiles which could conceivably shatter or even conquer a strong nation in a few hours.”*

– Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 964

---

**World Conquest:** What a striking thought, given the conditions of the world in August 1945.<sup>17</sup> Though it would have been fanciful to think that the Allies could have pushed the Russians out of Germany and Poland in 1945 (i.e. Operation Unthinkable), the rest of the world was wide open, the Soviets had no comparable naval forces and neither did anyone else. How many peoples have turned their back on such an opportunity for conquest? What do you think the Romans would have done? Why Not? The difference is clearly in the comparison of the sociopolitical culture of the two times, the two civilizations. The question is, is the ‘pass’ of 1945 a sign of human maturation, or just circumstances at play?

---

*“Never, never, never believe any war will be smooth and easy, or that anyone who embarks on the strange voyage can measure the tides and hurricanes he will encounter. The statesman who yields to war fever must realize that once the signal is given, he is no longer the master of policy but the slave of unforeseeable and uncontrollable events.”* – Winston Churchill

---

**Move Out!:** Combat Movement is the special movement for:

- 1) Warships and/or Log Ships,
- 2) When moving from any system to any destination system that does not currently have a supporting colony,<sup>18</sup> **and/or**
- 3) Where the warship’s owner desires to initiate combat upon arrival.

Activation of the Combat Power for the purpose of Combat Movement allows as many warships and/or Log Ships to depart from the origin system to any and as many destination systems – either unsupported (condition 2, above) or supported (condition 3 includes movement to a supported system) – as desired. Combat Movement is required when sending warships and/or Log Ships to an unexplored system (see Send the Enterprise!, 3 Expansion, p. 909, *supra*) or when sending Log Ships by themselves to an unsupported system (conditions 1) and 2) above).

There are only two conditions precedent necessary for Combat Movement, the “and/or” means that either **(1 and 2)** apply or **(1 and 3)** apply. Those two sets cover all possible situations for moving warships. Obviously, 3 can never apply to Log Ships moving by themselves.

- ✓ Whenever the Combat Power is activated for the purpose of Combat Movement, each ship designated must be checked to see if they obey the Combat Power activation. Like Movement (see Engines Offline, 1 Movement, p. 839, *supra*), if there is a supporting colony in the system, a *second check* is made for any ship that failed to obey the Power Activation. Any ship that fails to obey the Power Activation will be left behind. Enlightenment could be applied to these obedience rolls if the target unit (or Supporting Colony) has an active Epistemological Constructural Element (see Skool Tyme, 2 Constructural Elements, p. 190, *supra*).

If warships or Log Ships are moving to a system with a supporting colony, and do not intend to initiate combat upon arrival, they can and should use the Movement Power instead, which only costs one Act and one Scene (see Ad Astra, 1 Movement, p. 839, *supra*). If they are moving to a destination system with a supporting colony and intend or anticipate engaging in combat upon arrival, they must use the Combat Movement activation. There is no requirement that the anticipated enemy forces, or any enemy forces, be present in the destination system, or known, when Combat Movement is initiated; such Combat Movements may be precautionary.

- Space!: Space is very big in a three-dimensional absolutely-cold vacuum way. This leads to four basic principles of space combat. First, no one can be forced to initiate combat. Second, except when defending planets or any other important point in space, no one can be forced to defend in a combat (because space is big and three dimensional). Third, combat only occurs in starsystems, combat does not occur between ships traveling at FTL speeds between stars (or wherever they happen to be while moving between stars). And last, no one can be barred from entering a starsystem, the only way to stop someone from entering a starsystem or doing anything is to destroy them or provide a credible threat of destruction.
  - ✓ Ships *en route* will arrive in the star system at the end of their flight, see The FTL Missile, 2 Movement, p. 849, *supra*, that is, in GGDM, ships are assumed to be incapable of avoiding arrival in the destination starsystem once interstellar movement commences. Thus, the owner would need to be dissuaded from initiating the interstellar movement. Just as the only way for a bug to avoid being eaten by a bird is to not be present at that time and place. Bugs have no other defenses against birds.
- Attack!: Combat Movement only gives the moving warships the option of initiating combat upon arrival at the destination; the warships are never *required* to initiate combat upon arrival and Combat is never automatically initiated. Warships arriving in a system via Combat Movement, may either initiate a Ship Combat against any opposing ships (of any type) currently in the system, or if there are no opposing warships present (or they have retreated already), may initiate combat against any and all unconquered **alien colonies** in the system. As *each warship may only initiate one combat per turn*, initiating combats against multiple enemy colonies upon arrival will require dividing the force (even if some of the targets are undefended, you must send a warship to convince them to surrender).
  - ✓ “On July 2 the Finns intercepted a radio message that the 63<sup>rd</sup> Guards Rifle Division and 30<sup>th</sup> Armored Brigade were about to launch an attack on July 3 at 0400 hours. The following morning, *two minutes before the supposed attack*, 40 Finnish and 40

German bombers bombed the Soviet troops, and 250 guns fired a total of 4,000 artillery shells into the area of the Soviets.” – from Wikipedia article, “Battle of Tali-Ihantala” (emphasis added).

- **Defend!:** Participation in combat, except for colony Defense Bases and colony-based Fighters or armed System Boats defending a colony, is always ‘voluntary.’ Units will always defend themselves if attacked, regardless of whether they have initiated combat in the current Turn Cycle, or how many combats they have fought recently, or whether or not they are on Combat Alert. Activation of the Combat Power is not required to defend in combat, and no Acts or Scenes are used to simply defend in combat. Certain defenders, namely starships and some System Boats and perhaps Fighters, may always retreat at the end of the first round of combat, as described later. Retreating the warships defending a system, may, however, expose any colonies in the system to subsequent attack.

- ✓ “The outer fortresses have fired. These ships enter the fiord darkened. They are warships, damned right we shoot at them! Ready for action!” – Col. Eriksen, *The King’s Choice* (2016), from English subtitles.

- **Run Away!:** Warships whose owners decline to initiate combat at the end of a Combat Movement lose the opportunity. Upon arrival in the destination system, the owners of the warships will be informed within their turn results of what they see and anyone in the destination system will be informed of the arrival of the warships (see *One-Way Mirror*, 2 Information, p. 1340, *infra*).

The owners of the warships have one day (24 hours) after their ships arrive (i.e. after their Regular Turn is processed) to initiate one or more combats by submitting Combat Orders for the first Combat Round. Failure to timely do so is considered a ‘pass’ and the opportunity to initiate combat from the Combat Movement is forever lost.

- **Meteora!:** Ships arriving in the destination system by Combat Movement *may* automatically join any ongoing combat in the destination system. If they join the defense of a colony, on the second Combat Round after they join forces, the Colony Combat is ended and the remaining combat is fought as a Ship Combat in system space, as those attacking the colony will seek to escape being caught between the defenses and approaching warships. This is not considered a *retreat*, unless the attackers actually issue retreat orders to their ships.<sup>19</sup>

---

*“There are two rules of war that have not yet been invalidated by the new world order. The first rule is that the belligerent nation must be fairly sure that its actions will make things better; the second rule is that the belligerent nation must be more or less certain that its actions won’t make things worse.”*

– Martin Amis, “The Palace of the End,” *The Guardian*, March 4, 2003

---

**Initiate Combat:** Activation of the Combat Power for the purpose of Initiate Combat requires one Act and one Scene on the star on the Public Space where the combat is initiated (one reason why you might use Combat Movement instead in some situations). Activation of the Combat Power for the purpose of Initiate Combat allows all friendly units in the same starsystem:

- 1) That are capable of initiating combat,
- 2) That are not currently involved in a combat, and

- 3) That *began* the Regular Turn in the starsystem (possibly arriving by Short Movement on the previous turn),

...to initiate combat against any number of opposing ships and/or colonies as appropriate. The side initiating combat becomes the attacker and the other(s), the defender(s) in the combat.

Activation of the Combat Power for the purpose of Initiate Combat requires one Scene on the star of the system where the Combat is to be initiated. Thus, the star must already be on the Public Space in order to place a Scene on it, and that means that either a ship or a sovereign colony must be in the target system. This is a place where Scene Snitching can really ‘hurt.’ ☺

- ✓ Except for Pacification Combat, *each unit* designated to Initiate Combat must check to see if they obey the Power Activation. The Supporting Colony(s) second check rule applies as described in Engines Offline, 1 Movement, p. 839, *supra*. If the units involved are Ground Units attacking another colony on the same planet, they check based on the Constructural Elements of their colony. If the Ground Units are landing on the planet to initiate combat, they check based on the Constructural Elements of their Transport Ship (see Lift & Separate, *et seq.*, 4 Combat, p. 987, *infra*). Units that fail to obey the Initiate Combat action will not fire in the first Combat Round and are not part of the combat initially; but likely can be joined later (see Those Who Stand Looking, 3 Combat, p. 973, *supra*) into the ongoing combat.
- Short Shot: Ships using Short Movement (see Space Hop, 2 Movement, p. 850, *supra*) arrive in the same Regular Turn as they departed, and thus, would be in the system at the *beginning* of the next Regular Turn. So it is possible to combine Short Movement one Regular Turn with Initiate Combat on the next Regular Turn *as long as the destination system is not an unsupported system* (requiring Combat Movement instead) and if the moving ships don’t want to initiate combat upon arrival. Remember to pre-place a Scene on the star of the system.
  - ✓ This does not provide any real savings in Acts and Scenes, as Short Movement requires one Act and one Scene on the origin, and Initiate Combat requires one Act and one Scene on the system where combat is initiated, as compared to Combat Movement requiring two Acts and one Scene on the origin. It would also require two Power Activations. It might be useful in limited circumstances where the position has not previously deployed Acts and Scenes that would allow a Combat Movement, or for diplomatic reasons.
- Uncles Sam and Albert Want You ☞: *Friendly units* that are:
  - 1) Capable of initiating combat,
  - 2) Not currently engaged in combat, and
  - 3) In the system where combat is initiated by ships arriving by Combat Movement may automatically join that combat and do not need to separately Initiate Combat.

---

*“The notion of a nuclear firebreak is based upon a major premise of current military thought: that a full-scale nuclear war, should one ever occur, would probably result from a conventional conflict that exploded out of control, prompting one side to use nuclear arms in a desperate bid to stave off defeat.*

*The only existing barrier to such escalation is a moral and psychological firebreak – the widely shared perception that nuclear weapons are different from all other weapons, and that their use could unleash a chain reaction of strikes and counterstrikes leading to total world destruction.*

---

*So long as this firebreak remains wide and secure, so long as the distinction between nuclear and conventional arms remains sharp and unambiguous, potential combatants will retain this incentive to stay on the non-nuclear side of the divide, no matter what their prospects are on the conventional battlefield.”*

– Michael T. Klare, “Securing the Firebreak,” *World Policy Journal*, Spring, 1985, p. 229

**DefCon 1:** Activation of the Combat Power for the purpose of Combat Alert requires one Act and one Scene on the star of the system where the alert is placed. Combat Alert applies to all friendly forces, whether ships or colony defenses, in the system where the Alert has been placed.

A position which has placed a system where they are present on Combat Alert and has at least one suitable available combat unit may *initiate one combat between their position’s Regular Turns*. Available units are any friendly unit that is:

- 1) Capable of initiating combat,
- 2) Located in a system where a Combat Alert has been placed,
- 3) Not currently engaged in Combat, and
- 4) Able to engage in combat in that theatre or sphere (e.g., Ground Units cannot initiate combat against Ships, see *Keep Your Friends Close, Your Enemies Closer*, 3 Combat, p. 972, *infra*).

The side initiating combat becomes the attacker and the others, the defender(s) in the combat. The Scene is used by the Power Activation regardless of whether or not combat is initiated.

- ✓ Defense Bases do not benefit from Combat Alert, the reference to colony defenses is to armed System Boats, colony-based Fighter Components and Ground Units.
  - ✓ Combat Alert may be particularly useful in timing of Raid/Strike Combats, see 4 Carriers & Fighters, *infra*, either before or immediately after the target’s Regular Turn.
- **Nervous from the Service:** A Combat Alert expires at the beginning of the position’s next *turn period* (see *Law of Periods*, 2 *The Streams of Time*, p. 84, *supra*), not when Regular Turn processing occurs. Thus, to keep up a continuous Combat Alert, a position must submit their Actions at the earliest opportunity, and activate the Combat Power for that purpose every turn in the same or different systems, which will hamper the position in other ways.
- **Firebreak:** All of the sputtering in the media over the casual comments made by the POTUS and some lesser figures in Russian government, are all in the fear that careless words indicate a lack of understanding of and breakdown of the nuclear firebreak.

*Non sequitur:* There is a difference between Initiate Combat and Combat Alert. It’s all about timing. Initiate Combat begins a combat shortly after the position’s Regular Turn, whereas Combat Alert, running from the end of the position’s current turn to the beginning of the position’s next turn period, allows initiation of combat in the starsystem between turns. Because ships arriving by Combat Movement must decide to initiate combat within one day of their arrival, their decision may be preempted by Combat Alert in the destination system, making the prospective ‘defenders’ the ‘attackers’ and taking the decision for combat out of the other position’s hands. Combat Alert, unlike Initiate Combat, may *put off* the decision to

start a combat to see what happens, *to allow for diplomacy time*, time to build, or to wait for other position's ships to arrive in the system on their turns. Both activations cost the same.

- ✓ “It’s not really hard to fire guns, but it’s immensely hard to make the decision to fire.” – Col. Birger Eriksen, Norway (post-WWII investigation).
  - ✓ As discussed more fully in Freeze Frame, 2 Information, p. 1341, *infra*, Observation and Surveillance reports are only provided in the position’s Regular Turn results after the Regular Turn actions have been processed. They are a ‘snapshot’ of the situation at the end of the position’s Regular Turn processing. Thus, whether to initiate combat using a Combat Alert between Regular Turns depends heavily on information provided by other positions who may be present (i.e. informal diplomacy, see Greys Diplomacy, 1 Diplomacy, p. 1097, *infra*) and who have their Regular Turns processed before the Combat Alert expires. Naturally then, Combat Alert is most useful in a crowded system where many positions are present.
- **Jumping the Ditch:** There is no check to see if a system placed on Combat Alert disobeys the Power Activation. However, if the position subsequently chooses to initiate combat, the Combat Alert is effectively changed to an Initiate Combat, and all units designated to initiate the combat must check, as described above, to see if they obey the Initiate Combat.

---

*“The essence of the complaints was that it let a dying generation off too easily – specifically, the generation that built and fought for the Third Reich. Crafting a story around the fates of five 20-year-old best friends from Berlin, none of whom is a Nazi, and one of whom is a Jew, is a convenient fiction, some said.*

*In truth, however, ‘Generation War’ is no more convenient than any number of American World War II dramas that do exactly the opposite and demonize all Germans by turning every one, without nuance, into a frothing-at-the-mouth stormtrooper. Isn’t making monsters out of people just as bad as trying to find the human heart that beats in the breast of the criminal?”*

– Michael O’Sullivan, “‘Generation War’ movie review,” Washington Post, March 13, 2014

---

**Generational War Cycle:** The Guns of August, the Tanks of September, the Missiles of October. Something important happened during the Cuban Missile Crisis in October 1962 that has not been fully realized in what I have read. We broke the historical generational war cycle. The time between the end of WWI and WWII was just under 21 years.

- ✓ Montross titled the chapter about the beginning of World War II, “The Resumption in 1939” in his *magnum opus*, War Through the Ages (3<sup>rd</sup> Ed., 1960) reflecting the idea that WWII was simply a continuation of WWI with a new actor, Japan, added.

The time from the end of WWII to the Cuban Missile Crisis was just over 17 years. By backing away from the brink, both sides broke the generational cycle of industrial warfare that was (by all projections) going to doom or significantly damage a nascent global civilization.

Given another half century, the forces in play dissolved, diffused, the energy flowed away in other directions, our trajectory changed, our world survived, but not necessarily as a better place. The criticism of this might be that *two occurrences do not a cycle make* (similar to: “Three writers do not a generation make.” – Gregory Corso), but the world might not have survived a third or fourth occurrence to confirm that a cycle does exist! If you were on a planet and it suddenly

became cold, you nearly died, then it became warm again, then cold again and you survived perhaps a little better, you'd be justified in projecting and preparing for a third period of cold expected at a specific future time, based on two experiences. You wouldn't wait to find out.

**Elizabeth Stephens:** *Paul, did you build an atomic bomb?*

**Paul Stephens:** *Only a little one.*

\*\*\*

**Paul Stephens:** *I never thought I'd say this to anybody, but I got to go get the atomic bomb out of the car.*

\*\*\*

**Dr. John Matthewson:** *You people really live in your own world, don't you?*

**Lt. Colonel Conroy:** *Well, we don't have the luxury of living in yours.*

\*\*\*

[Paul is sitting on the floor with the atomic bomb on his lap, he is surrounded by FBI snipers]

**Dr. John Matthewson:** *Now what do you say we take it all apart... before everybody goes crazy?*

**Paul Stephens:** *No, I'm sorry. I can't do that right now.*

**Dr. John Matthewson:** *This isn't accomplishing anything.*

**Paul Stephens:** *Sure, it is.*

**Dr. John Matthewson:** *What?*

**Paul Stephens:** *Deterrence.*

**Dr. John Matthewson:** *Deterrence?*

**Paul Stephens:** *Yeah, you know. Like when each side thinks... that the other guy is going to blow everybody up. It's called mutually assured destruction.*

**Dr. John Matthewson:** *Yeah, I know what it's called.*

**Paul Stephens:** *Well, it's working, isn't it?*

**Dr. John Matthewson:** *How do you mean?*

**Paul Stephens:** *I'm still alive, aren't I?*

\*\*\*

**Dr. John Matthewson:** *And since you all like scenarios so much... I've got one for you. It's called a little game of chance. I'll bet you that I can turn this key... and blow us all to hell... even after you shoot me. And you're gonna have to shoot me, OK? Everybody's problems all solved... in one millionth of a second. Now... who wants to play?*

\*\*\*

**Lt. Colonel Conroy:** *You mean I'm gonna die because some asshole didn't bring a pair of pliers?*

– The Manhattan Project (1986)

## Endnotes.

<sup>1</sup> **Citation:** “Who else could top this list more convincingly than humans? They defeated the Borg. They fought the Klingons into submission. They sent the Dominion back where they came from. And all the while, they did it while insisting to their enemies that they were only interested in peace, exploration and a nice cup of tea (Earl Grey, hot). There isn't a quadrant in the galaxy that's pleased to see a human turn up. And if nothing else, the Mirror Universe first ('Mirror, Mirror,' TOS 2.10) shows us that humanity has the potential to conquer the galaxy if only they get riled enough. No wonder the Vulcans spent so long trying to keep us down. It's the only logical response when faced with a race with so much destructive potential.” *Id.*

<sup>2</sup> **Commentary:** This is the same problem anarchists have: For every evil imagined or assigned to the state, an equally evil condition is evident in the absence of the state. Anarchists don't need to be convinced that anarchy is better than the state, but the rest of us do, and anarchist violence tends to highlight the need for a state to maintain order, e.g., the attempted assassination of Henry Clay Frick in 1892 by anarchist leader Alexander Berkman.

- ✓ The problem with Anarchist movements is that it is very easy for the opposition to argue or construct an image that they are a threat to civilization. To the audience, it seems as though they want to throw everything away, they seem to criticize everything the audience knows and perhaps loves. We all want small changes to this or that, but few want to toss everything out and go back to the trees, or start over again.

<sup>3</sup> Citation: "...the fact that in America, you and I would had to have worn fedoras and suits on a hot summer days. Thank god that's gone, but something else that left was the sense that you put speech in its Sunday best. All of us nowadays at least fake it to an extent, but we could have predicted that somebody would come along who really just didn't bother to do anything but talk, rather than speak, and even become President of the United States. I don't think that Trump is going to be last in that regard." – John McWhorter, MSNBC 11<sup>th</sup> Hour, September 15, 2017.

<sup>4</sup> Citation: Jurmain, Nelson & Turnbaugh, Understanding Physical Anthropology and Archeology, 3<sup>rd</sup> Ed., 1987.

<sup>5</sup> Citation: Dupuy & Dupuy, Encyclopedia of Military History (2<sup>nd</sup> Rev. Ed., 1986); Wikipedia article titled "Sword" puts the date at 1600 B.C.

- ✓ A March 11, 2020 video posted by Pete Kelly "BREAKING NEWS – 'Oldest Sword In The World' Discovered // Aslantepe // Bronze Age Weaponry," announced the discovery of a Bronze Age sword made about 3,000 B.C., possibly at Aslantepe, housed in a collection of medieval swords at a monastery in Venice. The Assyrians have long been credited with the early adoption, if not invention, of the sword, but the video notes that the Assyrians attacked Aslantepe in Turkey. However, focus on the earliest invention of the sword is in the area of Aslantepe which had some of the most advanced metallurgy of the time.

<sup>6</sup> Commentary: The argument might be that we have simply traded one bad for another ill, probably people drink less alcohol now, maybe we eat better foods now, but we also smoke and do less physical labor as a civilization.

- ✓ "Every age, every culture, every custom and tradition has its own character, its own weakness and its own strength, it's beauties and ugliness; accepts certain sufferings as matters of course, puts up patiently with certain evils." – Hermann Hesse, Steppenwolf (1927) (see full feature quote, top 4 Culture, p. 404, *supra*).
- ✓ See also 'whac-a-mole' discussion. *Id.*

<sup>7</sup> Commentary: My first nuclear war movie was shown in school. I remember it was deemed so controversial, so potentially disturbing that they sent home permission slips for parents to sign. My mother, the pacifist, gladly signed the slip (I may remember this as a rite of passage that I was old enough now); about half the class got out early that day or went to study hall, I don't remember. The movie I remember was a Japanese-made animation of the morning of the bombing of Hiroshima that showed people melting like ice, instead of the flash vaporization of later movies like the Day After. I think that it must have been in my 6<sup>th</sup> or 7<sup>th</sup> grade, I just don't remember where I was when I saw it. It certainly was before I saw any nuclear war movies on television, including Damnation Alley (1976, and Twilight's Last Gleaming, 1977) both of which I must have seen later on TV around 1981-83.

- ✓ I definitely did not see Damnation Alley in the theatres in 1977 (I didn't see anything in the theatres in 1977, I assure you), so I must have seen the network TV premier (altered, reedited) version in June 1983.

<sup>8</sup> Citation: "Cyanide capsules are easy to make and reliably lethal. They have been used for murder, executions and suicides and as a trope in popular culture. Potassium cyanide is easy to obtain, store, transport, conceal and unobtrusively self-administer. Cyanide ends life by arresting cellular metabolism by preventing hemoglobin from transporting oxygen. Thus, it causes a form of chemical asphyxiation. The public imagination of military cyanide suicide capsules is informed by movies such as *Skyfall* (a James Bond movie that showed a malfunctioning tooth capsule) and *Get Smart* (that used a suicide pill for a gag line).

The history of the use of suicide capsules by the armed forces or intelligence agencies is murky but suggestive. Heinrich Himmler, a senior Nazi commander, used a cyanide capsule to commit suicide upon his arrest. Hermann Göring, another Nazi official, took cyanide shortly before he was to be executed at Nuremberg. A Flight Surgeon gave the pilot of the Enola Gay cyanide capsules to distribute to the crew in the event they crash-landed in Japan after dropping the atomic bomb on Hiroshima. Washington DC's spy museum displays CIA Cold War era eyeglasses containing a cyanide pellet. Concerns about cyanide gas accidentally escaping inside the cockpit or flight-suit of spy plane pilots led the CIA to develop a fish-based neurotoxin to be self-injected with a needle. Such a device was concealed in a coin given to CIA pilot Francis Gary Powers for his 1960 U2 spy flight over the Soviet Union. If captured, as he was, Powers had been instructed to cooperate while maintaining the dignity of his office. Although some criticized Powers for not taking his life, the turbulent high altitude destruction of his aircraft and prompt capture made it unlikely that he could have used the suicide device even if [he] had chosen to do so. ...

North Korean agents and Tamil Tigers have also been known to have and used cyanide capsules. The United States government denies that suicide pills are provided to soldiers faced with capture by ISIS." – Steven H. Miles, M.D., "Military Suicide Capsules and Medical Ethics," Bioethics.net, March 21, 2016 (emphasis in original).

1 Combat – The Come As You Are Party

<sup>9</sup> Commentary: The scientific-sounding dialogue is kind of corny, but it gets the central point across and is critical to set the stage for the rest of the movie – that the radiation from the Northern Hemisphere war is spreading south.

<sup>10</sup> Citation & Commentary: The opening scenes of *The Book of Eli* (2010), set decades after the nuclear holocaust, features discovery of an apparent isolated survivor suicide. A later scene also features human cannibalism.

- ✓ I enjoyed *The Book of Eli* (2010). It follows the usual post-apocalyptic formula – it is a fight between the good guys and the bad guys over who will control reemerging civilization (i.e. how are we going to avoid making the same mistakes again?) – but *The Book of Eli* is clever, creative within the genre framework, and restrained. Much of the movie is like a Western, the scene where the bad guy tries to shoot Eli and cannot kill him even at close range in daylight reminded me of the tub scene in *High Plains Drifter* (1973).

<sup>11</sup> Commentary: The population of Australia in 1959 appears to have been about 10 million; it was at 22 million in 2009. Source, ChartsBin (<http://chartsbin.com/view/eoo>), “Historical Population of Australia, 1788 to Future.”

<sup>12</sup> Commentary: A favorite Far Side comic, cows are in the house, the phone is ringing. One cow says, “Well there it goes again... And we just sit here without opposable thumbs.”

<sup>13</sup> Commentary & Citation: “Perhaps they’d come upon another expanding civilization and encounter beings previously known only from their radio transmissions. Star wars are unlikely. One civilization certainly would be far more advanced than the other. It would be no contest.” – Carl Sagan, *Cosmos*, Episode 12 (see top of 4 Expansion, p. 920, *supra*, for full feature quote).

- ✓ The *Cosmos* series was, of course, pro-empiricism and anti-Cold War, and as such, it is understandable that Carl Sagan and Ann Druyan (and Norman Spinrad) were probably appalled by the *Star Wars* movies. Thus, this bit of narrative (and his later book/movie Contact) were intended to discourage *Star Wars*-like visions of galactic civilization. Yet, when I re-watched the episode a generation later, I was very disappointed at the flippant nature of his comment and failure to provide any reasonable basis for the assumption that one civilization would be far more advanced than the other – and if so, why they would not crush the other civilization: Though I am sure Carl Sagan would consider that unreasonable for a scientifically-enlightened species, GGDM doesn’t make that assumption. Did Carl Sagan know something he couldn’t tell us? Because, if not, he was making affirmative statements about something he could not possibly know for certain. In that sense then, Carl Sagan is both human and no different than the clergy and bible beaters.
- ✓ “The Pythagoreans and their successors held the peculiar notion that the Earth was tainted, somehow nasty while the heavens were pristine and divine.” – Carl Sagan, *Cosmos*, Episode 7); angelic traits and enlightenment are being assigned by Carl Sagan to residents of the far away heavens by virtue of their positions.

<sup>14</sup> Commentary: *Hell in the Pacific* was one of the big losers of 1968 because of anti-Japanese prejudice and/or lack of dialogue and action which the Vietnam Era, Cold War audience either didn’t comprehend or wasn’t in the mood to watch. It followed another movie of 1968, *2001: A Space Odyssey*, which also had extended opening scenes (and other long sequences) without either humans or dialogue, and which was doing so poorly that it was nearly pulled from theatres after three weeks, but then began to be appreciated as art. *Enemy Mine*, like its predecessor *Hell in the Pacific*, was also a box office failure, even without Americans vs. Japanese. But the former Soviet public was in the mood to watch and appreciate the movie, it was the first big Western sci-fi import film success.

<sup>15</sup> Commentary: Ms. Druyan then suggests that the explosive progress of science is due to the end of the Cold War.

- ✓ At the end of the Cold War, people thought, ‘well we survived that and now it’s over,’ the world moves on, they wanted to forget the Cold War, forget the threat of global thermonuclear annihilation and bask in the glow of the technologies sprung from the Cold War. This was *the mistake*, history is never ‘over,’ it was the same mistake made after World War I; expansionist militant ultra-nationalism ideologies were not ‘over’ or ‘history’ then (or now) as subsequent history demonstrated. The world does indeed move on, whether we want it to or not, dragging chains behind like Marley’s ghost in A Christmas Carol (1843).

<sup>16</sup> Citation: “‘Happy new year, everybody!’ the host joked. ‘We have two maniacs with nuclear warheads bragging about who has the bigger button.’” – Jimmy Kimmel, as quoted in *The Guardian*, January 4, 2018.

<sup>17</sup> Citation: This identical paragraph was also in the 2<sup>nd</sup> Edition published in 1946 (p. 948), so Montross had or picked up on this idea between 1945 and 1946. This must have been discussed in the intellectual-social circles.

<sup>18</sup> Citation: cf. the Scouting activation of the Expansion Power, Through the Never, 3 Expansion, p. 907, *supra*.

<sup>19</sup> Commentary: The section title is in reference to the WWE double-diving knee drop aerial move, not to the medieval monasteries in Greece.

*“A’ warring for the heavens!”*

– Megadeth, “Symphony of Destruction” (1992)

*“The fact is, even in the old days, fully loaded, crewed and armed, the Andromeda was only an even match for a Pyrian Torchship. In case anyone hasn’t noticed, we’re not fully loaded, armed, or crewed, and the Pyrians have had three centuries to improve their technology.”*

– Dylan Hunt, Andromeda, “Pitiless as the Sun” (2001)

Page | 951

**Era Warships:** Warships are classified by Era; that is, there are 1<sup>st</sup> Era Warships, 2<sup>nd</sup> Era Warships, and 3<sup>rd</sup> Era Warships. The Era Warship represents the best of all of the technology and engineering of its Era. Positions, may of course, improve Era warships by use of permanent or expendable Enhancement Technologies,<sup>1</sup> and small improvements by use of Continuous Operational Technologies developed during the Era, such that, with skill and luck (see Army of Light, 2 Colleges, p. 479, *supra*), a 1<sup>st</sup> Era Warship might give a 2<sup>nd</sup> Era Warship a good fight.

- ✓ The Babylon 5 television series provides a clear example of ships from three Eras. During the Earth-Minbari War, the damaged heavy cruiser EAS Lexington – a basic 1<sup>st</sup> Era Warship of Earth Force – destroyed the Minbari warcruiser Black Star – a 2<sup>nd</sup> Era Warship – by luring them into an ambush of nuclear mines. Some of the stiff-necked Minbari took exception that the Earth Force ship didn’t defeat the Black Star in a fair fight.<sup>2</sup> The 3<sup>rd</sup> Era Warships of Babylon 5 belong to the Shadows and Vorlons, the last remaining first races. One would assume that Minbari ships have as much chance against Shadow or Vorlon warships as Earth Force warships had against Minbari warships. Centauri and Narn warships are larger, advanced 1<sup>st</sup> Era Ships.

A historical example of earlier Era warships defeating technologically superior enemies is the Battle of Campeche in 1843. During that battle, two sailing ships, a Sloop-of-War and a Brig of the Republic of Texas Navy, defeated two steam warships of the Mexican Navy, a wooden-hulled ironclad and an iron-hulled paddle-wheeler that were manufactured by Britain and crewed by British sailors. It is the only known battle where sailing ships defeated steam ships.

- ✓ On the flip side, 16 years earlier in 1827, a British-French-Russian allied naval force of 22 warships defeated a poorly-armed Ottoman-Egyptian fleet of 78 warships (plus fire ships and smaller boats) in close range combat at the strange Battle of Navarino Bay – after the allied fleet deliberately sailed into an obvious classic trap and dropped anchor close in front of the enemy ships and flanking shore batteries – sinking two-thirds of the Ottoman and Egyptian ships in a couple of hours while silencing the shore guns. This was the last massive fleet battle between sailing ships. Effective numbers of the Ottoman-Egyptian fleet are uncertain, but regardless, the battle wasn’t close, they were very badly mauled.<sup>3</sup>
- **First Era Warship:** The 1<sup>st</sup> Era Warship Patent is an Existential Patent which positions may obtain before the game begins. Whether that is a wise choice or not depends on subsequent events; everyone wants ‘peace in their time,’ players may agree on a utopian peaceful game of exploration, but if the other guy has a warship, no matter what his intentions, you have to

have one too, just to be sure. Warship Patents are Physical Item Technologies (PIT) as they create the basic units of the game. See View from a Height, 1 Construction, p. 660, and Physical Item Technologies and Technological Devices, 2 Patents, pp. 739, 741, *supra*, regarding game units. Each position will need to develop their own PIT Patent for 2<sup>nd</sup> and 3<sup>rd</sup> Era Warships, pursuant to the rules of this section and the applicable *Uber Alles*.

- ✓ Completion of the 1<sup>st</sup> Era Warship Existential Patent allows a position to build warships at any sovereign colony that has an Orbital Shipyard, for 30 RPs.
- Ship of the Line: Warships produced by use of the Era Warship Patents, are assumed to be the average, middling ships of the line of the Era.
  - ✓ The term “ships of the line” dates from 1706 according to Merriam-Webster online dictionary; an oddly late development in the Age of Sail, classically 1571 to 1862.

Positions are free to develop Patents for specific classes of ships, for example, Battle Cruisers, Dreadnoughts,<sup>4</sup> Death Stars, Warstars, Powerstars if you like, SDFs, Heavy Cruisers, Missile Ships (see 4 Carriers & Fighters, p. 1081, *infra*), Juggernauts, Birds of Prey, Berserkers, Sentinels, Guardians, Hulkers, Flag Ships, Magog Assault Ships, Gosroth Patrol Ships, War Rigs, whatever suits the tactical, economic, and strategic needs (and sounds cool).

- Magnitude of Eras: The difference between warships of successive Eras is not just a slight or a linear improvement in capabilities, rather, the difference between a 1<sup>st</sup> Era Warship and a 2<sup>nd</sup> Era Warship is a systemic order of magnitude,<sup>5</sup> progress in warship technology of each Era is near exponential. Second and later Era Warships may gain new dimensions of capability over their predecessors due to the *Uber Alles* of their Era (see 2 Eras, p. 767, *supra*).
  - ✓ A distinction can easily be made by historical example. In 1853, a Russian fleet armed with Paixhans guns – the first naval gun to fire flat trajectory explosive shells, annihilated an Ottoman fleet at the Battle of Sinop, 30 years after the gun was invented, dispelling all remaining doubts. Only the Russian, French, and United States navies had Paixhans guns on ships at that time, Commodore Perry had Paixhans guns on the expedition to Japan in 1853. After Sinop, the British and other navies were in a race to ‘up-gun’ their ships; in GGDM terms, this would be an Enhancement Technology. It was the later addition of steam power (there were a few armed steamers at Sinop), plus iron armor (defense against Paixhans shells) and the invention of the gun turret (independently in Britain and the US) that completed the 60-year evolution to the metal, turreted, steampowered, oceangoing warships of WWI (2<sup>nd</sup> Era Warships).
  - ✓ The HMS Dreadnought was launched in 1906, the first modern battleship, which gave its name to a class of similar ships built between 1906 and 1920. The HMS Dreadnought made all other ships – retroactively called pre-Dreadnoughts (ships built between 1880 and 1905) – instantly obsolete. Eventually the original term battleship reasserted itself as the name for the largest capital warships in the naval lexicon.

Warship progression in the last two centuries is perhaps one of the most obvious examples of Era differences. The fleets that fought at Jutland in 1916 would have stood little chance against the fleets that fought at Midway in 1942 or later. The Era difference provides the stark dramatic choice in the 1980 movie, *The Final Countdown*: The USS *Nimitz* is pulled back in time to the day before the Pearl Harbor attack,<sup>6</sup> the captain must decide whether his duty to defend the United States exceeds the possible historical and temporal calamity of the

Japanese attack fleet being smashed (there would be little contest) by the 100,000 tonnes nuclear-powered, missile-armed, supercarrier from the future.

- ✓ “A range of 4,000 yards had been considered long at Tsushima...” – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 712 (see EN 4, p. 966-967, *ut infra*).

In a government-made video available on YouTube, produced around 1960, the 122mm recoilless Davy Crockett anti-tank gun fired a very small yield nuclear warhead at a target 4 kilometers away (“M388 Davy Crockett Operational Test,” posted by jaglavaksoldier). A single Davy Crockett would defeat a ship at the Battle of Tsushima, 1905. Mike drop.

- ✓ In Science Fiction: The Andromeda television series had the most integrated, advanced technology and is perhaps one of the better mainline sci-fi examples of 3<sup>rd</sup> Era Warships, alongside the Vorlons and Shadows in Babylon 5. I don’t know where the Death Star stands in terms of Eras in GGDM, it was huge, but didn’t seem greatly advanced – other than its power core – compared to the technologies displayed in later sci-fi settings; I am sure the Death Star and Battlestar Galactica would easily both lose to the Andromeda, or any Shadow or Vorlon ship. Or even a Borg Cube. There are many of these cross-universe battle videos, comparisons and discussions on YouTube, it’s a nerd sub-genre that people argue about in the comments sections.
- Era Inflation: The cost of warships will also increase by magnitudes by Era progression:
  - ✓ For example, suppose a Corvette model of the 1<sup>st</sup> Era Warship cost 16 RPs to construct, the comparable 2<sup>nd</sup> Era Warship would cost 25 RPs and the 3<sup>rd</sup> Era version should cost 36 RPs. That is, the 1<sup>st</sup> Era Matrix is 4x4 and has spaces for 16 Applications (see #IGY, 1 Eras, p. 757, *supra*), the 2<sup>nd</sup> Era Matrix is 5x5 and the 3<sup>rd</sup> Era Matrix is 6x6 with space for 36 Applications. Alternatively, if the cost is based on connections in each Era, the 1<sup>st</sup> Era Warship would cost 42 RPs to build! *Id.*

Destruction of a superior Era warship by a lower Era warship can be a form of economic victory. In 1916, the German Empire claimed victory at the Battle of Jutland on the basis that they lost less ships and men than the British (in tonnage sunk); despite this claim, the German High Seas Fleet remained bottled up in port, and never challenged the British again. The Germans instead changed to unrestricted submarine warfare... See also ship building rate discussion, Shipbuilding and Strategic Shipyarding 3 Construction, pp. 675-676, *supra*.

- ✓ “Paradoxically, the Germans had invested so much into the capital ships that they had essentially become too valuable to risk and thus, ineffective.” – Narrator, “The Battle of the Barents Sea” (1942), vandpubsell YouTube channel, December 7, 2019.

---

*“Captain Sheridan, this is an emergency transmission. President Clark is dead. He took his own life before we could arrest him. But he left a message on his desk. Two words. ‘Scorched Earth.’ Captain, I believe he’s turned the defense grid toward Earth. We can’t override the systems here. If you don’t stop them, they’ll fire in 10 minutes. Captain, the particle beams on those defense platforms can level 40% of the planet’s surface. You have to stop them before they can fire!”*

– Senator Crosby, Babylon 5, “Endgame” (1997)

---

**Colony Defense Bases:** Colony Defense Bases are the colony's main and last defense against aliens or enemy warships.<sup>7</sup> Colony Defense Bases are considered installations, and are built on sovereign colonies by activation of the Construction Power for the purpose of Colony Enhancement. There are three Defense Base Existential Patents available: Ground Defense Base, Orbital Defense Base, and System Defense Base (detailed previously in 2 Construction, p. 668, *supra*).

- ✓ Ground Defense Bases are on or under the surface of the colony Planet which limits their effectiveness against warships, but they are important as a defense against Raiders and in Ground Combat.
- ✓ Orbital Defense Bases may/must have some orbital maneuvering capability, but obviously cannot leave the orbit of their colony. They control the planetary approaches.
- ✓ System Defense Bases are huge, heavily armored, imposing, and are placed farther out (perhaps at Lagrange Points<sup>8</sup>) to keep attackers at a safe distance from the colony.

Bases *do not have* Constructural Elements, using their colony's instead, magnifying the effect of an inactive Epistemological Constructural Element at their colony. Defense Bases may receive the benefits of permanent and expendable Enhancements, and new Continuous Operational Technologies improvements, as appropriate. Positions may develop variations and new levels of Defense Bases, and other defenses, by use of Patents. Defense Bases may not initiate combat against either ships or colonies *on other planets*. Though that would be a cool ability....

- ✓ Although Defense Bases are Colony Enhancements, an enhancement to a game unit (see View from a Height, 1 Construction, p. 660, *supra*), they are treated as 'units' in combat; 'units' in combat (or combat unit) is not exactly the same as a game unit; a *combat unit* is one capable of combat interaction with the enemy, which is not the same as initiate combat. Thus, Defense Bases are 'combat units' not capable of initiating combat. Not all 'combat units' have their own Constructural Elements.

However, per the Babylon 5 "Endgame" quote above (and a few score other sci-fi stories), it may be possible for at least Orbital Defense Bases to join or initiate combat against **alien colonies** *on the surface of their planet* or in Orbital Cities. In fact, this is similar to a concern holding up construction of a proposed asteroid defense system on Earth, it is called the Deflection Dilemma (see 2 Construction, p. 669, *supra*). Participants can address these issues in the game story.

➤ **Colony Defense Era Upgrade:** All three types of Defense Bases are available to positions in the 1<sup>st</sup> Era through Existential Patents. Unlike warships, Defense Bases do not have an 'Era progression' arc (that is, no PIT Patent is needed for 2<sup>nd</sup> Era Ground Base, etc., positions only need one of each Defense Base Patent), and would soon become obsolete, except that, upon reaching the next Era, *existing* Defense Bases can be upgraded to the position's current Era by use of an activation of the Construction Power for the purpose of Colony Defense Era Upgrade using one Act and one Scene on the sovereign colony where the upgrade occurs.

- ✓ Colony Defense Era Upgrade never includes or effects Fighter Complements, see Next Generation Fighters, 1 Carriers & Fighters, p. 1048, *infra*.
- ✓ The cost of upgrading a colony's Defense Bases one Era is 25% of the collective cost of building all of the Defense Bases originally (fractions truncated).

The game can be adjusted to suit the players or through collective experience. The primary aspect to understand is for each colony to be upgraded, the cost is an Act, Scene, Power Ac-

tivation and RPs. For a position with a large number of colonies and/or heavily defended colonies, this will be costly. Choices will need to be made against other pressing needs, risks assessed, some may be left behind. The percentage can be adjusted between 10% and 50% of the original collective cost of the Defense Bases – either because participants want a more or less defensive game or because play experience (*the crucial element lacking during this design process*) demonstrates that the base 25% cost is either too high or low.

- ✓ A Defense is only as strong as its weakest point; therefore, all of the colony's Defense Bases must be upgraded to the next Era, before any of the colony's Defense Bases can gain the benefit of the next Era in combat.
- ✓ Upgrading a Colony's Defense Bases may be done in installments with several activations of the Construction Power for that purpose, but no benefit is received until the upgrade has been completed.

The primary problem with Colony Defense Era Upgrade is that it is a construction project, and thus location specific, with local GDP limitations, and requiring activations of the Construction Power on specific colonies using Scenes. There are no shortcuts. Thus, it is most efficient to complete upgrades with one Power Activation.

- ✓ Colony Defenses cannot be upgraded two Eras with a single activation of the Construction Power for the purpose of Colony Defense Era Upgrade. Thus, colonies that have 1<sup>st</sup> Era Defenses will need two *completed upgrades* to be brought up to the 3<sup>rd</sup> Era when technology has progressed to the 3<sup>rd</sup> Era.

GGDM design is built throughout on a balancing system of two-tiered asymmetrical relationships, cf. warship and defense base era progression.

- **New Era Bases:** New Defense Bases may be constructed at any eligible colony *after* a colony defense has progressed to the next Era; these Bases will cost the same as their predecessors, but the additional cost must be paid to upgrade them when upgrading the colony defenses (i.e. no free upgrade). Defense Bases built in the new Era will not receive any benefits of the new Era in combat until the entire Era upgrade is completed at their colony.

---

*“With possible exception of the Crimean War, the Gallipoli expedition was the most poorly mounted and ineptly controlled operation in modern British military history. Surprise had been lost even before the inception of the plan, for a premature bombardment of the outer Dardanelles defenses early in the war (November, 1914) had awakened both Turks and Germans to the danger.*

*Under Liman von Sanders' competent direction the fortifications had been vastly strengthened. The prize was a rich one, for success would mean keeping Russia in the war and probably knocking Turkey out; its attainment should have been confided in a single commander, provided with the best of means. Instead, with improvised organizations, both naval and army commanders worked independently. ...*

*Back in the war office, Kitchener failed to assure compliance with logistical, strategic and tactical fundamentals of mounting an expeditionary force. And he refused Hamilton's requests for adequate forces and staff officers.”*

– Dupuy & Dupuy, *Encyclopedia of Military History* (2<sup>nd</sup> Rev. Ed., 1986), p. 955

---

**Defending the Obsolete:** ‘Obsolete’ defenses are not automatically vulnerable to attack, even by ships of a later Era. There are many political, economic and military factors that might also affect the outcome.

The Ottoman defenses at the Dardanelles were mostly obsolete, with only 14% of the guns of newer design, limited ammunition, and somewhat inadequate protection and night illumination. The Inner Defenses were the most outdated and of limited range. However, the attacking Allied naval forces were a mixture of new and obsolete ships as well and the minesweepers were civilian trawlers. The preemptive attack in November 1914 alerted the Ottomans to the threat and they added more minefields, brought up more ammo and field guns and tried to upgrade their protection.

More Allied attacks in February and March 1915 failed to clear mines or meaningfully damage the defenses with indirect naval gunfire. On March 18, 1915, the Allied naval forces made an all-out final attack on the Ottoman shore defenses, but were repulsed by several factors, including the combination of shore guns fire, underwater mines which struck several ships that turned starboard (the defenders had noticed the pattern in previous attacks), the inability to clear mines in front of the advance, and some timidity by the Allied naval commander. After the attack, the Ottomans retained several layers of naval mines the Allies had not reached, and defenses which had not been engaged at all.

The allies called for ground troops which landed in two places on April 25, 1915 under mostly ineffective naval gunfire, while between April and May 1915, three Allied battleships stationed off the Gallipoli beaches were sunk by torpedoes, and the permanent fire support of the battleships was lost when the ships withdrew. As history records, the campaign of Gallipoli to flank the fortifications on the land side, became an infamous debacle, with the Allies withdrawing after ten months, with 200,000+ dead and 110,000 evacuated as sick.

- ✓ Information and specific figures taken from Wikipedia articles, “Gallipoli Campaign” and “Naval operations in the Dardanelles Campaign,” on December 26, 2018, though I am, of course, familiar with the campaign from several history books of my youth. This is generally true of most subjects on which I comment and cite to Wikipedia articles, I possess a pre-Internet and non-Wikipedia base of learning against which Wikipedia serves as a refresher and a source of specific facts and figures.
- ✓ The attempted Kriegsmarine attack on Oslo in 1940 bears some similarity to the British attempt to force the Dardanelles in 1915, excepting that the Germans execution all around was far better than the British, they had actual surprise, and air power made a huge difference in the outcome.

---

*“He who defends everything defends nothing” – Frederick the Great*

---

**Defending the Nothingness:** The weakness of a chain is its weakest link. Colony Defense Bases are a *cordon defense*.

- ✓ “From such a disposition, consisting of several detached posts, to the cordon system, there is still certainly a considerable step, but it is one which generals, nevertheless, often take without being aware of it, being drawn on from one step to another. First, the covering and the possession of the country is the object of the dispersion; after-

wards it is the security of the army itself. Every commander of a post calculates the advantage which may be derived from this or that point connected with the approach to his position on the right or the left, and thus the whole progresses insensibly from one degree of subdivision to another. A cordon war, therefore, carried on by the principal force of an army, is not to be considered a form of war designedly chosen with a view to stopping every blow which the enemy's forces might attempt, but a situation which the army is drawn into in the pursuit of a very different object, namely, the holding and covering the country against an enemy who has no decisive undertaking in view." – Carl von Clausewitz, On War (1832).

- See also Areal Phenomena, 2 Carriers & Fighters, p. 1062, Under Your Desk, 4 Carriers & Fighters, p. 1085, *infra*.

In military matters, half-measures are rarely effective. There may be cases where even funding a basic bare defense force is of little use. Some GGDM participants may pin their hopes on non-military survival, seeding space, racing ahead in non-military technologies, for example.

- ✓ 1864 and April 9<sup>th</sup>: The situation in the Second Schleswig War of 1864 (subject of the Danish television series 1864 (2014)) and the German invasion of Denmark on April 9, 1940 (subject of the Danish movie, April 9<sup>th</sup> (2015)), separated by three quarters of a century, is little changed. In 1864, in addition to outnumbering the Danish forces, the Prussians were using breach-loading rifles which allowed them to reload while laying prone, whereas the Danish forces were still using muzzle-loading rifles which required them to stand while reloading. Thus, the Prussians had both a technological and numerical superiority on land (the Danes had naval superiority), while the defenders were patriotic and brave, they were doomed by leadership and equipment failures, and by population and industry disparity. In the movie April 9<sup>th</sup>, a platoon of Danish troops on bicycles, with rifles and a light machinegun, supported a unit on motorcycles, with a couple of light machineguns and a 20mm sidecar mounted gun. The Danish troops had bolt action rifles and limited ammunition, and apparently no grenades. They were facing German troops with armored cars, motorized infantry, and a Panzer II tank, it is likely that most of the German troops were also carrying bolt action rifles in early 1940, the switch to assault rifles did not occur until 1941.

Although the following is about Holland *in a different era*, Lynn Montross makes the point well:

- ✓ “But genius alone could not atone for the inferiority of Dutch ships, or the penny-wise policies of the merchants ruling the republic. Although Blake and Monk were beaten twice and severely handled even in their four victories, England was able to impose humiliating terms of peace. The temporary ruin of her commerce and fisheries taught Holland a lesson which led to reforms before the struggle was resumed twelve years later. Nevertheless, De Ruyter labored under handicaps which he overcame by sheer skill and audacity.” – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 330.
- ✓ And in early 1940: “But it is hardly necessary to add that the soldier is not the unit of today's warfare – In Poland the German advantage in numbers was less than two-to-one, as compared to a superiority of perhaps thirty-to-one in mechanical horsepower. The French and British had but three armored and three mechanized divisions in the spring of 1940 to oppose twelve German armored divisions, each with two and a half

times as many tanks. A much greater ratio of superiority was enjoyed by Hitler's mechanized units and air squadrons. Even in such defensive weapons as antitank and antiaircraft guns the Germans held an enormous advantage over armies which relied upon a defensive strategy. Altogether, it seems safe to assume that the Wehrmacht and Luftwaffe began the campaign with material odds of at least five-to-one in their favor." – Lynn Montross, *War Through the Ages* (2<sup>nd</sup> Ed., 1946), p. 796 (this paragraph appears to have been edited out of the 3<sup>rd</sup> Ed., 1960).

- ✓ *Speed advantage alone should not be underestimated*, speed kills quickly: "It has been suggested that if the generalissimo had been ready with a central mass of manoeuvre, he might have stopped the foe at Sedan. But the speed of enemy motorized advances, as compared to Allied movements, makes this hypothesis doubtful. It must also be remembered that the defenders were at a tragic disadvantage in tanks, planes and artillery. Above all, time had beaten France – the lost months before the war, the lost days of the early phase, and now the lost hours against a foe who did not lose minutes." – Lynn Montross, *War Through the Ages* (2<sup>nd</sup> Ed., 1946), p. 801 (rewritten section appears on p. 811 in the 3<sup>rd</sup> Ed., 1960).

This is a professional journalist and historian's polite way of saying the Germans ran circles around the French in 1940. The French plans still relied on timetables set for railway mobilization and supply; the Germans had not only mechanized/motorized their forces, but also had air superiority to bomb railroad bridges and stations to disrupt French national mobilization.

- ✓ Cordon colony defenses are defeated in detail by concentration of force; the attacking fleet concentrates against one sector at a time, eventually eliminating all Defense Bases.

**Master:** *What do you think is the best coastal defense?*

**Student:** *Building forts along the country's shores and equipping them with modern cannons.*

**Master:** *Wrong! Japan is surrounded by seas. You can't keep them out by building forts. Fool.*

**Student:** *Then let me hear your thoughts, what is the best defense?*

**Master:** *The Black Ships. [Referring to Commodore Perry's expedition specifically, and Western ships generally]*

**Student:** *What?*

**Master:** *Repel those who come by sea in the sea. Japan should build her own black ships and form a navy.*

\*\*\*

**Master:** *By knowing their mechanism and technology, there is no way we cannot make what the Westerners make. That includes the Black Ships. ... We should use him [Napoleon Bonaparte] as a role model and educate ourselves in Western arithmetic, science, military and medicine. And those who want to shoot cannons can go elsewhere.*

**Student:** *I get it, that's what we lack. More than the number and skill of shooting cannons, but the knowledge base or knowledge of foreigners.*

– dialogue from the Japanese-language tiaga drama series (with English subtitles) *Yae no Sakura* (2013) in Episode 1<sup>9</sup>

**Islands of Resistance:** Colony defenses are ‘islands of resistance’ on the strategic level, a Besieged Colony is basically a failed colony attack, and unconquered colonies continue to pump out resources and ships for the enemy; bypassed colonies do so in your rear.

Ongoing Ground Combats, Pacified or Converted colonies with insurgencies (see Green Zone, 2 Order, p. 541, *supra*, and Fabrication of Order, 6 Combat, p. 1022, *infra*) are like the ruined villages of the Spanish Civil War or the Eastern Front in World War II, irritating and sniping:

- ✓ “This precept was taught to recent civilians – Spanish peasants and workers who had the courage to turn ruined villages into improvised fortresses after the mechanized forces swept past. Soon the attackers had to send back strong detachments to cope with snipers preying upon their flanks and rear. One such strongpoint could be reduced without too much cost; but when every village became, in military jargon, an ‘island of resistance,’ the attack was bled of its impetus by the detachments needed to battle their way from house to house in bitter street fighting. Neither tanks nor armored cars were of much use in such operations, and the assailants usually suffered heavier losses than the defenders.” – Lynn Montross, *War Through the Ages* (3<sup>rd</sup> Ed., 1960), p. 775.

When considering the cost of warships vs. colony defenses, players should consider that colony defenses are strategically static, though necessary, whereas warships are mobile, can disperse, concentrate and maneuver, and represent the ability to project power to the enemy areas. This is the classic defense vs. power projection problem.

---

*“To ravage, to slaughter, to usurp under false titles, they call empire; and where they make a desert, they call it peace.”*

– Publius (or Gaius) Cornelius Tacitus on the Carthaginian Peace

---

**Combat Categories:** There are six types of combat: Ship Combat, Colony Combat, Orbital Bombardment, Ground Combat, Colony Pacification Combat and Raid/Strike Combat. Any Combat Power Activation that allows for the initiation of Combat will, under qualifying circumstances, allow the initiation of any of these types of combat, which location, target position and/or colony, and type must be specified in the Regular Turn Actions (except Initiate Combat), along with all participating attacking units. Additionally, first round combat orders must be included.

- **99 Luft Balloons:** Ship Combats are between ships of at least two sides in *system space*; at least one participant in a Ship Combat must be able to initiate combat in system space. These are the classic naval combats from short skirmishes, ship duels, to great fleet battles. A Ship Combat is not a direct attack on any colony, thus Defense Bases may not participate in a Ship Combat, but some units (e.g., Fighters<sup>10</sup>) based on colonies may initiate or join Ship Combat. A Ship Combat ends when all of the units of one or both sides have been destroyed or have retreated (this could occur simultaneously in some instances).
  - ✓ During Ship Combats, each ship uses its own Epistemological Constructural Element status to determine whether or not it can receive the effects of Enlightenment during the combat (see Skool Tyme, 2 Constructural Elements, p. 190, *supra*). This may have the effect of reducing the use of Enlightenment as applicable during the combat

and/or channeling application of Enlightenment to certain units (which will perform better or even heroically).

See definition of warship discussion, Warships, 1 Combat, p. 941, *supra*. Per the previous discussion in The FTL Missile, 2 Movement, p. 849, *supra*, ships in interstellar flight (FTL) cannot be affected, and combat cannot occur during FTL or in interstellar space. Thus, Ship Combats are only fought in system space.

- ✓ All Fighters in GGDM are assumed to be both space fighters and atmospheric fighters (like in most science-fiction television and movies), see Fighters, 1 Carriers & Fighters, p. 1046, *infra*.
  - ✓ Losing a Ship Combat in a system where there is a colony is a Disruption Event at the colony, see Burning Sky, 2 Disruption, p. 275, *supra*.
- **Panic Bells, It's Red Alert:** Units which were victorious in a Ship Combat may immediately initiate an attack of any available type against any colony in the same system unless warships remain in the *system space* that belong to the owner of that colony. A Colony Combat may never be initiated if the colony's owner has warships in the system, *unless all of those warships are currently engaged in other Combats*. The attacker also must have at least one remaining unit that is capable of initiating combat. This follow-through Colony Combat does not require a separate activation of the Combat Power for initiation, it is all the same operation. To attack other ships, however, would require a Combat Activation.
- ✓ Ships that successfully retreat from a Ship Combat must either retreat to a colony (and are located at the planet) or leave the starsystem, see Ship Zipped, 3 Combat, p. 982, *infra*. Other ships may remain in the system that did not join the Ship Combat.
  - ✓ While other alien warships in a system may pledge to defend any colony, for game purposes, only the ships belonging to the owner of the colony can be counted to stop the attack on the colony. If desired, other alien forces or arriving reinforcements can initiate combat against the colony attackers aiding the defense (or not).
- **Something Here from Somewhere Else:** Colony Combat is an attack on a colony by warships (or armed system boats from a tender starship or another colony) with the intent of damaging or subjugating the colony. Defense Bases may not initiate combat against warships. The Colony Combat ends when either the attackers have all retreated or been destroyed, or all colony defenses, except Ground Units (see GROPOS, 4 Combat, p. 985, *infra*) have retreated (i.e. ships) or been destroyed. The defenders in a Colony Combat have no retreat usually, Defense Bases in particular may never retreat, but defending Fighter Components and any ships (*ut infra*) may retreat from the Colony Combat; Fighter Complements may only retreat from a Ship Combat to the colony or a Carrier (thus, effectively, they may not retreat from a Colony Combat at their colony unless to a Carrier or another colony). The attacking warships may end the attack by retreating to system space.
- ✓ If a colony has at least one System Defense Base, *only* System Defense Bases and Colony Fighter Complements may be attacked in the first round of a Colony Combat, and *only* System Defense Bases and Colony Fighter Complements may return fire in the first round of a Colony Combat. System Defense Bases can be defeated in detail.
  - ✓ Ground Defense Bases may not fire until the second round of any Colony Combat, but may execute Close-in Defense fire against Missile and Fighter attacks on them.

They may only be attacked in the first round of a Colony Combat *if there are no Orbital or System Defense Bases*.

- ✓ During a Colony Combat, the status of the Epistemological Constructural Element of the *colony* is used to determine whether or not the colony's Defense Bases and Fighter Complement can benefit from Enlightenment (see Skool Tyme, 2 Constructural Elements, p. 190, *supra*) or NSF acting as Faculties (see The First is Last, 3 Colleges, p. 493, *supra*) during the combat. If the Colony Combat lasts to the next Regular Turn, the owner of the Colony may attempt to reactivate an inactive Epistemological Constructural Element at the colony by Cohering (see 5 Culture, p. 421, *supra*).
- In This Dust That Was a City: Orbital Bombardment is not really a combat, but is listed as a type of combat because it requires the *affirmative activation* of the Combat Power to initiate the ⚡bombardment. Orbital bombardment only lasts one Combat Round, there is no retreat option for either side, and each attacker only gets to fire once at the target planet. Orbital Bombardments may only be commenced on 1) colonies on which only Ground Units remain as defenders or on Conquered Colonies or 2) planets with no colonies. The intent is to kill the population *on the surface* of (i.e. 'de-infestation of the planet') and/or damage the *planet surface* (i.e. 'planet terraforming'). A planet may be Orbital Bombarded any number of times.
  - ✓ Orbital Bombardment Combat always ends after the first Combat Round with the 'retreat' of the attacking units. Orbital Bombardment may be initiated against the same colony multiple times in a Regular Turn by the same units with appropriate Combat Power activations. This is the only instance where a unit is allowed to initiate multiple combats in a Regular Turn when not a follow-on combat (*ut supra*).
  - ✓ Orbital Bombardment cannot be used for, and should not affect, Orbital Cities or any other Orbital Platforms or anything in orbit around the target planet; destruction of unprotected orbital targets can be accomplished by Ship Combat using the civilian target rules, 3 Combat, p. 978, *infra*, or by Strike Combat using Fighters or Ship Missiles, see World in Flames, 4 Carriers & Fighters, p. 1083, *infra*.

If the colony has any Defense Bases, System Boats or Fighter Complements, GGDM *assumes* that they will try to prevent Orbital Bombardment as an existential threat. The attacker would first be required to eliminate the colony's defenses by Ship Combat and/or Colony Combat before Orbital Bombardment.

After the wars, genocide, and pandemics of the 20<sup>th</sup> century, deaths of millions are no longer impressive to us (e.g., WWII – 75 million dead, 1918 Spanish Flu Pandemic – 17 to 50 million worldwide,<sup>11</sup> death toll of the first *two hours* of WWIII – about 300-500 million); science-fiction trope has moved onto billions of deaths and planetary destruction. The Concierge will adjudicate surface damages from Orbital Bombardment, but for guidance, each:

- ✓ 1<sup>st</sup> Era Warship involved will destroy 3 population factors,
- ✓ 2<sup>nd</sup> Era Warship involved will destroy 7 population factors, and
- ✓ 3<sup>rd</sup> Era Warship involved will destroy 12 population factors.
- ✓ Surface installations may be destroyed by Orbital Bombardment as well.
- ✓ There can be, probably will be, collateral damage to other colonies present on a Balkanized planet surface, in addition to environmental damage to the planet.

- ✓ The Maximum Habitability of the Planet will be reduced accordingly for all lost populations, and the Habitability Class will be reduced for (most) other positions by one class for every 20 population destroyed. Orbital Bombardment may trigger multiple Disruption Checks on the Conquered Colony, see Peaches for Mad Molly and Mars Bombing Run, 2 Disruption, pp. 273-274, *supra*.

Obviously, there is no need to commit Enlightenment to the ‘unenlightened’ Orbital Bombardment Combat, as there are no die rolls! ☺ Anyone seeing the planet in the future will be informed that it has been damaged by Orbital Bombardment (like moon craters). Ships that participate in Orbital Bombardment of any (regardless of Native Population Type) have a chance of *apostasy*, see Alieney Apostasy, 3 Disruption, p. 283, *supra*.

- ✓ “There was a time when people were impressed I had enough firepower to decimate a planet in under 10 minutes. I miss that.” – Rommie (sapient AI holographic ship avatar), Andromeda, “Point of the Spear” (2003).
- And Here Is A Red Balloon: Ground Combat and Colony Pacification Combat will be discussed in the next section. Raid/Strike Combat is discussed in 4 Carriers & Fighters, *supra*.

[After the alien mothership is hit by a nuclear weapon and crashes into the city...]

**Elaine:** *What... What is it?*

**Jarrold:** *They're not dead. They're just really, really pissed off.*

– Skyline (2010)

**The Bomb:** I’ll bet they are, but they (Elaine, Jarrod, and all the other humans in the apartment) should be dead from the nuclear blast (look up the atomic shadows of Hiroshima). Or they will be soon from the radiation if the aliens don’t get them first... They should be permanently blinded too since they were watching the attack (one of them through a telescope who was only temporarily blinded! – bad filmmaking), but that doesn’t matter if they are dead anyway.

Strictly for the purposes of initiating Orbital Bombardment, the Native Population Type on the target colony or Balkanized planet is irrelevant (thus, *apostasy* may be triggered by the Orbital Bombardment of *any* colony, see 3 Disruption, p. 283, *supra*). But here’s the Bomb:

- ✓ Orbital Bombardment of planets with Friendly or Naturalized Colonies will and must have major legitimacy ramifications, *even if they are not the target*. See previous “Supra-Legitimacy” discussions in Type 3 Fundamental Realities, 3 Beginnings, p. 42, Naturalization, 3 Order, p. 557-558, Meta Aspect, 4 Culture, p. 409, and Earthly Entanglement, 2 Government Titles, pp. 586-587, *supra*. The tough question to be answered is whether this will be accepted as a necessary and legitimate use of force?
- ✓ Or alternatively, under what circumstances is bombing your own population or enemy-occupied friendly areas a legitimate use of force? When is collateral damage and risk to your own colony acceptable in Orbital Bombardment of an **alien colony**?
- ✓ In modern combat, aerial and artillery bombardment of occupied areas is accepted as an unfortunate necessity, but what about more extreme situations, for example, would a government ever be justified in detonating a nuclear weapon on its own cities, as in the movies Independence Day (Houston) and Skyline (Los Angeles), or carpet bomb-

ing Manhattan with MOABs (Massive Ordnance Air Blast, aka Mother of All Bombs – that is, fuel bombs, aka ‘the poor man’s nuke’), as in the movie *Cloverfield* (the “Hammer-down Protocol”)? How about habitability damage to Balkanized worlds where a sovereign or Friendly colony is located?

- ✓ This question must be adjudicated by the Concierge within the context of the story and culture for each instance, with appropriate game solutions ranging from generation of an IP+ to difficulty in future naturalizations to loss of legitimacy of Government Titles and/or Diplomatic Spaces.<sup>12</sup> Such an act will not be soon forgotten.

The figures for damage from Orbital Bombardment are just figures for game convenience. They can be adjusted for whatever reason. Here is the real science:

- ✓ A meteor 60 miles wide hitting the Earth releases  $10^{31}$  Joules of energy, this is the apocalypse scenario for the Earth as the resulting shock and heat wave plus the burning debris thrown into the air would annihilate all life on Earth. The meteor that drove the dinosaurs to extinction was *only* 6 miles wide, and the flaming debris that rained down boiled the surface of the Earth.
  - “Asteroids have us in their sight. The dinosaurs didn’t have a space program, so they’re not here to talk about this problem. We are, and we have the power to do something about it. I don’t want to be the embarrassment of the galaxy, to have had the power to deflect an asteroid, and then not, and end up going extinct.” – Neil deGrasse Tyson.
  - See also Deflection Dilemma discussion, 2 Construction, p. 669, *supra*.
- ✓ The Chelyabinsk meteor, which struck in a less inhabited region of the globe in 2013, had an atmospheric impact force equal to a 400K explosion; the shockwave injured about 1,500 people and damaged many buildings; imagine if the impact had occurred in Western Europe, North Eastern United States or China, or the southern Indian or California coast? Or if it was just one of a rain of impacts in a small populated area?
- ✓ It is not difficult then to imagine the damage that could be done from space with mass drivers (nuclear weapons are not really necessary at that height) bombarding the planet, or by a starship that accidentally or intentionally collides with the planet at high speed. Or by an errant shot in combat or Raid on the wrong target. When science-fiction writers occasionally use this theme, they are not exaggerating the dangers.
- ✓ The figures used here were taken from “An Asteroid Will Not Destroy the Earth Today,” by Angela Fritz, atmospheric scientist, writing for the Washington Post, April 19, 2017 and Wikipedia article, “Chelyabinsk meteor,” captured February 9, 2018. Mass driver bombardment was introduced to television sci-fi by *Babylon 5* TV series.

Whether colonies on Balkanized planet surfaces can be bombarded without damaging others is a question to be adjudicated by participants based on the technology used and other factors, such as whether the planet is near Maximum Habitability; reduction in Habitability Class could affect other non-targeted colonies on the planet. Once the rule is established for the game, others can do the same. For example, the ‘clean’ destruction of Moscow by the alternate universe Daniel Jackson in the *Stargate SG-1* episode “Absolute Power” (2001) the relevant part of which is feature quoted at the end of 3 Combat, p. 983, *supra*, using Earth’s new orbital defense system.

---

*“The security dilemma refers to two related ideas. The first is very simple: Things that one state does to make itself more secure typically have the effect of making other states less secure. ... The second is about how this fact could lead states whose leaders are both basically interested in maintaining a non-conflict status quo to end up in a very costly war.”*

– James D. Fearon, “The Big Problem with North Korea isn’t that we can’t trust them. It’s that they can’t trust us,” Washington Post, August 16, 2017

---

*“Yet, there is a point at which hope must give in to logic. If we believe that Kim is undeterrable without such a strike, how can we also believe that a strike will deter him from responding in kind? And if Kim is unpredictable, impulsive and bordering on irrational, how can we control the escalation ladder, which is premised on an adversary’s rational understanding of signals and deterrence?”*

– Victor Cha, “Giving North Korea a ‘bloody nose’ carries a huge risk to Americans,” Washington Post, January 30, 2018

---

**Slamfire:**<sup>13</sup> The first round of Ship Combat in GGDM is the most important and most combats will end in the first or second round. Logistics – Operational Supply Limitation (OSL) and Log Ships – will be a major consideration early in the game, and possibly for much of the game. Most ship combats will be skirmishes or hit-and-run; cost, position development, and race survival will make positions careful about committing their major fleets early. The defender in a supported system generally has the logistical advantage, the attacker needs to overwhelm with the tactical-numerical advantage in the first round. Thus, both sides will launch just about everything they have in the first exchange. The defender often wins if they survive the first round.

- **Will to Kill:** The “political and psychological means to wage war” (from Gen. Vo Nguyen Giap feature quote in 3 Combat, p. 972, *infra*) in GGDM terms translates to the *ability and willingness* to commit Acts and Scenes, and Faculties, and to use Combat Power activations every Regular Turn, sometimes multiple Combat Power Activations per turn. This separates from the economic and material means to wage war, which requires ship building output, RPs, industrial output, and technology. A side may have material and/or technological superiority and an excellent support economy and infrastructure, but not be willing to divert or derail other processes to engage in a prolonged period of Combat Power Activations, and commitment of valuable Faculties, Acts and Scenes to combats.
- 

*“After the fall of Tǎrnovo to the Ottoman Turks in 1393, a number of Bulgarian clergymen sought shelter in the Russian lands and transferred the idea of the Third Rome there, which eventually resurfaced in Tver, during the reign of Boris of Tver, when the monk Foma (Thomas) of Tver had written The Eulogy of the Pious Grand Prince Boris Alexandrovich in 1453.*

---

*Within decades after the capture of Constantinople by Mehmed II of the Ottoman Empire on 29 May 1453, some Eastern Orthodox people were nominating Moscow as the 'Third Rome,' or the 'New Rome.' Stirrings of this sentiment began during the reign of Ivan III of Russia, who styled himself Czar (cf. Caesar), who had married Sophia Paleologue. Sophia was a niece of Constantine XI, the last Byzantine emperor. By the rules and laws of inheritance followed by most European monarchies of the time, Ivan could claim that he and his offspring were heirs of the fallen Empire, but the Roman traditions of the empire had never recognized automatic inheritance of the Imperial office.*

*It was also Sophia's brother, Andreas Palaiologos, who held the rights of succession to the Byzantine throne. Andreas died in 1502, having sold his titles and royal and imperial rights to Ferdinand II of Aragon and Isabella I of Castile. A stronger claim was based on religious symbolism. The Orthodox faith was central to Byzantine notions of their identity and what distinguished them from 'barbarians.' Vladimir the Great had converted Kievan Rus' to Orthodoxy in 988, in return for which he became the first barbarian to ever get an Imperial princess as a wife."*

– from Wikipedia article, "Third Rome," captured August 9, 2019

**Inglorious Ends:** The fate of Emperor Constantine XI is unknown, but he never resurfaced after the fall of Constantinople. There are no eyewitness accounts of his death, capture or flight, but he was seen fighting on the landside walls with the soldiers. He had no children, no direct heirs.

- ✓ Andreas Palaiologos sold his rights to the crown of the Eastern Roman Empire in 1494 and died in poverty in Rome in 1502 (he also came to Moscow twice before to beg money from his sister, Sophia Zoe, wife of Tsar Ivan III). Their father, Thomas Palaiologos claimed to be the Byzantine Emperor from 1460-1465 when he died in exile in Italy. Old ruling dynasties never end well.
- ✓ See Bulwark of the Past, 2 Eras, p. 773, *supra*.<sup>14</sup>

**Winning Smart:** In the year 234 C.E., Shu Han commander, Zhuge Liang moved against the Kingdom of Wei after three years of preparation. Wei commander Sima Yi, who had also been preparing for his army to remain in the field for a long time, paying special attention to food supplies, took up a strong defensive position on the Wei River on the Wuzhang Plains. The confrontation turned into a long stalemate; Sima Yi refused to be drawn out, while Zhuge Liang would not attack. As the summer months wore on, the Shu Han army began to suffer from lack of food and disease and demoralization; eventually, Zhuge Liang died in his camp (age 53). The invading Shu army thereafter retreated back to their capital with their commander's body; they had been defeated almost without a fight and began to fight among themselves.

- ✓ Source, R.G. Grant, 1001 Battles that Changed the Course of World History, p. 88.

Over 1,200 years later, in early October 1480 A.D., the Tartar leader Akhmat Khan approached a Muscovy army deployed along the Ugra River blocking their way to Moscow. For several days of running skirmishes, the Tartar army tried to cross the river in several places, but were in each instance successfully blocked by the Muscovites. The Muscovites were on the defense, across a

wide river and had more guns, the Tartars were light and very mobile horse-archers, but their arrows could not effectively reach the other bank. The two armies settled down into a stand-off. Ivan III opened negotiations with Akhmat, but only to buy time for more Muscovy forces to reach the area; Akhmat did not receive any more forces during that time, the Crimean Tartars did not come as promised, and the Tartar force was being harassed in the rear.

At some point, Akhmat tried to steal a march and cross far down river at night, but was blocked again. As winter approached, with the threat of the river freezing over, the Muscovites retreated to a high-ground position overlooking the river and the road to Moscow. However, Akhmat's army was then in no condition to cross and advance on Moscow, would not have been effective in assaulting the Muscovite hilltop encampment, and could not have bypassed them leaving an enemy army in the rear. Arriving late in the season, Akhmat was presented with a problem he could not solve for a month and a half, with the types of forces available to him; running out of supplies, on November 28, 1480 A.D., the Tartars retreated. Akhmat was killed the next spring in an attack by another Horde; Moscow was free.

- ✓ From Wikipedia article, "Great stand on the Ugra river," December 10, 2018.
- ✓ The Stand on the Ugra River (and the rise of Ivan III) is portrayed in the first season of the 2017 Russian-language series *Sophia* (available with English subtitles).

---

*"Those skilled in defense hide in the deepest depths of the earth, those skilled in attack maneuver in the highest heights of the sky. Therefore they can preserve themselves and achieve complete victory."*

– Sun Tzu, [The Art of War: the Demna Translation](#), p. xviii (Trans. by Thomas Cleary) (2002) <sup>15</sup>

## Endnotes.

<sup>1</sup> Commentary: For example, radar gunnery was a huge advance of WWII; specifically, it eliminated the need to manually observe shell splashes and adjust salvos for range, instead, radar could track shells in flight, and provide accurate ranges. The USS California, damaged at Pearl Harbor, was one of six ships to receive radar in 1940, but due to the damage, the ship was essentially rebuilt and reentered service in early 1944 as a new ship with the latest improvements in fire-control and radar. The Imperial Japanese Navy generally lacked radar gunnery on their ships.

<sup>2</sup> Commentary: I recall that in the War of 1812, some stiff-necked Brits complained in the press that U.S. 40-gun frigates actually had 44 guns (e.g., the USS *Constitution* and five others which also had heavier guns), due to two extra guns in the front and back. They were implying that the Americans were 'cheating' in some way. New American heavy frigates outmatched British 5<sup>th</sup> Rate Frigates with 38 guns of lighter caliber and smaller crews and generally caused problems for the blockade. The British navy suffered major defeats and loss of prestige during the war.

- ✓ This was – more or less – the same sort of claim made by the British after their defeat by the Scots at the Battle of Stirling Bridge (1297) in which, at some point in the battle, the wooden bridge collapsed cutting the English army in two on both sides of the river. No one knows why the bridge collapsed or exactly when, Blind Henry's account is the main one of fiction, which some mistake for history. The bridge may have been destroyed by the British to prevent the Scots pursuit, it may have collapsed from the weight, but the English made great propaganda out of claiming that the Scots sabotaged the bridge; but more importantly, in the late chivalric age, the English claimed that the 'barbaric' Scots had won 'unfairly' because they attacked before the whole English army had crossed and formed up for battle! Humph! And all that.

<sup>3</sup> Citation: Information from R.G. Grant, 1001 Battles that Changed the Course of World History, pp. 568, 578 and Wikipedia article, "Battle of Navarino," June 21, 2018.

<sup>4</sup> Citation: “The lessons taught by Tsushima gave rise to the most feverish decade of naval construction history. Immediately afterwards the British *Dreadnought* lent its name to the new era of the all-big-gun battleship designed for speed as well as terrific striking power. Of 17,900 tons displacement and 490 feet in length, the vessels of this class were driven by turbine machinery of 23,000 horsepower developing a speed of 21 knots. The armament consisted of ten 12-inch guns in five turrets, supplemented by twenty-four 12-pounders distributed over the ship for defense against torpedo boats.

Even these formidable specifications did not satisfy, and the *Iron Duke* class of super-dreadnoughts introduced ten 13.5-inch rifles with twelve 6-inch guns as secondary armament. The length was increased to 580 feet and the displacement to 25,000 tons. As a more radical departure came the *Queen Elisabeth* class, begun in 1912 and completed after the outbreak of war. These five battleships used fuel oil to develop a speed of 25 knots from 75,000 horsepower. The armor belt had a maximum thickness of 13 inches, and 15-inch guns appeared for the first time in the main armament.

A range of 4,000 yards had been considered long at Tsushima, but these giants could hurl their tons of armor-piercing projectiles five times that distance. Meanwhile the stealthy and prowling enemies of the battleship had likewise grown more deadly. By 1914 the torpedo boat had been largely superseded by the destroyer making 40 knots and carrying six torpedoes capable of sinking a ship five miles away. Submarines had been developed with a greater cruising radius, so that they could lie in wait on cargo routes or sow miles of a vastly increased explosive force in enemy waters.

Nor had the cruiser lagged in the world-wide armament race. The British Committee on Designs which planned the *Dreadnought* also recommended a new type known as the ‘battle cruiser’ which had more speed and striking power than the battleships of a few months before. Although the number of guns and thickness of armor were reduced in the interests of mobility, the *Princess Royal* class of 1910 carried eight 13.5-inch rifles in addition to an anti-torpedo-boat armament of 4-inch guns. In 1912 the *Tiger* class burned fuel oil as well as coal, and the experience of 1914 led to the *Renown* and *Repulse*, making 32 knots and carrying 15-inch guns.

After a decade of such technological advances, Tsushima seemed almost as outdated as Trafalgar. For no admiral in the world could pretend to know all the tactical possibilities of the new naval monsters.” – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), pp. 712-713.

- ✓ Cf. The USS Enterprise (CVN-65) commissioned in 1960 was 93,000 tons, over 1,200 feet long, and had a speed of 33.6 knots, only slightly faster than a WWI British battlecruiser and slower than a WWI destroyer, but BIG and nuclear powered.
- ✓ The USS Gerald R. Ford (CVN-78), commissioned in 2013, is considered the largest aircraft carrier in the world, at 100,000 tons, with two nuclear power plants that have 250% the output of those on the Nimitz Class, it runs at about 1,100 feet long and over 30 knots (actual top speed is surely classified information).

<sup>5</sup> Commentary & Citation: One of the most amusing scenes of the original Battlestar Galactica series was the eye-popping moment when the cocksure Commandant Leiter’s Eastern Alliance destroyer encountered the Galactica (BSG:OS “Greetings from Earth”). The space-going neo-Nazi Eastern Alliance assumed that they were the superior military power in the galaxy until the Galactica encounter, which was not only far more technologically advanced, but also was enormous, such that the Alliance destroyer was set down inside the Galactica’s Viper landing bay.

<sup>6</sup> Commentary: Oddly, it has been reported that the Japanese on the main island heard radio traffic from the attack on Pearl Harbor, which is at least a highly improbable (and perhaps ominous) occurrence. Schumann resonances?

<sup>7</sup> Commentary & Citation: Not all enemies are aliens, as we well know: “We have met the enemy and he is us.” – Pogo Comic Strip, Earth Day 1971, by Walt Kelly.

<sup>8</sup> Commentary: George Oliver Smith wrote a series of short stories between 1942 and 1945 about a Venus Equilateral Relay Station, 3 miles long, located at the L4 point to relay messages from Earth, Venus and Mars to their intended recipients whenever the planets were on opposite sides of the sun, exhibiting a rare understanding of orbital mechanics.

<sup>9</sup> Commentary: In this case (conceding that it is a historical drama), the ‘artillery school’ in Edo was for the pre-Meiji Japanese a sort of Technology Power College rather than Weapons College or Combat College. The dialogue

represents to the viewers in condensed form the coming Meiji Restoration regime's approach to Japan's problem and the fear of change, of disorder, the lack of answers, the seed of what ended the Tokugawa Shogunate.

- ✓ Not coincidentally, building forts along the coast and arming them with modern cannon was China's strategy that led to defeat in both Opium Wars, the second one disastrously. The dialogue thus may have a second layer of meaning – a poke in the eye – in the context of the history between China and Japan.

<sup>10</sup> Citation: “No. Try not. Do or do not. There is no try.” – Yoda, *Star Wars: The Empire Strikes Back* (1980) (you know this scene already).

<sup>11</sup> Citation: “As recently as March 24, only a week earlier, the president was equating covid-19, the disease caused by the coronavirus, to the flu: ‘We lose thousands of people a year to the flu. We never turn the country off.’

Or as he put it on Feb. 26: ‘This is a flu. This is like a flu. ... It’s a little bit different, but in some ways it’s easier, and in some ways it’s a little bit tougher.’

Similarly, on March 9, in a tweet: ‘So last year 37,000 Americans died from the common Flu. It averages between 27,000 and 70,000 per year. Nothing is shut down, life & the economy go on. At this moment there are 546 confirmed cases of CoronaVirus, with 22 deaths. Think about that!’

At the very least, Trump's consistent effort over many weeks to portray covid-19 as a type of flu could have created a feedback loop. Trump has the world's biggest megaphone, and his friends may have been regurgitating his message.” – Glenn Kessler and Salvador Rizzo, “Fact-checking President Trump's marathon news conference,” *Washington Post*, April 2, 2020.

<sup>12</sup> Commentary: There is no Conflict Check which reads “(T) Position has not initiated Orbital Bombardment against its own colonies while this Title has been active” (or at any point in the game). That would be too easy, see *Won't Get Fooled Again* commentary in 4 Government Titles, p. 633, *supra*. And bombarding your own people is something beyond a legitimacy question. Sid Barre, the dictator of Somalia, bombed the city of Hargeisa, Somalia (and other areas) containing about 750,000 population, in 1988 because it was a stronghold of and sympathetic to the Somali National Movement. He fled the outbreak of the Somali Civil War in 1991 in a tank, and into exile where he died 4 years later.

<sup>13</sup> Commentary: Slamfire is a weapons design issue where the weapon can continuously discharge until the ammunition is exhausted, caused by the inertial force of the firing pin hitting the primer as the round is loaded by automatic forward bolt action. It is not the same as a cook-off, which is caused by excessive heat causing the round to fire.

<sup>14</sup> Commentary: “Inglorious Ends” could also (tongue in cheek) describe the sinking of the HMS *Glorious* along with both destroyer escorts by two German battleships armed with 11” guns in June 1940. The *Glorious*, *en-route* to England from Norway, had no CAP and no aircraft ready on deck when the German ships surprised them; a shell penetrated the flight deck igniting an aircraft fuel explosion below. This is only one of two instances where an aircraft carrier (CV) was sunk by gunfire from a battleship (BB) since 1939, the other being the *Battle Off Samar* in 1944, when a force led by the *Yamato* surprised American carriers and destroyers, sinking two of six escort carriers.

<sup>15</sup> Citation: cf. “Those who excel at defense bury themselves away below the lowest depths of the Earth. Those who excel at offense move from above the greatest heights of Heaven. Thus they are able to preserve themselves and attain complete victory.” – Sun Tzu, *The Art of War*, p. 183 (Trans. by Ralph D. Sawyer) (1994).

*“Quantum mechanics is certainly imposing. But an inner voice tells me that it is not yet the real thing. The theory says a lot, but does not really bring us any closer to the secret of the ‘old one.’ I, at any rate, am convinced that He does not throw dice.” – Albert Einstein*

**Making Everyone Happy:** Robert Heinlein cleverly created an explanation that would make both empirical scientist and Biblical literalist correct at the same moment. It allowed him to avoid taking sides. But Yahweh doesn’t come out looking good in it.

- ✓ **Rahab:** But notice carefully what I did say. I did not say that the world was created twenty-three billion years ago; I said that was its age. It was created old. Created with fossils in the ground and craters on the moon, all speaking of great age. Created that way by Yahweh, because it amused Him to do so. One of those scientists said, ‘God does not roll dice with the universe.’ Unfortunately not true. Yahweh rolls loaded dice with His universe... to deceive His creatures.

**Alex:** Why would He do that?

**Rahab:** Lucifer says that it is because He is a poor Artist, the sort who is always changing his mind and scraping the canvas. And a practical joker. But I’m really not entitled to an opinion; I’m not at that level. And Lucifer is prejudiced where His Brother is concerned; I think that is obvious. – Robert Heinlein, Job: A Comedy of Justice (1984).<sup>1</sup>

- **Will’s God:** “Every man who wages war thinks God is on his side, and often I warrant God should often wonder who is on his.” – Oliver Cromwell, Cromwell (1970). If you attribute your victories to God’s will, to what agency do you then attribute your defeats? Your defeats are either God’s will or not; if they are not God’s will, then another agency exists that is at least as powerful as your God and it’s not on your side. Either way, you cannot do anything about it. Or perhaps you think that as long as God is on your side, you cannot be defeated? What does it mean then when you were defeated? That your god is fickle? This is why God has no place in military thinking.
  - ✓ “Chestov is quoted as saying: ‘We address ourselves to God only to obtain the impossible; as to the possible, humans suffice.’” – Erich Kahler, The Tower and the Abyss (1957) quoting Albert Camus quoting Lev Shestov (Chestov).

**Basic Combat Procedure:** Combat is resolved in rounds. During each round, each side in the combat gets their chance to either attack the enemy or retreat from the combat (if possible). All attacks and defenses in a Combat Round are considered to be occurring *simultaneously* for resolution purposes (not IGO-UGO), although in practice, each is resolved separately. As outlined in *Relativity, 3 Streams of Time*, p. 85, *supra*, Combat occurs and proceeds independently of the progress of the rest of the game; that is, the rest of the game does not stop for Combat; any number of Regular Turns and Turn Cycles, may be resolved during the course of a combat, or even a single Combat Round if the combatants are being dilatory. Forces involved in combat may not do anything else during Regular Turns until either they win or they retreat from the combat.

- ✓ Enemy unit has nothing to do with diplomacy; enemy unit is the one shooting at you.
- **Trading in Fire:** ‘Simultaneous’ combat resolution means that all units on both sides will execute their attacks or attempt other actions, even if they are destroyed during the Combat Round, and that all destroyed units are removed at the *end* of the Combat Round.

- Attackers & Defenders: The side that initiates the combat is the attacker and the poor, hapless victim of the aggression is the defender.<sup>2</sup> In the rare instance, due to the continuous Turn Cycle of the game, that both positions initiate combat on the same date in the same place against each other via appropriate Combat Power activation, the position that submitted Actions first is the attacker. Any number of positions may participate in any combat; additional forces and positions may arrive during the course of the combat (during Regular Turns) as well, and join the ongoing combat. Each force and/or position joining a combat at any subsequent point, 1) must be capable of initiating combat and 2) must do so by proper activation of the Combat Power. Any side initiating combat *must* submit Combat Orders concurrently or the combat will not be initiated (but Acts and Scenes will still be consumed).

This requirement is for the purpose of game progress. You are either doing it or not. There should be no ‘Phoney War’ or ‘sitzkrieg’ where combat is initiated and nothing happens immediately.

- ✓ There are only two possibilities, either a position is an attacker or a defender. If a position initiates combat against another, they are considered an attacker for GGDM purposes, regardless of when this occurs, who they help or hurt, or what they subsequently do (or who is blamed for the combat). All units belonging to a position involved in a combat share the same designation.
  - ✓ For example, A attacks B, initiating combat via activation of the Combat Power. Therefore A is the Attacker and B is the Defender. After the first Combat Round, a Regular Turn is processed and C arrives via Combat Movement and initiates combat against A and/or B, because C initiated combat, C is also an Attacker and/or A and B are Defenders *as to C*.
  - ✓ Attacker/Defender relationships only exist as to pairings of combatants; in multiparty combats, a side may have different designations as to different opponents. This is important for the Seize the Initiative Combat Power activation, below.
- Capoeira: Each Combat Round, each side must submit Combat Orders to the Concierge. The Combat Round will be resolved when all Combat Orders are received, with two exceptions noted below. When the Concierge receives *any* combatant’s Orders, all other participants in the combat will be asked to submit Combat Orders within one day (24 hours) of the time the Combat Orders were received.
- ✓ If the Concierge does not *timely* receive a defender’s Combat Orders on the *first round* of a Combat, the attacker’s Combat Orders will be executed and the defending forces will attempt to retreat, if possible. Any position initiating combat must send appropriate Combat Orders with the combat initiation notice or Regular Turn Actions.
    - If the defender cannot retreat or does not successfully retreat, the defender will be given an opportunity each Combat Round to submit orders. If no orders are received, the above procedure will be repeated (the Defender who cannot retreat will simply get pummeled) until all Defending units are destroyed or retreat, or until the attacker retreats ending the combat.
  - ✓ If the Concierge does not timely receive a defender’s Combat Orders but has received at least one set previously, the last Orders received for the defender will be repeated to the extent possible. The Concierge will not alter the Orders.

- Thus, the defender cannot hold up the combat by refusing to submit orders. These exceptions, paired with the Seize the Initiative activation (*ut infra*) insure that most combats efficiently proceed to resolution while also leaving the players with some flexibility as to timing of Combat Rounds and Regular Turn processing.
- Seize the Initiative: Generally speaking, the attacker drives the combat; if the attacker is not attacking, the defender does not need to defend (*ut supra*).<sup>3</sup> Seize the Initiative allows the defender to flip the tables on a dilatory attacker:

Imagine a game of Chess, or of Checkers. On your turn, you must move a piece. No matter what you think of your current position, you must move a piece, there is no rule that allows a pass, and the mechanics of the games generally would not allow ‘not moving.’ People don’t think about it, we assume it to be the (usually) unspoken rule of any game. Even in multi-player games, such as Monopoly – where there are definitely times when you don’t want to move – when it is your turn, you must shake the dice and pay the man his money. GGDM is more forgiving in that way, if you don’t want to take your turn, or your round, fine, but the game universe (like life) moves on without you, unless you are impeding the progress of combat resolution (akin to impeding an ambulance with sirens blaring).

- ✓ If at the time the defender’s next Regular Turn actions are *received* by the Concierge, an attacker in an ongoing combat has not submitted Combat Orders for three days, the defender in the combat pairing may choose to ***become the attacker*** by activating the Combat Power for the purpose of Seize the Initiative, if the defending forces are capable of initiating combat (i.e. Defense Bases cannot chase enemy warships). The previous attacker is now the defender.
  - Combat Orders must be submitted with the Regular Turn actions to Seize the Initiative (as if initiating combat, *ut supra*); Seize the Initiative can only be done by Combat Power activation on a Regular Turn.
  - Fighter Complements based on a colony are capable of initiating combat and thus may Seize the Initiative for their side.
- ✓ When the defender becomes the attacker by Seizing the Initiative, that Combat Round is treated as if it were the first round of combat, *ut supra*.
- ✓ Because the combatant forces are already locked in combat and cannot do anything else until someone either wins or retreats, Seize the Initiative only requires expenditure of one Act by the defender, and serves to prevent dilatory tactics<sup>4</sup> and inferior attacking forces from pinning down superior defending forces by not submitting Combat Orders.
- ✓ A Combat Power activation to Seize the Initiative ***never*** (in any context) requires a check to see if the Power Activation is obeyed.
  - The three-day period for the attacker to submit Combat Orders is based on the idealistic time periods for the continuous action of the game presented in Three Daze, 2 The Streams of Time, p. 84, *supra*. It may or may not need to be adjusted if the periods for submitting Regular Turns are extended to accommodate real world schedules.

It is possible for a Colony Combat to go stagnate if the defenders only have Defense Bases and the attacker is not attacking. This becomes a siege (see *Besieged Colonies*, 3 The Side-real Stage, p. 124, *supra*). This situation is not bothersome to the GGDM combat rules because *only the attacker is being inconvenienced by their own inaction*; the defenders are not going anywhere because they are immobile defense bases. See also *Blockade Running*, 4 Commerce, p. 1233, *infra*.

*“The enemy will pass slowly from the offensive to the defensive. The blitzkrieg will transform itself into a war of long duration. Thus, the enemy will be caught in a dilemma: He has to drag out the war in order to win it and does not possess, on the other hand, the psychological and political means to fight a long-drawn-out war.”*

– Gen. Vo Nguyen Giap, Commander, People’s Army of North Vietnam

**Keep Your Friends Close, Your Enemies Closer:** Care should be taken against whom combat is initiated, a side may only issue orders to fire at 1) units involved in the combat, 2) belonging to positions against whom they have initiated combat *or* who have initiated combat against them. Combat initiation is between positions, not individual participating units. The position first initiating combat, the attacker, designates the type of combat and the participants – the attacking units, and the targets of the attack.

- ✓ So, if C (in the example above) initiates combat against B only, C cannot fire at A and A cannot fire at C, unless one of them later initiates combat against the other by activation of the Combat Power.

This may seem terribly unfair to the defenders, but it is not inaccurate historically (e.g., WWII was created by the aggressors); the one who starts the fight has control initially of the scope and theatre of the contest. For example, Germany invaded Poland in September 1939, the Soviets invaded Poland a couple of weeks later. Less than two years later in June 1941, the Germans invaded the Soviet Union. German actions created the Eastern Front in WWII; many alternate histories have explored what happens if there was no invasion of USSR.

The defender has options in GGDM that can frustrate the attacker, including attempting retreat on the first round, adding new forces, initiating new combats, or other options to shift the scope and theatre of the contest.

A combat is conceptually a lethal struggle between a set of units in a particular theatre or sphere of operation described by the Combat Type. Thus, Combat Type may be alternately defined as the theatre of operations of the combat, i.e. system space, orbital space, planet surface, corresponding to Ship Combat, Colony Combat, and Ground Combat.

- **Targeting Unit:** The attacker may only initiate combat against units. Pursuant to the discussion in *View from a Height*, 1 Construction, p. 660, *supra*, the units of the game are ships (and system boats) and colonies; thus, there is Ship Combat and Colony Combat. Thus, an attacker cannot initiate a Colony Combat against some of the colony’s Defense Bases and exclude others, as Defense Bases are *enhancements* to the Colony unit (combat in GGDM is between game units). Alternatively, as discussed below, the colony would simply voluntarily join any excluded Defense Bases with their first Combat Round orders.<sup>5</sup>

- ✓ Generally, a combatant can only target (or join) units appropriate to the Combat Type being fought (and each ongoing Combat may be of only one type), thus Ground Units (introduced in 4 Combat, *infra*) cannot be targeted by or joined to a Ship or Colony Combat. It is possible however, for ships and non-Ground Bases to join a Ground Combat if they are at the planet, for the limited purpose of supplying Ground Units (i.e. Log Ships), landing units, or for fire support. They must successfully retreat to exit the combat (*ut infra*, p. 980) before taking any Regular Turn Actions.
  - ✓ Ships that have retreated to the colony previously from a Ship Combat (*ut infra*) may join or be targeted as part of a Colony Combat (therefore they might as well join), and the forces attacking the colony receive one Offensive Shift (*ut infra*) against ships participating in or sheltering at the colony during a Colony Combat.
- **Those Who Stand Looking:** During any combat, there may be other units present that are not part of the combat or involved in the combat, for example, they may be waiting just out of range to do their part or watching from a distance, avoiding being hit. Units which are not involved in a combat may not be targeted by participants (*ut supra*). Thus transports loaded with Ground Units, Carriers with Fighter Complements, Cargo Ships waiting to loot, or Colony Ships waiting to Land or Unload, may be held out of a Colony Combat, but if so, a Combat Power activation will be required for them to initiate any new separate combat. As noted in Move Out! and DefCon 1, 1 Combat, pp. 942, 946, respectively, *supra*, new units arriving via Combat Movement or units on Combat Alert may initiate combat and all friendly units present may automatically join them.
- **Rule 20 Permissive Joinder:** Any participant may voluntarily join (i.e. feed) available eligible friendly units present into an ongoing combat at the beginning of any Combat Round ***after the first*** and those units may fire at the enemy or take other actions, immediately. Joining a combat *does not require a Combat Power to initiate combat* but units joining an ongoing combat must either be able to initiate combat, or must be Logistical Ships, and must be able to join the type of combat that is in progress (i.e. must be able to fight in that sphere, theatre). Since there is no Power Activation, no check is made to see if the units obey.
- ✓ **However**, the attacker in a Colony Combat against a colony that has one or more System Defense Bases may choose to initiate combat (normally or as a follow-on) against only the System Bases. The defender may only join Fighter Complements, and any warships or armed System Boats sheltering at the colony (following a retreat). The attacker is not allowed to involuntarily join any Orbital or Ground Bases by attacking them. On the other hand, if the attacker destroys all of the System Bases, there is no follow-on option against the rest of the colony defenses, rather, a separate Power Activation is required to initiate combat against the remaining defenses, even if that is in the form of other units arriving by Combat Movement afterward.
  - ✓ Tender starships carrying armed System Boats that join a combat should, like a Carrier with Fighter Complements, be considered to join the combat even though a Tender Ship cannot itself initiate combat, it must come close enough to launch the armed System Boats and stay close enough to gather them in later. The Tender Ship may also be considered to be providing sensor and command support for the armed System Boats, and may retreat with or without the System Boats.

Units that join a combat may not do anything else until either they retreat successfully from the combat or the combat ends. There is no rule procedure, other than colony defense, to force uncommitted enemy units to join a combat, and they may not be fired upon. However, it is the nature of combat to draw in all available units.

This is, of course, a way to shoo units into a combat when they failed to obey the Combat Power activation to Initiate Combat (see 1 Combat, p. 944, *supra*). The cost is that they are not available on the first round, *which can be critical*. Though we would not now expect units to disobey an order to initiate combat, everyone knows that in combat, it tends to work this way, crap happens, units underperform or fail to reach battle, and that the first casualty of battle is ‘the plan’; there is some historical basis for this as well:

- ✓ “It required long months of drill to train a soldier for linear tactics, and every attempt to pit novices against regulars in formal battle had led to wild routs. In the end the recruits took matters into their own hands, fighting as best they could; and Carnot saw the germ of an ultimate decision in the ‘horde tactics’ scorned by a disciplined foe. Self-preservation is not a bad foundation for victory, and at Hondschoote most of the French forces showed a marked distaste for coming within range of enemy muskets. Only the more adventurous souls swarmed out in a ragged wave of skirmishers to take cover in ditches and behind hedges.

From such positions they peppered the long lines with a fire which left the enemy helpless. Return volleys were a waste of ammunition, and the, regulars advanced only to find that their opponents had scrambled back to new cover. Less valiant Frenchmen soon saw the advantages of a new military game which promised to be safe as well as interesting. They joined their comrades of the ditches and hedges until the allied casualties grew serious. When enough troops had plucked up courage, their officers ordered an advance; and the recruits surged forward in masses which by courtesy were called columns.” – Lynn Montross, *War Through the Ages* (3rd Ed., 1960), pp. 454-455.<sup>6</sup>

The victor of the Battle of Hondschoote was executed six months later during the Reign of Terror for cowardice in the face of the enemy despite his victory. His political sponsor had been executed before the battle and during the campaign and battle, the experienced general was overruled several times by Republican monitors, men of revolutionary fervor and extremist ideologies with no military experience and little training. The Republican monitors took his caution as cowardice, despite the victory and he was later tried and executed. This is a casebook example of how revolutionary ideologies and politics spin out of control and destroy the revolution from within.

- Ticky Tock Timing: Since the attacker must submit Combat Orders first and the defender has 24 hours to submit their Combat Orders (*ut supra*), units joining on the attacker’s side will be known to the defender, who may issue orders to fire at them.
  - ✓ The defender should not be able to see the attacker’s Combat Orders, as it may affect decisions to Combat Screen, Retreat, and/or Combat Resupply some units, however, the defender should be informed if additional unclocked or non-Temporal Ship (T-Ship) units have joined the battle, as those units will have approached normally. The only time a unit should be able to join the battle undetected (until it attacks) is if the unit is in Ambush Mode (see Ambush Combat, 7 Combat, p. 1036, *infra*).

On the other hand, friendly units joining the defender's side will not be attacked normally in the Combat Round they join and may get a 'free shot' at the enemy because they were not part of the combat when the attacker issued orders. This sucks for the attacker but is not entirely unrealistic (e.g., the Battle of Austerlitz, 1805).

- ✓ Units joining on the defender's side, however, can still be subject to Interception if they attack a unit that is Combat Screened (see 3 Carriers & Fighters, p. 1067 *et seq.*, *infra*), because the target of the Combat Screen is the unit being protected and interceptors take on whomever tries to attack the protected unit.

The defender is taking a risk intentionally holding out units until the second or third Combat Round so that they can join and get a free shot. Defense is usually an 'all hands on deck' event and units held out by the defender in the first Combat Round may not be targeted by the attacker, but also may not fire. Napoleon mastered this at Austerlitz in December 1805, he deliberately allowed his thinned lines to be pushed back in a slow fighting retreat to lure the enemy off Pratzen Heights; at the opportune moment, he launched an attack at the allied center with up to 20,000 French soldiers that had been hidden in a wooded ravine shrouded by heavy fog. The battle occurred on the 1<sup>st</sup> anniversary of his coronation as Emperor.

- **Victuals & Vitals:** Logistical Ships must join a combat in order to perform Combat Resupply (see 4 Movement, p. 868, *supra*). Additionally, any Log Ship that provides *Supplies* during a Regular Turn to units involved in an ongoing combat will automatically join the combat *unless* the Log Ship initiates interstellar movement in the same Regular Turn. Log Ships will have to perform a successful retreat to be able to move away. Log Ships are non-warships.
- **The Cavalry:** Units arriving by Combat Movement that join an existing combat do not change their side's designation in existing combat pairings. They may, however, initiate combat against other positions present, if appropriate, and if they are not already involved in combat with the arriving ships' owners (as in the example) or they may initiate new types of combat, as appropriate to the particular circumstances.
  - ✓ Continuing the above example, if the preceding combat is a Ship Combat, warships belonging to A arriving by Combat Movement, may join the existing multi-positional Ship Combat and A may or may not initiate combat against C. However, A could not initiate Ground Combat against a colony owned by D, if A did not bring any Ground Units as that would not be appropriate or possible.

---

**Spock:** *He is intelligent, but not experienced. His pattern indicates two-dimensional thinking.*

– Star Trek II: The Wrath of Khan (1982), "Battle of Mutara Nebula" (2285)

---

**Abstract Tactical System:** Gestalt-Genesis Day Million uses an "abstract tactical system" to resolve combat: A unit to unit combat system without a map.<sup>7</sup> In an abstract tactical system, there are no maps or hexes or grids, or movements, maneuvering, speed, or generally, weapons range; rather, the pieces of the sides are lined up and shoot at each other until one side is destroyed or runs away.

The basic abstract tactical system assumes that all units are capable of firing at any other enemy unit in each Combat Round and that units involved are capable of instantaneously closing to firing range in terms of the time period represented by each Combat Round (but this can be changed).

- ✓ Abstract tactical combat should not be envisioned to mean that modern armed units are just, ‘unrealistically,’ standing in a line shooting at each other like Redcoats (however, see next). That would be absurd. Misses in combat can be interpreted as being due to unit maneuvering, bad shooting, bad driving, bad training, being on drugs, marital disputes, prior damage, being distracted by glittering asteroids, avoiding collision with a moon, or just being out of range.

Abstract tactical combat is particularly suitable for three-dimensional space combat as it avoids the fallacies of fighting three-dimensional space combats on a two-dimensional, flat, tabletop game board (or the complexity of those systems that do simulate three-dimensional combat on a two-dimensional surface).<sup>8</sup> It is also suitable for this level of game where the point of the game is neither combat nor detailed tactical ship-to-ship combat simulation. That said, however, GGDM combat has unexpected depth and complexity for being abstract tactical.

- ✓ Who can forget the outlandish infantry EVA spacesuit, zero-G, above the Earth laser fight between the U.S. Marines from a space shuttle and the defense unit from orbital space station in the James Bond movie *Moonraker* (1979)? Yet, without maps, terrain, or hex or area movement, players might envision GGDM’s abstract tactical combat as being literally like the *Moonraker* infantry combat in space scene.
- **Forward Observation:** GGDM makes the assumption that, other than cloaking and T-ships (see *Ambush Combat* generally, 7 *Combat*, *infra*), all units in a system can be seen by everyone (see also, *One-Way Mirror*, 2 *Information*, p. 1340, *infra*). The assumption is that in-system, nearly-perfect detection abilities (see *Riding the T*, 3 *Temporal Technology*, p. 828, *supra*) are being used in GGDM. This issue is discussed in greater detail in 2 *Information* generally, *infra*. Recall also that units can execute *Interplanetary Movement* instantly (see 2 *Movement*, p. 844, *supra*), thus, within the time periods of GGDM, all units are in range.

---

*“There is only one tactical principle which is not subject to change. It is to use the means at hand to inflict the maximum amount of wound, death, and destruction on the enemy in the minimum amount of time.”*

– General George S. Patton Jr.

---

---

*“In every battle there comes a time when both sides consider themselves beaten; then he who continues the attack wins.”* – General Ulysses S. Grant

---

**Combat Resolution:** The Concierge resolves all Combat Orders. Each Combat Round, each unit involved in the combat may fire at an enemy unit, attempt to retreat, or do something else (as provided by the rules, read on); basically, in each Combat Round each unit may do one thing, unless otherwise provided. This can be improved, for example, by multi-targeting technology.

If a unit is ordered to do more actions than allowed, the first actions will be processed and all later actions ignored (necessary for game sanity purposes).

- ✓ This is contrary to U.S. Marine Corps training where we were told to follow your last lawful order; the person issuing the order would be responsible if they countermanded or interrupted execution of an order from a superior officer.
- ✓ “In the absence of orders, go find something and kill it.” – Field Marshall Erwin Rommel.

*Combat Orders will be resolved generally in the order provided*, within the framework of the combat rules; that is, all Fighter attacks are resolved first in the round and all Ship Missile attacks are resolved near the end of the round, before retreat attempts. Within each part, Fighter Attacks, the main combat, then the Ship Missile attacks, then the retreat attempts, the orders will be resolved in the exact order provided by the position. Combat Screening assignments on all sides, however, must be necessarily addressed before the first Fighter Attack is resolved.

- ✓ Since Engaged results can affect the later parts of the Combat Round, Fighter attacks for both sides must be resolved first, after Combat Screening assignments.
- ✓ As explained in *Blacksheep, 2 Carriers & Fighters*, p. 1054, *infra*, Fighter attacks are always resolved first in the Combat Round, therefore, it would not matter if they were placed last in the orders and Ship Missile attacks are always resolved last in the round (but before retreats) and it would not matter if they were placed first in the orders (see *First Fire, 4 Carriers & Fighters*, p. 1079, *infra*).

Enlightenment is assigned to the Combat, not Combat Round, so unused Enlightenment carries from Combat Round to the next Combat Round, until the end of the Combat when it is lost (see *Vampire Suicide and Army of Light, 2 Colleges*, pp. 478-479, *supra*). Enlightenment may be added at the beginning of any Combat Round, however, addition after the first Combat Round may lead to wastage. *Id.*

- ✓ The use of Enlightenment in combats may affect the order in which the side has its units perform actions; for example, it is possible to homogenize the odds of each unit hitting the enemy by having the units with less chance to hit fire first, thus allowing them to benefit from Enlightenment rerolls. This will likely use up Enlightenment before heavier units attack, though. However, as also noted in *Army of Light, 2 Colleges*, p. 479, *supra*, a side may choose not to use Enlightenment in Fighter attacks, and Enlightenment should not apply to Ship Missile attacks.
- ✓ Because retreats are processed last in the round, it is likely, unless the whole side is running away, that Enlightenment will remain to aid the units attempting to retreat.

This resolution of Combat Orders will proceed without interaction between the Concierge and players; this is necessary for batch processing, to keep the game moving along, no matter how many combats are running at any time. Thus, there are limited situations where the Concierge may make some decisions that affect the combat (e.g., see *Combat Screening, 3 Carriers & Fighters*, p. 1067, *infra*). The Concierge will necessarily inform both sides of the results of the Combat Round, but will not inform anyone not involved in the combat unless required, however others may detect that a combat is ongoing (e.g., see *ABBA Arrival and Private Eyes, 2 Information*, pp. 1340, 1342 respectively, *infra*).

- **Firing Solution:** The basic chance that any warship will be able to hit another unit in combat is 10%. The basic chance is multiplied by three for 1<sup>st</sup> Era Warships, by five for 2<sup>nd</sup> Era Warships, and by seven for 3<sup>rd</sup> Era Warships. So a 1<sup>st</sup> Era Warship has a 30% chance to hit, a 2<sup>nd</sup> Era Warship has a 50% chance to hit, and the 3<sup>rd</sup> Era Warship has a 70% chance to hit.
  - ✓ Ground Defense Bases have a basic 20% chance, times the current era of the colony's defense to hit, while Orbital and System Defense Bases have a basic 30% chance, times the current era of the colony's defenses, to hit. Partially completed Era Upgrades (see Colony Defense Era Upgrade, 2 Combat, p. 954, *supra*), count as the lower or last Era completed. In the 3<sup>rd</sup> Era, bases are more powerful than warships.
- **Combat Shifts:** These basic chances to hit may be adjusted by Combat Shifts to a maximum of 99% chance to hit. A Combat Shift either increases or decreases the chances of the attacking unit hitting the target by 10% per Shift. Shifts that increase the chances of a hit are called Offensive Shifts and shifts that decrease the chance of a hit are called Defensive Shifts.
  - ✓ A unit (including Defense Bases) of a higher Era firing at a target of a lower Era (including Defense Bases) receives one Offensive Shift for each Era difference between the firer and the target. Thus, a 3<sup>rd</sup> Era Warship has a 90% chance to hit a 1<sup>st</sup> Era Warship (i.e. basic chance plus two Offensive Shifts), an 80% chance to hit a 2<sup>nd</sup> Era Warship, and a 70% chance to hit a 3<sup>rd</sup> Era Warship (i.e. no shifts).
  - ✓ Conversely, equal Defensive Shifts of one shift per Era difference are applied if a lower Era unit is firing at a higher Era unit. For example, a 1<sup>st</sup> Era Warship has only a 10% (30% - 20%) chance of hitting a 3<sup>rd</sup> Era unit and a 3<sup>rd</sup> Era Warship has only a 60% chance of hitting a 4<sup>th</sup> Era Warship.

Combat Shifts are always applied individually between one attacker and one target in each combat instance (including Probing defensive fire, see Bloody Noses, 2 Information, p. 1346, *infra*), the same Offensive or Defensive Shifts can be applied to several attacks by or against the same unit in the same round and over several Combat Rounds.

- ✓ Heavily armored Orbital and System Defense Bases receive one Defensive Shift in the first combat round of a Colony Combat. Defensive Shifts tend to draw multiple fires in a round...
- ✓ Fighters on FAP assignments (combat reconnaissance) also provide friendly offensive and defensive Combat Shifts, see A FAP in the Night, 7 Combat, p. 1041, *infra*.
- **Civilian Targets:** The Era shifts also apply to non-warship targets: Scouts, Cargo Ships, Colony Ships, Orbital Shipyards, Orbital Cities. Non-warship targets are considered to be at the Era of the Patent that allowed their construction for Era shift purposes; all non-warship targets in the game are initially 1<sup>st</sup> Era. In addition to Era shifts, combat units shooting at a civilian target also receive two Offensive Shifts (because they are not really combat units).
  - ✓ For example, a 1<sup>st</sup> Era Warship or Orbital Defense Base attacking a 2<sup>nd</sup> Era Colony Transport, would have a 40% chance to hit (30% - 10% + 20% = 40%).
  - ✓ If the target is an orbital target (e.g., Orbital City, Orbital Shipyard, incomplete ship) that is *not an Orbital Defense Base*, an additional Offensive Shift is received by the attacking unit (as they cannot run). Thus, a 1<sup>st</sup> Era Warship firing at a 2<sup>nd</sup> Era Orbital Shipyard, would have a 50% chance to hit (30% - 10% + 20% + 10% = 50%).<sup>9</sup>

- ✓ Scout Ships receive one Defensive Shift in any combat to help them retreat safely.
- **A Hit:** A hit equals destruction. There are no defensive rolls, or defensive adjustments, or blocks or saving throws, a unit that is hit in combat is destroyed. Positions may develop various defensive measures to increase the survivability of their units in combat through Enhancement and Continuous Operational Technology Patents, and given the lethality of 3<sup>rd</sup> Era weapons, it is probable that this will occur.
  - ✓ “Force fields or screens? Well, again, they climb in the face of the electromagnetic theory. You can’t make the expanding wavefronts of a wavefront stop expanding. No.” – James Blish, *The Tale that Wags the God* (Kindle Locations 598-599).
  - ✓ Basic combat in GGDM may be analogized in baseball terms to star players and wannabe star players selling out, swinging for the fences at every pitch that is anywhere near the strike zone. All or nothing, homerun or strike out, no base hits. Baseball broadcasters feel like this is the trend in 2019, the ‘homerun era’ of baseball.

Additionally, if a hit equals destruction, then there is no damage and no damaged units and no need for repairs. Any damage sustained by units is assumed to be repaired following combat and/or as part of any resupply, and thus, damage does not carry from combat to combat or turn to turn. If a unit survived the combat, it was not sufficiently damaged to have been destroyed. Don’t give them a medal for it.

- ✓ Automatic ship repair is based on the time periods represented by GGDM turns and the technological capabilities inherent in the setting (e.g., possibly organic hull armor, self-repairing warships), and for ease of bookkeeping in the early parts of the game. The game does not benefit from damage tracking outside of the Combat Rounds.

---

*“The term ‘escape hatches’ is used in Transactional Analysis to describe the idea that when faced with very difficult or trying situations, some people exit the situation by carrying out one of three behaviours. These behaviours are to kill or harm self, kill or harm others or go crazy.”*

– Ian Tomlinson, “Is Closing Escape Hatches Always Possible?” Manchester Psychotherapy (UK) website, undated article, captured August 9, 2019

---

**The Heroic & Dismal:** Humans prefer games that use chance elements – dice and draws – to resolve critical issues in the game; and nothing is more chance-driven than Combat. One may quibble that strategy choices dictate the chances taken during the game – most strategy, training, organizations, and extra abilities translate basically to improving chances of success and *most strategy in dice or draw games is about stacking the odds in your favor* (i.e. Enlightenment, Combat Shifts, technologies in GGDM):

- ✓ “Three men firing at one man are usually going to win, all else being equal.” – Military Science Fiction (blog), “Types of War,” user Warcat, July 29, 2015.
- ✓ This is the key element in ‘suicide by cop’ situations; by training, the police respond to incidents with overwhelming force against individual threats. This first became necessary with the rise of armed gangs and cartels, but also is now perpetuated by domestic familial violence situations, mass shootings and modern automatic firearms

where someone can kill many in a crowded public space in a few minutes. A situation has been created where one can get the cops to do the job for you.

Still if there is any chance of failure or a chance that a bad strategy can win, it is still a game of chance. There is a chance for the heroic and the dismal.<sup>10</sup> Having an element of chance in a game allows human players a mental ‘out’ if they lose (because it was bad luck) – especially in wargames and in multiplayer games where only one can win – and to express humility for a moment (assuming they have any) if they win (because it required some luck). Each morning that you make it to work is luck – if you think of all of the things that can go wrong, you may even have experience with some (e.g., blue lights from an alien ship that turns everyone into zombies).

Although chess is a very old and intriguing game, and most Westerners have at least a passing acquaintance with chess, few truly love the game where they are solely responsible for winning or losing, one on one, against a computer or another human (losing to a chess computer or program also provides a mental ‘out’ for the human player). Humans would be unhappy in a universe that does not contain an element of chance – it gives us something to complain about, and also provides a basis for the heroic, epic and impossible and hope or dread without certainty for either; as we have learned in the last century that the underlying universe is a statistical probability, it seems probable at least that Asimov’s Robots chose this universe for our best future.

Combat die rolls make possible hope for the seemingly hopeless situation. I have played the GMT board game, *Here I Stand* (HIS, or as the players joke, *Here I Sit*) twice, both as the Ottoman Turks (the Turks cannot affect the English, although that is historically accurate). HIS uses an abstract combat system, ships roll and they either hit or not. In one game, I had a memorable naval battle with the Hapsburgs; I outnumbered the Hapsburgs nearly 2:1 and had activated the Janissaries and had a naval leader – I was rolling over twice as many dice as my opponent. No matter how many dice I rolled, I couldn’t get a hit while my opponent rolled generous hits on my ships. The massive Ottoman and corsair force went down to ignominious defeat. In a second naval battle off the heel of the boot of Italy, with significantly reduced forces, the Ottomans fared little better. Having been ambushed and blocked on the way to Vienna and losing at sea, the superior military of the Turks was neutralized, and military power is the only way the Turks can win in HIS; more so than any other power, the Ottoman Turks win or lose HIS on a few rolls.

➤ **Expendability:** We are all expendable, for any purpose or no purpose at all. Don’t assume because someone dies there was any greater reason behind it. People get killed whether executing good plans, good strategies, and following good leaders or bad plans, poor tactics, and incompetent leaders. Military personnel understand this, civilians often do not, usually blinded by false ideas that there is some connection or equivalence between moral rightness and combat results, morality and morale. Civilian leaders simply need to understand that military acts are casualties and take public and political responsibility.

- ✓ **Woman:** What mean expendable? **Rambo**, It’s like someone invites you to a party and you don’t show up. It doesn’t really matter. – *Rambo II* (1985).
- ✓ “Every man has a final weapon, his life. And if he is afraid of losing it, he throws that weapon away. And that’s what they can’t quite grasp, that I’m not really afraid. And that’s what they must understand, isn’t it?” – General Gordon, *Khartoum* (1966).
- ✓ “We’re all expendable. We think the world’s going to stop when a pope dies, or a king. And then... life goes on.” – Sylvester Stallone.

*“War is something sublime because it forces every man to face the dilemma of choosing between heroism and cowardice, between the ideal and the stomach, between the spiritual instinct to project life beyond the material, and the pure and simple instinct of animal conservation. It is the brutal discriminator that distinguishes man from man, character from character, constitution from constitution: on the one side the cowardly, the soft, the hysterical, the effeminate, the cry-babies, the mommy’s boys; on the other the strong, the aware, the idealists, the mystics of danger, those who triumph over fear and those who are courageous by nature, the hot-blooded heroes and the heroes of the will.”*

– Mario Carli, L’italiano di Mussolini (1930), Gazzola Stacchini (1991:494-5)

**The Better Part of Valor:** A successful retreat ends the unit’s participation in the combat,<sup>11</sup> and when all units of a side have retreated or been destroyed, the combat ends. Units that have successfully retreated from a combat are free to execute Actions during the next Regular Turn or join other combats later (or just retire and collect their pensions).

At the end of a combat, regardless of the results, all surviving ships have a chance of some active Constructural Elements becoming inactive. See The B-Team, 3 Disruption, p. 281, *supra*.

- **Operation Unthinkable:** Only units involved in a combat may retreat from that combat. Other units not involved remain present and may have to wait until the next Regular Turn to act. Once the combat ends, the victorious side will need to initiate a new combat to attack other positions or units that were not in the combat (except in automatic follow-through combat opportunities), i.e. they cannot continue attacking units that were not joined in the previous combat, e.g., troop transports. On the flip side, if it is desired that all ships of a side retreat from the combat, all ships of the side must first join the combat, i.e. those troop transports. Units joining a combat may attempt to retreat in the same Combat Round, *ut supra*.
  - ✓ Operation Unthinkable was the code name of the much-debated British plan for an Allied surprise attack on the Soviet forces in Germany on July 1, 1945 to drive them out of Germany. The purported political objective of the operation was to force the Soviets to abide by the terms of the Yalta Agreement with regards to Poland. The Soviet occupation of Eastern Europe was also considered a threat to Western civilization. Later planning instead anticipated Soviet attack.
- **Zigged When He Should Have Zagged:** A unit attempting to retreat from combat *may not do anything else* on the Combat Round in which it attempts to retreat. A unit attempting to retreat from a combat must have the capability of retreating; for example, colony Defense Bases may not retreat from combat (how? where would they go?).<sup>12</sup> The basic chance of a unit successfully retreating from combat is 50% *if it is not destroyed in the same round*. Units that fail to retreat, and are not destroyed, are still in the combat and may try again the next Combat Round or do something else.
  - ✓ Again, two elements come into play in retreats. First, to increase the ship’s chances of retreating, it should be placed near the top of the order so that it may benefit from an Enlightenment reroll if the retreat attempt fails. Second, combat is simultaneous, meaning that a ship might have been successful in the retreat roll, but was hit and/or destroyed by enemy fire before the end of the Combat Round. As noted in Army of

- Light, 2 Colleges, p. 479, *supra*, Enlightenment cannot be used to force enemy units to reroll successes.
- ✓ Fighter attacks are resolved first. The results may make it more difficult for a unit to retreat. Units that are retreating should be Combat Screened if possible, but that is a tactical and circumstantial decision. See Carrier Operations, 1 Carriers & Fighters, p. 1050, and Combat Screening, 3 Carriers & Fighters, p. 1067, *infra*.
  - ✓ For discussion of Carrier-Fighter and System Boat-Tender Ship retreats, see Carrier Operations, 1 Carriers & Fighters, p. 1050, *infra*.
- **Go Speed Racer!:** Unless otherwise provided, ship speed for interstellar travel has no bearing on system combats in the base game rules (or Blockade Running, see 4 Commerce, p. 1233, *infra*). Positions may, through Patents, potentially develop in-system and combat propulsion systems that give a significant edge in closing or fleeing speed and agility to their units in combat. They may also develop Doctrinal Templates to provide better rear guard and a more orderly retreat (see Combat Formations, 4 Colleges, p. 503, *infra*). But as a base-line rule, the game assumes that there is no tactical difference between the in-system and combat maneuver of the units of various positions.
- **Ship Zipped:** A unit that has retreated successfully from a *Ship Combat* without being destroyed must do one of two things:
- ✓ The ship must initiate interstellar movement to a supported system within range of the unit's remaining OSL (if possible) or to a supported system within Short Movement (see Space Hop, 2 Movement, p. 850, *supra*). This movement does not require any separate Power Activation. Retreating units may go to different locations, or to locations other than from where they originated, if they have the OSL or movement range.
    - Retreat to a supporting colony within the remaining OSL must be the first option. If one is not available, then retreat to the closest supporting colony is allowed, taking chances on Supply Rolls in FTL (see Limping Home and The Cold Equations, 3 Movement, pp. 862, 864, *supra*). There may be a few extreme, special circumstances where the Concierge may rule otherwise, but what is stated above must generally be the rule.
    - It is possible, but not likely, that the enemy would be able to know to which system the retreated ships moved; much of it has to do with interpretation of the technologies used and the nature of the Stardrives. Think of it as trying to track which way a flea jumped.
  - ✓ Or, the unit must retreat to a colony that has at least one Orbital Defense Base to cover its retreat (to hide behind!). In these instances, the unit is considered to be *at the colony* (as an enhancement) and *not in system space*. The ship retreating from a Ship Combat may retreat to a colony engaged currently in Colony Combat, and automatically 'joins' that combat as a defender (or maybe attacker). The colony to which the retreat is made does not need to be a sovereign colony of the ship's owner, it may be an **alien colony** if the owner consents to shelter the retreating units. Implicit in any shelter is the idea that the colony will (attempt to) protect the units from pursuit.
  - ✓ Retreating to a colony may trigger the follow-through 'free' combat initiation against colonies (*ut supra*) because the retreated units are *not in system space*. Units that

have retreated to the colony may join any subsequent defense of the colony (if able) and/or may retreat again.

- ✓ If you are wondering about surrender options, well ... that's a whole different issue. See 5 Combat generally, *infra*. But there is a very good argument that ships which cannot safely retreat may fight to the end against *alien forces*.
- **Combat Re-formation:** Attacking units retreating from a *Colony Combat* must retreat either to system space or to a colony in the same system (*ut supra*). Ground Units involved in a Ground Combat may only retreat if they can be lifted from the planet surface to available transports (see Ground Combat Resolution, 4 Combat, pp. 993-994, *infra*). The Concierge may determine that stranded Ground Units have surrendered, attempted to surrender, or scattered (see Win, Place or Show, 5 Combat, p. 1010, *infra*).

---

*“Proportional response only makes sense when the playing field is even. We have a distinct advantage here. Problem is the other side just doesn't realise how wide the gap is. What they really need is a visual aid... Don't worry, there's no threat of residual radiation spreading. It's quick and clean – it's like cutting your enemy's heart out with a scalpel.”*

– Daniel Jackson, *Stargate SG-1*, “Absolute Power” (2001)

---

#### Endnotes.

<sup>1</sup> **Citation:** “‘And don't tell me God works in mysterious ways,’ Yossarian continued. ‘There's nothing mysterious about it, He's not working at all. He's playing. Or else He's forgotten all about us. That's the kind of God you people talk about, a country bumpkin, a clumsy, bungling, brainless, conceited, uncouth hayseed. Good God, how much reverence can you have for a Supreme Being who finds it necessary to include such phenomena as phlegm and tooth decay in His divine system of Creation? What in the world was running through that warped, evil, scatological mind of His when He robbed old people of the power to control their bowel movements? Why in the world did He ever create pain?’” – Joseph Heller, *Catch22* (1961).

<sup>2</sup> **Commentary:** Plaintiff Attorneys need Defense Attorneys, Defense Attorneys need Plaintiff Attorneys, see?

<sup>3</sup> **Commentary & Citation:** Initiative is a part of morale, see Morale discussion 5 Combat, p. 1006, *infra*. Two extremes of initiative:

- ✓ In the days of Napoleon's stunning victories, commanders from top to bottom displayed initiative and everyone was involved and enthusiastic (near certain victory tends to do that), to an extent unheard of in European armies which had heretofore resembled cattle (the Netherlands taxed Hessian mercenaries as cattle when crossing their territory to seaports). European military professionals aiding the American Revolution noted the difference between European soldiers and American soldiers; the former immediately did as ordered, the latter asked for an explanation why, then did sort of what they were ordered to do.
- ✓ On the other end of the spectrum is the entire underperformance of UNPROFOR in Bosnia-Serbia and in particular the 370 soldiers of Dutchbat III, who stayed in their building and did nothing to stop the genocide/massacres and rapes that they knew were happening at Potočari, that happened right in front of them, *as established by court testimony*. They were not willing to become the modern 300 – whatever their orders may have been – to protect refugees against strong Bosnian Serb VRS forces. This is forever a stain on the army of the Netherlands, which suffered so much under the Nazi German occupation.
  - Cf. Dutchbat III at Potočari to Charles George Gordon at the Siege of Khartoum (1884-1885). His decision to actively resist instead of evacuating (disobeying orders) forced the British government to send a relief force, though they did dally in the task until public opinion forced their hand.

<sup>4</sup> Commentary: Defense attorneys love dilatory tactics and it is usually the responsibility of the Plaintiff's attorneys to drive the case along, frequently by threatening the file motions with the court. However, sometimes Plaintiff attorneys play the dilatory game hoping for outside events to help their case or because their case has problems.

<sup>5</sup> Commentary: As mentioned in *Defending the Nothingness*, 2 *Combat*, pp. 956-958, the cordon defense is defeated by the military doctrines of concentration of force and defeat in detail, and this is true of colony Defense Bases. So, theoretically, the approaching attack fleet will only battle a portion of the colony's defenses at a time, but must eventually *battle all of the colony's defenses* to defeat the colony. On the other side of the concept, within the time periods represented by GGDM, this process is abstracted by allowing all units of both sides in a combat to fire each Combat Round, with the note in *Something Here From Somewhere Else*, 2 *Combat*, p. 960, that System Defense Bases, because of their first Combat Round isolation, can be defeated in detail, especially without Fighter support.

- ✓ This is an area where enterprising players could develop Doctrinal Templates (see *Combat Formations*, 4 *Colleges*, p. 503, *supra*) for attack in Colony Combat while the defenders may counter with their own Doctrinal Templates and perhaps enhancements to increase mobility and range of Defense Bases to allow them to counter-concentrate.

<sup>6</sup> Citation & Commentary: “The influence of the American Revolution is evident in the skirmishing tactics. In addition to Lafayette, Jourdan and Berthier, scores of lesser officers had seen service in Rochambeau's expeditionary force. They returned with enthusiasm for American methods; and as the organizer of early National Guard units, Lafayette included a rifle company in each battalion. The weapon itself does not appear to have been widely adopted in the new French armies, but Hondschoote and later fields indicate that lessons had been learned in marksmanship and taking cover. Most of the Revolutionary tactics, however, sprang from necessity rather than precept or theory. Lacking magazines, Carnot's troops became less dependent on bases and lines of communication. Lacking tents, they learned to bivouac in the field where all units could be readily concentrated. Lacking supply wagons, they marched at twice the speed of better provided opponents. Thus were Guibert's doctrines of mobility put into effect – not through army reforms, as he had hoped, but by dint of military poverty!” – Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 455.

- ✓ This is one of the many ways in which the American Revolution, half a world away, can be strangely said to have enabled Napoleon's rise (an emergent event), which is, of course, linked to the later Louisiana Purchase (1803) because he needed cash and could not defend New Orleans against the British in any case.

<sup>7</sup> Commentary: Abstract combat resolution was made popular by the *Axis & Allies* board game in the early 1980s. Note however, that other games, for example, *Stellar Conquest* (1976) were using the same system prior to *Axis & Allies* and its family of similar games (e.g., *Conquest of the Empire*, *Shogun*). The popularity of the *Axis & Allies* style combat system was such that rolling lots of six sided dice to resolve combat between non-unique units became a derisive mark of the late 1980s- early-1990s American board game (e.g., *Shattered States*).

<sup>8</sup> Commentary: e.g., *Imperium* 3<sup>rd</sup> Ed (2001) of which many complained that 3-D combat added nothing to the game, or the *Saganami Island Tactical Simulator* (based on the *Honorverse* books) of which I played in a demonstration at a big convention long ago (it was probably the 1<sup>st</sup> Edition).

<sup>9</sup> Citation: “In one of the bitterest blows of the Black War yet to befall the Diaspora Sector, Solomani forces launched an attack on Hice's class A starport using thermonuclear weapons. This attack completely destroyed the starport and, it is believed, killed a substantial portion of Hice's populace.” – *Traveller News Service* (*Traveller RPG*), *Imperium* Date 345-1124.

<sup>10</sup> Commentary: In one game of *Red Storm Rising*, a Dutch battalion held off six Soviet divisions for several turns.

<sup>11</sup> Commentary: Get your tail section blown away, live to fight another day!

<sup>12</sup> Commentary: That would be an interesting technology: The ability to teleport Orbital and System Defense Bases. A mobile defense base force. In some sci-fi universes, interstellar navies develop heavily armored starfortresses that are slow moving, but serve as the command and logistical center of a fleet position in a ship battle.

- ✓ In *Ender's Game* (movie, 2013) the Formic – a collective, hive intelligence – attack on Earth literally falls out of the sky when the war hero, Mazer Rackham, notices that all of the Formic ships are rotating around a large ship in the center and crashes his fighter into the Queen ship from above. Like an unexpected whack on the back of the head!

*See Appendix CST – Combat Shifts & Situations Tables*  
*See Appendix EPAT1 – The Existential Patents*  
*See Appendix EPAT2 – Existential Patents Quick Summary*

*“At the outset it was evident that the staggering casualty list had been no accident. Battle losses were bound to be severe when soldiers advanced shoulder to shoulder, halting at the word of command to trade volleys at distances suited to dueling pistols. Only an iron discipline could nerve men to keep reloading and firing while they stood firm amid the heaped-up bodies of writhing and motionless comrades. Only years of drill could school them to close up their tattered ranks and march forward with the bayonet at the slow and solemn pace of eighty steps a minute.”*

– Lynn Montross, War Through the Ages (3<sup>rd</sup> Ed., 1960), p. 336 <sup>1</sup>

**Shoulder to Shoulder:** Factors of commonly misunderstood 16<sup>th</sup>-19<sup>th</sup> Century Linear Warfare:

- ✓ Muskets were heavy, single shot and had about a 20% misfire rate on a *dry day*.
- ✓ Accuracy fell off sharply after 50 yards, thus soldiers lined up shoulder to shoulder.
- ✓ Until the late 19<sup>th</sup> Century, gunpowder weapons produced a big cloud of thick smoke, thus bright uniforms were necessary to distinguish combatants in a close smoke shrouded battlefield, this also affected command, because once the shooting started, the general on the hill could only occasionally see the unit banners, communication was by messenger or bugle.
  - In the thick shroud of smoke, when figures emerged close in front of you, you had 5-15 seconds to decide friend or foe. Forget all those movies you’ve seen, most are filmed with smokeless powder. Thus bright colored uniforms served to distinguish units in the thick smoke; a Canadian unit wearing green uniforms was fired upon in the thick smoke by a British unit in the War of 1812 because they weren’t wearing red.
- ✓ Europe was by that time mostly cleared and improved farmland, vineyards and small towns, open fields, roads were common, so linear formations were not problematic in Europe (contrast with the terrain of North America).
- ✓ Musket and bayonet replaced pike and arquebus, lines and squares had been the standard military formations for millennia: linear musketry required men to stand close together and advance slowly, stiffly in line to avoid confusion and friendly fire.
- ✓ “They believed that in order to mash your enemy, you had to mass your men, so he lined up shoulder to shoulder and went forward, and a good deal of dependence on the bayonet frightening the enemy into retreating. There were a few bayonet wounds in that war. And this lining up shoulder to shoulder and advancing was the reason for the huge casualties they suffered.” – Shelby Foote undated audio interview, talking about Pickett’s Charge.

*“Leave it to the infantry to ruin a guy’s morning.”*

– Garibaldi, *Babylon 5*, “GROPOs” (1995)

**GROPOs:** Ground Units are regular, equipped and trained armed units that do not normally function as police forces. No Patents or special technology is required to build Ground Units, any position or Minor Race can build Ground Units from the beginning of the game.

Ground Unit size is measured in population and RPs. Ground Units are built (or added to) by activation of the Construction Power for the purpose of Colony Enhancement, using one half population factor for each 1 RP added; Ground Unit size for combat is measured in RPs. All colonies on a Balkanized Colony Planet may have their own Ground Units and may peacefully (or not) co-exist. Population Factors in Ground Units on *any* colony count toward the colony planet's Maximum Habitability, do not produce RPs during Taxation, but will grow normally during Census (eating and breeding!)<sup>2</sup> if on a colony of their Native Population Type.

- ✓ Surface colonies on a Balkanized planet may initiate Ground Combat against each other.
- ✓ “By the following summer universal conscription had increased French numbers to nearly three quarters of a million – the greatest horde ever seen in Europe since the barbarian migrations. ... The last traces of the old regime had vanished along with such famous regiments as Picardie; and all units now wore the blue uniform of the National Guard, being designated by numerals instead of names.” – Lynn Montross, *War Through the Ages* (3<sup>rd</sup> Ed., 1960), p. 455.
  - This approach can be seen in the movie *Paths of Glory* (1957) where all of the French officers and soldiers wear their regimental number prominently etched into the collar of their uniforms (in the movie ‘701’ is prominently displayed on most of the uniform collars, except the General-grade officers and staff attachés).
- ✓ *The Alterity Factor*: There are communal eugenic creatures on Earth where every individual is both a natural warrior and a worker, for example, ants and bees. It is possible in GGDM to have technologically advanced alien races along these lines which makes the entire population of the colony a single, probably non-divisible, huge Ground Unit that can also produce in Taxation and grow with the Census, if not involved in a Ground Combat. I designed a game like that when I was about 15.
- Ground Units: Ground Units can be distinguished mechanically from Fighter Complements in the following ways: Ground Units are not an Enhancement Technology (there are no Patents required to build Ground Units), and they can exist independently as a unit away from a colony or ship as long as they are supplied by Log Ships. Compare with Fighters, see *On The Flight Deck, 1 Carriers & Fighters*, p. 1047, *infra*. This makes Ground Units a limited unit in the game, not quite like ships or colonies (see *View From a Height, 1 Construction*, p. 660, *supra*), but not always and only an enhancement to a ship or colony, as are Fighters.
  - ✓ *Minor Races*: The armaments of Ground Units from Minor Races probably makes them inferior. I once played in a Traveller RPG game where a Tech Level 8 world (1980s technology) was invaded by a Megacorporation (Megacorporations have private armies and navies in Traveller) using Tech Level 12-14 armies and warbots. Most people with even a passing knowledge of history can picture Era differentials in land warfare, because we are land dwellers. But I would not bet too heavily against 300 Spartans vs. 300 18<sup>th</sup> Century European line infantry (30% hits at 100 yards, 3 volleys per minute); the muskets will do their damage during the charge, but the guys with bayonets will be in big trouble when the Spartans close for *mano-a-mano*.

- Sepoys in Space: Since Ground Units may be created from Naturalized Colonies, Native Population Type will be a factor.<sup>3</sup> Ground Units garrisoning colonies that are not of their Native Population Type are possible trouble.<sup>4</sup> The Native Population Type of a Ground Unit is also a factor in the Habitability Class of the planet on which they land (*ut infra*).
- Lift & Separate: Ground Units stored in Orbital Cities may not participate in Ground Combat or any other surface activity without being landed. They may be loaded and transported on special transport ships, whose capacity is measured in population of Ground Units that can be transported.<sup>5</sup> Thus, it is possible through technology to increase the RP cost/value of Ground Units per half-population factor. Ground Units may be split between ships for transportation purposes. Ground Units may be left behind while others are lifted or evacuated. A position may build Ground Units for security without the ability to transport or land them.
- Troop Transport Technologies: Troop Transport ships do not have an Existential Patent, the technology will need to be invented and will probably be a modification of the Colony Transport Existential Patent (if landing troop transports) or the 1<sup>st</sup> Era Carrier Existential Patent (if using expendable drop ships). Lifting Ground Units should be similar to transferring Fighters between colonies and ships and not like Loading Population to Colony Ships. A large part of what is called *military efficiency* is the ability to move large numbers of persons and specialized equipment quickly and *in an orderly manner over distances* and *keep them in fighting condition*.<sup>6</sup> Moving military units is not like transporting civilian population; military units are specialized and not self-supporting. And going is not voluntary.

Every rule concerning Ground Units may be altered or enhanced by an appropriate Patent or Doctrine;<sup>7</sup> Colleges may be established for Ground Combat, Enlightenment may be used in Ground Combat. It is possible to build heavy ground units, fortifications (installations), specialized ground units, and ground units consisting of only droids/warbots.
